This quarter's circulars, relating to Canada, the Australasian and South African Colonies, have just been issued by this office, under the supervision of the Colonial Office; and a poster, giving a summary, is exhibited in every Post Office. Queensland grants free passages to female servants and selected agricultural labourers. Western Australia, Queensland, and Canada grant assisted passages, and the two former and Natal nominated passages at reduced rates—mainly to female servants and agriculturists. Farmers with capital, and female servants, are wanted in all the colonies; and agricultural labourers in Canada, New South Wales, Victoria, Queensland, Tasmania, and New Zealand; while mechanics and general labourers are only in demand in very few localities. Intending emigrants are invited to write to the office as to the arrangements (if any) which are made by Colonial Governments, and in some cases by private committees and individuals in the colonies, for the reception and assistance of emigrants on landing. The circulars are to be obtained, free of cost, from the office—31, Broadway, Westminster, S.W.; and ten separate handbooks, with maps, one for each colony, at 1d. each, post-free.

FLORENCE.—

The Royal Horticultural Society of Tuscany, as the daily papers have recorded, presented recently a basket of flowers to our QUEEN, now sojourning at Florence. From our Florence correspondence we are enabled to add some particulars of this elegant mark of courtesy. The gift was accompanied by the following lines:—

"Our Flora's bowers, proud to receive
The visit of Great Britain's Queen,
With pressing courtesy beg leave,
As welcome to this Southern scene,
Within her angust hands to lay
These blooms that thrive where Britons sway."

The last lines refer to the fact that the offering was entirely composed of plants originally native of some part or other of HER MAJESTY'S dominions. Thus, there were Himalayan Rhododendrons, Indian Dendrobis, Burmese Vandas, Aërides, Cypridiums, &c., intermixed with Freesias from Natal, Ericas and Amaryllis from the Cape, Acacias, Epacris, Chorozema and others from Australia. Of course General Ponsonby returned a gracious acknowledgment on the part of HER MAJESTY.

SEED EXCHANGE LISTS.—

We have received seed lists from the Royal Botanic Gardens, Glasnevin, Dublin; the Royal Botanic Gardens, Kološvar, Transylvania (Claudiopolis), Palermo (*Hort. Bot. Reg., Panormi*). In this latter the plants are arranged under their orders in alphabetical sequence, as also the orders themselves within the classes. A few botanical notes are added by the Director, Dr. TODARO.

STRAWBERRY FORCING AT HECKFIELD PLACE.

—Mr. WILDSMITH is now picking very fine and highly coloured fruit of Vicomtesse Hericart de Thury. This and President are the two principal varieties forced—the former for his earliest crop. The first forced batch of 500 plants are grown in 48-sized pots, and Mr. WILDSMITH asserts that it is a positive advantage to have the plants in small pots when they are wanted for early work, as the pots become filled with roots, and the plants are enabled to bear hard forcing. One remarkable fact is mentioned by Mr. WILDSMITH. He says that while this particular variety can be so successfully forced at Heckfield, none of his foremen who have left him and gone to other places, have proved so successful with it as when with him. In reply to an enquiry as to the probable cause of this failure, Mr. WILDS-

SMITH can only hazard the conjecture that there is perhaps something in the soil, or possibly in the atmosphere of Heckfield that suits this particular variety, and these conditions are wanting.

"A NICE DERANGEMENT OF EPITAPHS."—

The pitfalls provided for the unwary by botanical nomenclature are varied and deep. Here is one, which, in its Ibernicism, is delicious. A correspondent sent us a note headed "bromus philippense the sweet-scented Broom from the Philippine islands." This naturally attracted our attention, for while we doubted whether the Philippine Islands were possessed of a Broom; we knew Bromus to be certainly a grass of which we know too much at home, but of whose existence in the Philippine Islands we also had strong doubts. Fortunately a specimen was at hand which cleared up the triply involved mystery. The plant turned out to be the beautiful and very fragrant *Cytisus filipes*. *Cytisus* may stand for Broom (not for Bromus), while the designation of the slender stalk of the flower (*filipes*) was here perverted into association with the Philippine Islands. Had the Canary Islands been mentioned it would have been nearer the mark.

CYPRIDIDIUMS.—

A useful list of 341 species, hybrids, and varieties of *Cypridium* which appeared in *Le Moniteur d'Horticulture* of March 25 is now issued as a separate publication. It professes to be the most complete list published, and any omissions will be presented at a later date, so as to make it complete. In the case of hybrids the parentage is given. The *Selenipedium* section and those with annual leaves are distinguished in the list before us.

THE LATE DR. LATHAM AND THE SPELLING OF "POTATOS."—

The recent death of this distinguished philologist and botanist recalls the question of the spelling of the word Potato in the plural. As many of our readers must have noticed—and as some from time to time remind us—it is the practice in this journal to spell the word in the plural without the *s*, thus—Potatos. The origin of this peculiarity is lost in obscurity. The Editor found it a tradition of the office on his accession to the editorial chair, and determined, if no good reason were shown to the contrary, to abide by the old practice. The tradition current in the office is that the peculiar spelling was in the first instance a pure accident, but that Dr. LINDLEY, who took strong views of things, determined to avail himself of a privilege which other journals, such as the *Times*, also adopt, of spelling particular words as they think fit, provided they are not absolutely incorrect. In any case, some years ago the present Editor submitted the case to Dr. LATHAM, then one of the correspondents of this journal, than whom no more competent authority could have been appealed to. Dr. LATHAM'S reply was of such a nature as to induce the Editor to retain the practice, for, said the lexicographer, it is not wrong; it is simply in advance of the times. Sooner or later all such words which have no "e" in the singular (*volcano, calico, &c.*) will also be spelt in the plural without the "e". As the *Gardeners' Chronicle* has always endeavoured to keep at least abreast of the times, if not in advance of them; the mode of spelling which thus received some sort of an endorsement, has been continued.

PORTUGUESE NARCISSI.—

In the lately issued part (3, 1887) of the *Boletim da Sociedade Brotariana* Professor HENRIQUES gives the following enumeration of the species of *Narcissus* found wild in that country:—*N. Bulbocodium, nivalis, pseudo-Narcissus minor, cyclamineus, calathinus, triandrus, odoros, rupicola, jonquilloides, minutiflorus, Tazetta, intermedius, biflorus, serotinus, and Gaditanus*. *N. cyclamineus* was described by PANKINSON in 1640, and figured in *Rudbeck Theat. Flor.*, 20, but not having been seen for many years was considered by Dean HENNER as a figment. The Dean says of the plant represented in Rudbeck's figures:—"I have no hesitation in rejecting it as a nonentity," a statement

which shows that Deans are fallible. Professor HENRIQUES' enumeration is accompanied by some critical notes on the species in the Portuguese tongue.

DUTCH FLOWERS.—

The President of the Royal General Union for the cultivation of flower roots (Mr. J. H. KRELAGE, Haarlem), sends the following communication:—

"In July of last year communications were made to this journal concerning the plans of the Royal General Union for the cultivation of flower roots (Haarlem), which was to do all in its power to stop the trade in cut flowers which was considered so very injurious to the bulb-trade. Resolutions on this subject were passed at the sixty-eighth general meeting of the Union, held on January 30 last, and at the sixty-ninth general meeting held on March 26 last, the results of the Union's operations in this direction were communicated. At that date 2081 bulb growers and bulb tradesmen had signed a declaration that they would not sell cut flowers of Hyacinths, Tulips, Narcissus, Ranunculus, and Anemones for trade, and that they would not deal with those persons who sold such flowers, or who refuse to sign the declaration. The number of signatures is daily increasing. On the other hand there were only 107 names on the list of those who refuse to sign, and there is all probability that this number will decrease. From these facts it may be concluded that the measures taken have received general sympathy."

POTATO SCAB.—

The following results were arrived at at the comparative experiments by Mr. BECKWITH, of the New York Agricultural Station, with reference to this subject:—

"The scab is not primarily caused by a fungus.

"It is not due to the work of insects.

"In nearly every instance an increased yield was accompanied by an increased percentage of scabby tubers.

"Any marked change in the rapidity of growth, either an increase or a decrease, leads to an increased production of scab.

"A continuous growth from the time of first vegetation until the tubers are fully matured appears to be the condition least favourable to the production of scabby tubers."

EFFECT OF HEAT, &C., ON POLLEN.—

The resistance of pollen to various external influences is, says *Nature*, the subject of a recent inaugural dissertation by Herr RUTTENBERG in Bonn (*Naturf. z.*, 1888). As to temperature, he found most pollen able to bear 90° C., half an hour, without losing the power of germination. A temperature-maximum was reached at 104°·5 for ten minutes. In conditions favouring germination, pollen does not bear such high temperatures as in the air-dry state. A moderately raised temperature (32° C.) accelerates growth of the pollen tubes. Low temperatures (*e.g.* under 9°) prevent germination, though a cooling to 20° for forty minutes can be borne without injury. As to liquid chemical reagents, the plasma of pollen proved very sensitive to antiseptics (more so, as a rule, than micro-organisms), but the resisting power is pretty different in different sorts of pollen. Chloroform vapour acting for twenty minutes was fatal, bromine vapour in five minutes, ammoniacal vapour in ten to twenty minutes. Rotation, several hours, of a spherical vessel holding pollen with nutritive solution, did not prevent free germination. The retention of the power varies widely in different plants. Thus, *Cyclamen* lost it soonest, in seventeen days; while *Clivia* and a *Narcissus*, still had it on the sixty-sixth day in (*Pæonia* fifty-eight, *Camellia* fifty-one, *Azalea* forty-two). The average is thirty to forty days.

PLANTKUNDIG WOORDENBOEK VOOR NEDERLANDISH-INDIE . . . VOOR G. J. FILET.—

Mr. J. H. DE BUSSY, of Amsterdam, has published a dictionary of the vernacular names of plants as used in Java, Celebes, and other islands of the Dutch Indies. To each native name is appended the botanical appellation, and that of the natural order to which the plant belongs. In many instances additional particulars relating to the plants are also given, but as these are in the Dutch language, they

will be nearly as inaccessible to readers of other nations as the Malay names themselves. An excellent feature of the book, and one of cosmopolitan value, is the index of Latin names which thus forms a catalogue of the most noteworthy of the plants of the Archipelago.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The annual report, balance-sheet, and list of members of this Society has just been issued, and any one interested in it can obtain copies on application to the Secretary, Mr. W. COLLINS, 5, Martinhoe Terrace, Martindale Road, Balham, S.W. There are now thirty honorary members subscribing one guinea per annum, and 240 ordinary benefit members. But such a society—so helpful to habits of thrift and forethought—ought to have 1000 members at least, considering the number of gardeners throughout the United Kingdom who are unconnected with any such institution.

PROFESSOR PLANCHON.—The *Times* of Wednesday contains an announcement of the death of Professor PLANCHON, of Montpellier, who we may add, commenced his botanical career at Kew, as curator of Sir WILLIAM HOOKER'S herbarium, which he enriched with many critical notes. M. PLANCHON subsequently acted as Botanical Editor of the *Flore des Serres* for M. VAN HOUTTE, and was a constant attendant at all the important horticultural and botanical congresses. We shall refer again to his labours in a subsequent issue.

HORTICULTURAL CLUB.—The monthly dinner of the Club will be held on Tuesday next, at 6 P. M., at the Hotel Windsor, Victoria Street, nearly opposite the new offices of the Royal Horticultural Society. The discussion on Tuesday next will be on Daffodils, and opened by Mr. WALKER. We believe it is intended shortly to remove the Club to the Hotel Windsor, as convenient to the new premises of the Royal Horticultural Society. This is one of those indications of federal union between the Royal Horticultural Society and other bodies which we hope to see multiplied on all sides.

WATFORD CHRYSANTHEMUM SOCIETY.—Mr. CHAS. R. HUMBERT, Hon. Secretary and Treasurer, Watford, Herts, writes that the third annual exhibition of Chrysanthemums and other autumn flowers and fruits will be held in the Agricultural Hall, Watford, on Tuesday and Wednesday, November 13 and 14.

THE MANUFACTURE OF SUGAR FROM SORGHUM.—The British Consul at Chicago, says the *Times*, in a report laid before Parliament (Miscellaneous Series, No. 83), describes the results of experiments made during the past seven years in the United States to obtain sugar from Sorghum-juice. Aided by Government grants, these experiments were so successful last year that they have, "it is confidently believed, placed Sorghum sugar-making among the profitable industries of the country." The State of Kansas has been the first to demonstrate that it is practicable to extract sugar profitably from Sorghum. The Consul states that the experiments show that, taking 7½ tons of clean cane as an average yield per acre of land cultivated with Sorghum (and good cultivation can increase the yield to 10 and even 12 tons), this will produce 750 lb. of sugar, 1000 lb. of molasses, 900 lb. of seed, 1500 lb. of fodder, and 1500 lb. of exhausted chips (dried), and that the total value of sugar, molasses, and seed is about £11 18s. For the corresponding gross yield of 10 tons of Sorghum, at 8s. per ton, the farmer will make £4 per acre on his crop, or more than double the yield of a crop of Wheat or Corn [Maize]; while as a gross product of agriculture and manufacture it is said that six times as much per acre will be realised from this industry than is usually realised from cereals in the State of Kansas. Sorghum seed is said to be of about equal value with Corn for feeding purposes. Mr. FISHER describes in detail the working of one of the experimental factories during 1887, and the various processes

through which the cane goes. The farmer's part is the most important of all, and it is thought that much may be done by experiments to improve the canes, on the same principle as Beet for sugar has been improved, viz., by careful manuring, producing different hybrids, and preserving seed only from such cane as has been shown by analysis to contain the greatest amount of sugar. It is also thought that the length of the season for working Sorghum may be extended by the development of earlier varieties and by cultivation.

NEW YORK AGRICULTURAL STATION.—The report of the Assistant Horticulturists for 1887, deals with the results of observations and experiments with reference to Potato scab, injurious insects, trials of vegetables and fruit.

THE WILTS HORTICULTURAL SOCIETY.—The date of the summer show of the above Society, to be held at Salisbury has been fixed for Thursday, August 23.

PEACHES IN MARCH.—We note in the *Journal of Horticulture* a statement that Mr. KING, gardener, Devizes Castle, gathered a dish of Early Alexander Peaches on March 26, from trees planted out in a mixed Peach-house. Forcing was commenced on November 15. The prices which Peaches fetch in Covent Garden at this season should encourage others to follow Mr. KING'S example.

BOLTON AND DISTRICT CHRYSANTHEMUM SOCIETY.—The committee of the above Society has issued the balance-sheet of its first exhibition, from which it appears that the exhibition was very successful. The balance-sheet shows a balance in favour of the Society, amounting to £15 12s. 10d., a sum which has induced the committee to offer a more extensive list of prizes for the next exhibition, which will be held on November 23 and 24.

PUBLICATIONS RECEIVED.—*Report of Papers read before the Preston and Fulwood Horticultural Society, 1886-7* (Preston: GREENALL, Cannon Street).—*Der Obstbau, No. I, viii, year* (Stuttgart: W. KOHLHAMMER).—*Mrs. Caudle's Curtain Lectures*. By DOUGLAS JERROLD. (London: BRADBURY, AGNEW & Co., Bonny Street, Fleet Street, E.C.)

NOTICES OF BOOKS.

THE FLORA OF WEST YORKSHIRE.

Under this title, Mr. F. A. Lees has published (Lovell Reeve & Co.) a complete enumeration of the flowering plants and Ferns, with a less detailed list of the other cryptogams found in the West Riding of Yorkshire. To a large extent the work is modelled on Mr. Baker's *North Yorkshire*, and it is no small praise to say that the present work bears comparison with its predecessor. The chapter on climatology is well written, and occasional reference made to the facts that may be gleaned from gardens as to the effect of frost on (so-called) hardy plants. We could have wished that so competent an observer would have indulged in a longer *excursus* of this kind, but he probably thought that a volume of 843 pages was already sufficiently bulky. Nevertheless, there can, we think, be no doubt that the elaborate record of the particular localities given for every plant of no matter what degree of importance or rarity occupies space in local Floras of this kind which might be filled with matter of greater value for scientific purposes. The distribution of those of our native plants sensitive enough to external influences to be indicators, according to altitude and climate, though few in number, might afford useful lessons to cultivators of fruit trees and vegetables. At any rate, a little more co-operation between the gardener and the botanist would in this, as in so many other cases, prove advantageous to both. The writer of the Flora before us has apparently not met with the elaborate Frost Report, edited for the Scientific Committee of the Royal Horticultural Society by the Rev. George Henslow, and wherein he would have found various illustrations of many matters treated of in his introductory remarks.

The incidental notes, which are specially interesting to a stranger to the county, are numerous and sometimes valuable. The large number of casual or alien plants introduced from abroad with wool or foreign agricultural seeds is worthy of special attention.

"For those who want a downright good botanical puzzle and a rousing lesson in plant-character, by the way, these foreign weeds answer admirably. It is only necessary to purchase a stone or two (!) of hen-corn at different mills, strew it at intervals in spring on waste garden ground, allowing fowls a few minutes to pick the Wheat, and in a few short weeks *voilà!* a parterre more bewildering to the lover of the botanically curious in its variety than it is possible to attain other ways with so little trouble."

Good indexes are given to the introduction and other sections of the book, but we should have been glad had it been possible to have indicated in the index also the "habitats" of the author's personal observations, upon which we alight at present in haphazard fashion as we turn over his pages, and which are in general very well worth reading. In any case we may congratulate him and the Yorkshire Naturalists' Union on the publication of a local Flora of very great merit.

PLANT NOTES.

TOXICOPHILEA SPECTABILIS.

This is a very useful plant for winter flowering and for cutting purposes. It is very floriferous and the flowers are strongly scented.

In habit it resembles an *Ixora*, the leaves are opposite, elliptical, and dark green; and the white flowers are produced in cymes springing from the axils of the leaves as well as from the terminal buds. For bouquets of all kinds, and wreaths, the dense bunches of bloom can be used as substitutes for Bouvardias, which they somewhat resemble, Jasmine, &c. The natural time of blooming is early summer, but the period may be altered by certain methods of cultivation, and some years ago I used to grow them in the stove, but of late years I do not grow the larger plants there at all—only the small or young stock—the old plants being grown in the vineries during the summer, and only introduced from time to time into heat so as to keep up a supply of flowers. Our plants have been in bloom more than three months and we have cut flowering shoots from 1 foot to 4 feet long, by the armful. The plant is a native of South Africa, and is, as its name indicates, of a poisonous nature.

Propagation is effected by means of cuttings, layers, and seeds, and the best soil for them is composed of two parts peat, one of loam with a considerable addition of sand; good drainage is a vital necessity. *A. Evans, Lythe Hill*. [This plant was fully described, with an illustration, in *Gardeners' Chronicle*, March 16, 1872. Some very robust, well-flowered shoots of the plant, together with the fruits, which we had not previously seen, accompanied the above note. En.]

AZALEA DEUTSCH PERLE.

This fine white Azalea will, without doubt, be increasingly grown as its excellent all-round qualities become more fully recognised. We have been struck during the past few weeks with the lasting properties of its flowers, no doubt enhanced by the fact of their being semi-double, and of good substance. Each flower is supported by a stout foot-stalk—an essential point when used in a cut state. The plants themselves bid fair to be of vigorous growth, more particularly those that have been increased by grafting. We are also growing the variety on its own roots; these promise to make sturdy little stuff, and are likely to prove useful when propagated in this manner for decorative purposes rather than for growing on into specimens. The purity of colour and beautiful form of each flower

add much to the attractiveness of this addition to Indian Azaleas. *J. Hudson, Gunnersbury*

AZALEA OBTUSA.

This species is not seen in private collections nearly so often as it should be. In growth it resembles *A. amœna* somewhat, and flowers well under the same conditions of culture, and is a capital companion to that kind, but with flowers of an orange-red colour. Lately I saw it thriving well and flowering freely with Mr. Foreman, Carlton House Gardens, Herne Hill, S.E., who sets great value on it for early work, growing several specimens for that purpose. Plants propagate easily from cuttings, and succeed well under the ordinary conditions of cultivation. *J. H.*

TREES AND SHRUBS.

ARNOLD ARBORETUM.

THE plan adopted for preserving the record of each of the type trees in this Institution is as follows:—“The holes occupied or to be occupied by the trees are numbered in sequence, and the number of the bole stamped into a small metal label securely attached to the tree planted in it. The exact position of each hole is carefully plotted, so that the maps show the actual position of each tree with the number which appears on its label. Accompanying the maps are records showing the name of the tree, the source whence obtained, the date of transplanting, and their height at the time. In the case of grafted trees the date when they were grafted and the nature of the stock are recorded.

A HYBRID POPLAR—POPULUS STEINIANA X.

Mr. Bornmüller, the Inspector of the Botanic Garden at Belgrade, figures and describes in the last number of the *Gartenflora* a Poplar found by him on the western coast of the Black Sea, near Varua. The young branches are described as hoary when young, afterwards glabrous; buds hoary, petiole compressed; leaves hoary beneath when young, subsequently glabrous, deltoideo-triangular, acuminate, lobed, toothed. The flowers and fruit are not known. The tree is named in honour of Mr. Stein, of the Botanic Garden, Breslau.

HALESIA HISPIDA.

What a pity it is that so beautiful and distinct a shrub is so uncommon; for we question much if it is to be found in a score of gardens in this country. (For illustration see *Gardeners' Chronicle*, vol. xxii. p. 177.) The flowers are of the purest white, very abundantly produced, and of remarkable substance. They hang in long triangular-shaped racemes, and impart to the plant during the summer months a most interesting appearance from their graceful arrangement and peculiarity of shape. It is quite hardy, and when thoroughly established grows with the freedom of a Laurel. *A. D. Webster.*

FORESTRY.

OAK FOR ESTATE WORK.—Taking into consideration the very low figures which are now obtainable for all except the very choicest descriptions of Oak, it would appear that there was never a more appropriate time for determining how far Oak wood is applicable to the general purposes of the estate. Even within the last decade Oak of moderate quality has sold for very fair prices, but in the last two or three years there has been a great change. At the present moment, reckoning of course the market value of the wood in the rough, Oak scantling can be cut out at a very small percentage in advance on the cost of imported deal. It is, therefore, clear that where durability is of paramount importance the conditions are greatly in favour of the substitution of Oak. This would largely apply to the chief buildings on a place, but as this is perhaps a little out of the scope of an ordinary forester's or estate

manager's business, I will endeavour to point out a few of the minor purposes to which it can properly be put. One of the chief of these is fencing, a class of work so wide and varied as to require almost every quality wood, from the roughest to the best. Since the cost of iron has relatively been so little, it has been the practice on many estates to employ it more extensively than was the case a few years ago, and in some situations there is no doubt that its effect is very good. Nevertheless, in the great majority of positions, so far as appearance is concerned, there is no reason why an Oak fence should not be selected if the material is at hand. The simplest form in which Oak can be so used is either in the shape of a trellis, for which small saplings or logs can be cleft or sawn through the centre—or as a post and rail fence with vertical posts set in the ground, and the clearest and best lengths cleft in about 9 feet lengths for the horizontal rails. A further use, and one which requires still better stuff and more skill in preparing and erecting, is the close park fence, with Oak posts and angle rails; to which the cleft pales are nailed. Between these types there are numberless variations, upon which there is no particular need to dwell now, as these remarks are rather suggestive than of a precise and technical character. Besides fences made wholly of wood, there are many in which wood and iron are combined. These, however, as a rule, have not the best effect, and are not the most durable, as the wires attached to wooden posts generally become loose and untidy. In cutting scantlings, or in squaring up large posts, there is always a quantity of rough off-cuts, or slabs, with one side only sawn. This, again, is a most useful material for fences which have to stand the thrust of cattle, as, properly secured to stout rails it can be made very rigid. In fact, now that small Oak especially is at such a discount, it is an open question whether occasionally it would not pay to cut up round pieces on purpose for this class of slabbing, *i.e.*, to get one or two planks from the centre of the pieces, and throw off the outsides in the way described. Field gates, again, can be more economically made of Oak than of any other material, even if the wood has to be purchased, but when it grows upon the place, and the right kind of tree can be selected, the advantage is all the greater. It would be easy to multiply instances in which Oak at its present low value should be used instead of buying other material, but the few hints given above will be enough to indicate the general lines upon which those who have the handling of the timber and of the estate work as well, would do well to look closely into the comparative suitability, durability, and cost of wood, iron, stone, or brick, for the wide range of work which invariably falls to their lot. The adoption of Oak would do good in two ways, as it would make durable work, and also help to absorb the surplus which has some way or other found its way into the market and forced prices down. *D. J. Izo.*

HOME CORRESPONDENCE.

ROYAL HORTICULTURAL SOCIETY'S EXTRA COMMITTEES.—The existence of a committee in connection with the Royal Horticultural Society which applies its energies solely to the consideration of Narcissi, is, when properly regarded, a somewhat anomalous matter, because its existence either assumes that the ordinary Floral Committee, in spite of its numbers and representative character, is yet incapable of dealing with Narcissi, or else that this family of spring flowers merits much more than ordinary attention. It may be that this special body is riding Narcissi to death. It may be that in its action it is performing valuable service to one section of horticulture. Critics little gifted with the true faith assert the former; I prefer to hold to the latter, because I do not wish to see anything associated with horticulture made the subject of ridicule and contempt. No doubt this Narcissus Committee, although given to much refining, which vulgar minds find it hard to follow, yet find abundant work in the wondrously prolific characters of the Narcissi and their varied forms. Perhaps an end may be reached some day, but the faithful hold such consumption to be remote. Narcissi, in addition to being so abundant, are exceedingly varied, and in spite of their being served up through the spring almost *ad nauseam*, are yet admittedly exceedingly beautiful. Then they are all very hardy, and will grow in almost any garden soil, although more or less well according to culti-

vation. These things allied to a fairly long season certainly tell immensely in favour of the Daffodil, and appreciably justifies the existence of the Narcissus Committee. But still there does remain the question, Why a special committee for Narcissi only?—why not one specially for Orchids, or Roses, or Dahlias, or Chrysanthemums, or even for Apples or Potatoes? Granted the necessity in one case and the existence of such extra committee, it is hard to refuse in another; and after all it becomes a matter worthy of consideration whether it would not be good policy on the part of the Society to call more of these committees into existence. Were that done, instead of limiting the interest in the actual supervision of flowers, bulbs, &c., to the ordinary committees each extra committee would evoke the enthusiasm of many outside the present select circle, and the active committee range might be quadrupled, thus bringing in many who are still outside the Society's ranks. Of what matter would it be were there a score of these extra committees sitting at varying periods through the year, if all were under the authority of the Council, and all doing good horticultural work. Either the Narcissus Committee is a useful body, or it is a sham. If the latter, it stands condemned; if the former, then it proves up to the hilt that equally good work can be done by other special committees in numerous directions. Some will aver that sheer impudence on the part of the Daffodil men provoked the appointment of the committee; but without assenting to that opinion I will at least say that impudence, if you like to call it so—although I prefer the terms boldness and enthusiasm, are the elements to achieve aims and to promote success. I shall therefore be bold enough to suggest that similar sub-extra committees be formed by the Society for any specialty which calls forth peculiar interest, or evokes active interest. Why, for instance, should not Trees, Roses, and Orchids have special committees? Why should the Royal Horticultural Society so languidly hand the Queen of Flowers over absolutely to the mercies of the National Rose Society? Then if we consider the numerous variety and beauty of the Chrysanthemum, do we not find a field open to a special committee to which Narcissi offer in comparison but an acre to a square mile? In vegetables, sub-committees might be profitably employed in dealing with Peas and with Potatoes some of the most popular of vegetables. Until really set about in a studious and practical fashion it is impossible for any one to tell how much room for work may be found in the directions indicated. If the Council would agree to form these special committees let them fix their numbers at, say, twelve members, four of whom should belong to the Floral or Fruit Committee, as the case may be, while the other eight might be obtained from outsiders who have good reputations in connection with the flowers or vegetables named. Give these committees a fairly free hand, except in the expenditure of money, let their proceedings be made as public as possible, and they will create a public interest in horticulture, of which the regular committees, as they exist, are incapable. If the Royal Horticultural Society is to become a real factor in horticulture it must get away from its old-fashioned rut of action, and thoroughly adapt itself to the needs and variations of the age. *Spade.* [The formation of numerous special societies shows that the Royal Horticultural Society hitherto neglected its work. There should be no room for special Societies if the parent society did its work properly. Ed.]

MEETING DAY OF THE ROYAL HORTICULTURAL SOCIETY.—Cannot the Royal Horticultural Society's fortnightly meetings be so arranged as to fall on any other day but Tuesday? I think it would be found that many country gardeners at a distance, who are unable to send in any other way than by parcel post, would be only too pleased to have the opportunity to send their oft-times meritorious examples of flowers, fruits, &c., to place before the different committees. As at present arranged, unless they send on Saturday they are not always delivered in time; and of course flowers, &c., are quite spoilt by that time. In many outlying country places there is but one post, and that, as a rule, late in the evening, consequently any parcel posted on Monday evening could not be delivered until the afternoon of Tuesday—also too late. The Society having now, as it were, started on a new life, would it not be to their advantage to do anything likely to gain the good-will and ultimate help of gardeners at a distance less fortunately placed in this respect than their brother gardeners nearer London? *J. W. K., Blackmoor.*

WANTED, A GARDENER.—The above at the head of last week's "Want Places" appears most ironical. The number of situations were six, "not including the woman," whilst the advertisers for situations numbered upwards of a hundred. How many of these unfortunates would receive an answer to their advertisements? And still apprentices and improvers come crowding on, and head gardeners are aiding and abetting them. Perhaps the latter see in the dim distance a brighter future than is at present apparent to many of the despondent ones, whose advertisements are to be seen week after week in the *Gardeners' Chronicle* applying for situations; if so, it would be an act of charity to make known in what direction it is to be looked for. Is it in any of the Colonies? If so, would it not be wiser rather to expend the money, offered here in premiums, to pay the passage out? Or is it at home, after all, where these volunteers will get active service? It will readily be admitted that at present it is impossible for a large proportion of the applicants to reach the goal they have in view, *i.e.*, the management of a garden themselves some day; nor will the emigration of a great number of gardeners be any loss to the profession. At the same time it is much to be feared that the Darwinian theory of the "survival of the fittest" does not always work out satisfactorily. Could not the Royal Horticultural Society make it practicable to issue certificates of efficiency in the several grades of gardening on examination, say, similar to those of the Science and Art Department? It would be the means of weeding out numbers who now crowd the profession needlessly, and therefore make it all the better for gardening and gardeners. *Querist*. [We hope and believe that this subject will speedily receive the attention of the Council. Ed.]

PRIORITY IN NOMENCLATURE.—In your report of the Crystal Palace Show we are sorry to notice your representative omitted to observe that, although we had renamed the new quilled Cineraria, "Emperor Frederick," we attached below the name under which it was certificated (Alexander Warwick) last year, at the time we purchased the entire stock. As your report at present reads in a manner liable to cause some misapprehension, we shall be glad if you will state that we purchased the entire stock under the name of "Alexander Warwick," and have since decided to give it a popular and well-known name, instead of retaining one that has no significance. *James Carter & Co.* [Messrs. Carter do but confirm the accuracy of our reporter's statement, which indeed was apparent from the labels. We think Messrs. Carter's practice of renaming a plant already certificated, is open to serious objection. Ed.]

EXCEPTIONS TEST THE RULE.—Under the above heading there appeared in the *Gardeners' Chronicle* of Feb. 25, an article and figure (40) of an *Odontoglossum Pescatorei*, producing its flower spikes from the top of the pseudobulb, instead of from the side as usual. When looking through Mr. W. Gillett's collection at Oak Lodge, Bishopstoke, a few days ago, I saw the same occurrence on a plant of *Lycaste Skinneri*; and now I have just observed one of our *Odontoglossum Alexandræ* which has a spike with six buds on the top of the pseudobulb, and another showing from the side. I have never seen similar abnormal growths before, except in the case of *Calanthe Veitchii*, a plant that does so with us. *N. Blandford, Moor Hill, West End, Southampton.*

CARNATION BUDS GOING BLIND.—This malady is the result of bad management, intensified, perhaps, by the cold, dull weather. If "G. G." had removed the adventitious growths on the stem, the flower-buds might then have developed. Some varieties of the Carnation have a tendency to develop side-growths, but all are liable to it, especially at mid-winter. The probable causes are badly ventilated structures, too great distance from the roof-glass, over-rich soil, and too much water at the roots. It is difficult to obtain good Carnation blooms from some varieties at the most sunless portion of the year, and they should at all times be grown in places well lighted and ventilated, in which the atmosphere is moderately dry, and the plants so near the glass that the flower-buds may be within a foot of it. Another item of importance is the state of the roots; the pots ought to be well-filled with them, and no water should be supplied to the plants unless they really need it. It is a fact that re-potting the plants late in the autumn, when they have not time to root into the new compost before the winter, will cause the flower-buds to become blind, with the

certain result that side-growths will be produced. *J. Douglas.*

NARCISSUS MINOR.—The enclosed Daffodil grows wild here, and in considerable quantities. I see a Narcissus in some catalogues as *minor nanus*, is it that? Also, can you tell me how the bulbs increase and run? Sometimes a clump will put out offshoots a yard off without any apparent connection. Often I can trace the cause to rabbits, and often to birds pulling the bulbs up and dropping them again. I can trace them on banks where the rain has washed bulbs down and they have stuck, and taken root, and forced in time fresh clumps. But very often their spreading puzzles me. They are in great abundance here, and come up frequently in gravel walks and paths. *E. W. W.* [If this plant (*N. minor*) is so very abundant its bulbs may often get removed to considerable distances in the garden by various agencies, especially by the lawn and walk sweepers. A bulb may get trodden unperceived to the surface of a walk, to reappear, it may be, next season as a flowering plant. No offsets, unless detached from the parent, would appear at a distance of 1 yard from the latter. Ed.]

LOAM FOR RHODODENDRONS.—I hope that readers of the *Gardeners' Chronicle* will not be induced by your correspondent, "W. G." (p. 403), to attempt the growth of the better kinds of Rhododendrons without some peat, as loam will not answer in all localities. About five years ago I was persuaded by a local nurseryman to plant a small border in my garden with Rhododendrons, making the bed of turfy loam and cow manure well rotted together. The plants were obtained for use from a well-known nursery, and were as fine looking a lot of young plants as any one could wish to see. They flowered profusely the first year, but after flowering many of them dwindled away instead of making healthy growth; and by twos and threes each year the whole, with the exception of about three, which are now as miserable looking as possible, have by this time disappeared. My neighbour seeing my first year's display, imitated my example with even more disastrous results. Those which I took up dead, had not in any case sent out roots into the prepared soil, living wholly in the ball of suitable soil which originally accompanied them. That the locality is not to blame (for we have no chalk within forty miles) is proved by a friend who lives within six minutes walk, who grows his Rhododendrons to perfection, but he has a friend the owner of several acres of peat-land, who has supplied him with truckloads of peat to make his beds. I may also add that in this neighbourhood, where the ground is naturally sandy, and has been enriched with manure and leaf-mould, the forms of *R. ponticum* do very well. *S. Cumming, Rugby, March 31.* [We know by ample experience that Rhododendrons will do perfectly well in sandy loam without peat. Ed.]

STOPPING VINE SHOOTS AT MANÈGE, BELGIUM.—I have noted at p. 333, your short extract from the *Bulletin d'Arboriculture*, relative to some experiments in stopping vine shoots at Manège, in Belgium, and expressing the hope that some one would try the experiment here. Indirectly, I have no doubt this is very frequently done. The first point to consider is this, why do we stop the Vine shoots at all? The common practice is to do so at the second leaf beyond the bunch, and the reason is, not that we expect to improve the bunch of fruit by doing so, but purely for the economy of space, and to prevent confusion and crowding of the shoots. Good cultivators know the value of leaving the shoots longer than the general limit, because the more leaves fully developed the better, but the longer they are left the wider apart must the Vines be, and the fewer the bunches—and the less the crop. That the bunches on the unchecked shoots should be as good as those on the stopped shoots goes without saying, but that the fruit should ripen "three weeks in advance," requires a lot of believing—why this is better than many tons of coal! *A. F. B.* [We concur, and at the same time are glad to have a sensible reason assigned for stopping. En.]

CHRYSANTHEMUMS.—I fear Mr. J. Murphy has misunderstood, or not read carefully, that which I wrote at p. 303, for in taking exception to the paragraph in question he writes, "I propagate most of my plants in boxes from cuttings;" and further, "I never think of planting whole potfuls together," &c. Exactly so; neither do I think of planting out whole potfuls together, and have not advocated such

an absurd practice. If your correspondent will kindly refer he will find it stated that the plants should be of "the previous year's growth in pots," and that I also write, "turn out the whole stools, and reduce the balls to one-third of their bulk." Surely from this he would not infer that potfuls of rooted cuttings were intended to be planted out. *J. Horsefield, Heytesbury.*

THE PROSPECTS OF A FRUIT CROP.—It is rather soon to begin bemoaning a small Pear crop this season, but on looking round my garden I can see but very little prospect of even an average crop. My trees are scarcely showing any fruit-buds at all, although in the last season, and, indeed, for some years past, we have had an abundant show of flower; but this year only half the number of my trees are showing any at all. I attribute this state of things to the cold winds of last year, which tore off the tender foliage and young fruit alike, leaving the trees as though scorched. The consequence was that the growth was checked, and did not recommence for some time, and did not get properly ripened, and to this cause may be due the scarcity of bloom. *Pomona.*

MIXTURE FOR MILDEW.—I can add my testimony to that of "R. D.," p. 404, as to the efficacy of the mixture he recommends for destroying mildew. We made a quantity two years since in the way he describes, but although it destroyed the mildew and left no sediment on the plants, it caused a lot of dark brown spots on the paint wherever it touched it, which had a bad look, and it was almost impossible to wash them off. The mixture resembles sulphide of potassium in appearance when ready for use, and is quite as effectual; is very much cheaper, and has not the objectionable smell of that substance. As a "cure" for mildew I prefer sulphur on the pipes to any of the various remedies I have tried; but would not advise any one to use it for Vines before the berries are stoned, unless put on and well heated several times soon after the Vines are first started, in which case most of the strength would be exhausted before the Vines are in flower; but of course a great deal depends upon the temperature at which the pipes are usually kept. Prevention of mildew is, however, always far better than a cure. The note by the Editor is well timed, for I once remember seeing a viney, when calling on a friend, in which the crop was completely spoiled through syringing with Fir-tree oil when the Grapes were the size of Peas—the skin of the berries hardened and prevented their swelling. *W. H. Divers, Ketton Hall, Stamford.*

HARDINESS OF EUCALYPTUS COCCIFERA.—You have been good enough on one or two occasions to insert in the *Gardeners' Chronicle* some remarks of mine relative to the hardiness of *Eucalyptus coccifera*. About three, or perhaps nearly four years ago, I had planted in the garden of the Atkinson Morley Hospital at Wimbledon, four small plants of this *Eucalyptus*; one perished from drought, but the other three, notwithstanding the exceptional severity of the late three winters, have withstood snow and frosts remarkably well. They are now from 8 to 12 feet high, in an exposed site, and look (I saw them this day, March 27), in perfect health and vigour. Of all the tribe, *E. coccifera* is the one which will best bear our winters out-of-doors. It is quite a mistake to plant *E. globulus* for such a purpose. It might grow, in fact I have seen it grow, in the open air in winter in Cornwall, and in a secluded sheltered spot in Dorsetshire and Hastings Old Town; whereas the *E. coccifera* will flourish in any season, and its culture should be encouraged and promoted by all means. *John Colebrook.*

STATE AID FOR HORTICULTURE.—In your well-timed leader on February 25, in reference to the proposed Board of Agriculture, you remark that "It is very important at the present juncture that horticulture should be recognised in the constitution of this new Department, for it is obvious that while agricultural methods are no longer adequate to meet the circumstances of the times, the requirements of the case would be very largely met by the introduction of horticulture, or of horticultural methods." To refer to a few instances where State aid in horticultural matters would be invaluable. As is well known, the Royal Horticultural Society has in the past conducted a series of valuable trials in flowers, fruits, and vegetables in their experimental garden at Chiswick. How important it is to the community that such trials should

be exhaustive, and that a knowledge of their results should be widely and quickly diffused. Hitherto a sorely crippled exchequer has prevented this. When fruit culture is beginning to form an important industry in this country, it is necessary that cultivators should be made thoroughly acquainted with all matters concerning stocks for working fruit trees on, the best varieties to plant for quick returns, the influence of soils, aspects, and other practical details in connection with this subject. Then as to vegetables, to instance only one—the Potato—two-thirds of the varieties at present in cultivation should be discarded. If there are any "disease-proof" varieties let it be known which they are, or which are those that partially resist disease. Many of the exhibition sorts want exterminating, and the public

matters the importance of the subject must be at the earliest possible moment urged and brought before Parliament by our representatives. There would seem to be a capital opening just now to do this. Sir Trevor Lawrence, the President of the Royal Horticultural Society, is a Member of the House of Commons. He would, if requested, doubtless use his influence in this matter, and would, we venture to say, be supported by other admirers of horticulture. Reading recently an American work written some years ago on the propriety of the State Legislature exercising a fostering care over the interests of agriculture, I came across some remarks which seem to be quite worthy of reproduction here, such a bearing have they on the matter under present consideration. Sub-

science should be amply tested, and carried out before submitting them to the public. The most competent men at home and abroad should be invited to fill its professional chairs, and if money would tempt a Liebig, a Boussingault, a Johnston, or a Playfair, to leave the investigations of European soils and products, and devote all their mind and energies to the development of American husbandry, it should be freely given. These institutions should be schools for the teachers equally with the taught, and their liberally appointed laboratories and collections should contain every available means for the discovery of what is yet hidden, as well as for the further development of what is already partially known. Minor institutions should, of course, be established at different and remote points, to scatter the elements of agricultural knowledge throughout the land, and bring them within reach of the lowest citizens and the humblest capacities." A.

FIG. 62.—HERACLEUM GIGANTEUM.

look to some impartial, disinterested body to perform this much needed work. We are sadly in want of horticultural schools, in which respect we are much behind continental nations. While they do everything that is needed in these matters (with assistance from their various Governments) we practically do nothing. There would seem to be a large field here for the representative society to exercise its energies upon, provided it were assisted by the State. Supposing that such schools in this country were State aided, much needful work, by way of illustration, could be performed in the one department—the "Chemistry of Horticulture." Much of the knowledge possessed by gardeners about the application of manures is empirical, yet how markedly the matter bears on every-day work, and the help of true science in this field would prove an efficient helpmate indeed. If we are to make way in these

stitute gardeners for farmers, and horticulture for agriculture, and the case on our side is complete. The author remarks:—"Education in all its branches is under their (the State's) exclusive control, and to endow and foster every institution which has a tendency to raise and improve the intellectual, the moral, and the social condition of the people, has ever been their cherished policy; yet, up to this time, no institution expressly designed for the professional education of farmers has ever been established in this country. . . . In addition to continuing and making more general and comprehensive the encouragement for other objects heretofore considered, it is the duty of each of the larger States of the Union, liberally to endow and organise an agricultural college, and insure its successful operation within its jurisdiction. Connected with them, should be experimental farms, where the suggestions of

WINTER TREATMENT OF ALLAMANDAS.—The winter treatment of Allamandas seems to have given rise to much difference of opinion. Some correspondents consider the drying-off system inimical to the well-being of the plant, whilst other cultivators regard the process as beneficial. Experience teaches me this particular plant should have a thorough rest for three months at least. Three years ago I planted out a plant of *A. Hendersoni* from a 32-sized pot. The accommodation was very limited. A small recess, about 18 inches square, was built of bricks enclosed on two sides with hot-water pipes. This of course demanded that a greater amount of water should be afforded to the soil than it otherwise would have required. The soil was composed of two parts fibre loam and one of peat, with a little coarse sand added, and plenty of drainage. The first season the growth was rapid but the blooms were few. About the middle of October water was gradually withheld, and the second week in November the plant was pruned back like a Vine. It was allowed to remain in this condition until the first week in February, when tepid water was again applied; it soon started freely into growth, and bloomed abundantly up till the end of October, when the treatment above stated was repeated. Noticing last spring the strong and rapid growth it was making, I determined to keep a correct record of the numbers of blooms cut through the season; this was rather a tedious undertaking, but from the first week in May till the end of October there were gathered no less than 6280 blooms, many of them measuring six inches across, and I have counted 900 blooms fully expanded at one time. Before pruning it covered a space on the roof 27 feet by 7, and even on the same day as it was pruned 200 good blooms were taken off it. Owing to the density of the foliage early pruning was necessary, so as to give light to plants growing underneath. This season it started into growth much earlier, and opened its first bloom on Good Friday. The treatment above described seems to prove that a thorough rest in winter and close pruning are essential to ensure success the following season. J. G.

HERACLEUM GIGANTEUM.

SOME gardeners go to great expense and trouble in housing "sub-tropicals" which, after all, generally have a foreign look, and do not look "at home" in the places where they are generally placed. To come upon them in the dell or the wild garden is to receive a shock of inappropriateness. It is so obvious that they are strangers and that their disposition is incongruous and artificial. Their place is in dressed gardens and localities obviously made by Art and not in wild or quasi-wild spots. For such localities a hard hardy perennial or biennial, such as *Heracleum giganteum* (fig. 62) is more suitable. There are few, if any plants, more noble in appearance than this gigantic Umbellifer. Its rapid growth and stately appearance always excite attention. It seeds so freely that care must be taken not to allow it to spread too much. A rich deep loamy soil suits it best, but it is not very particular. It is not suitable for the dressed garden or near to the house, as its perfume is coarse, and to most people objectionable. One of the earliest of the many services rendered to horticulture by the late Mr. Thomas Moore was the introduction of these hardy Umbellifers as decorative plants.

SOCIETIES.

LIVERPOOL HORTICULTURAL ASSOCIATION.

MARCH 28.—Plants were shown in considerable numbers, and in some cases the competition was remarkably close. For six stove and greenhouse plants, three foliage and three flowering, F. H. Gossage, Esq. (gr. Mr. J. Jellicoe), had the premier collection which included a grand *Pritchardia pacifica* and *Lantana borbonica*, each about 10 feet through; *Croton Queen Victoria*, *Rhododendron fragrantissimum*, a splendid plant; a large bush of white *Azalea*, and and *Chorozema Lawrencianum*. For a table of miscellaneous plants arranged for effect W. H. Watts, Esq. (gr. Mr. A. R. Cox), was first with his usual light artistic arrangement consisting of a groundwork of *Adiantum cuneatum*, with *Crotons*, *Palms*, &c., rising at intervals, the whole being enlivened with bulbous and other flowering plants. Mr. Jellicoe was a good second, having a more massive arrangement containing a larger and more varied selection of flowering plants.

For six *Azaleas* Mr. Jellicoe took the lead with fair sized specimens, fresh and well-flowered, the most meritorious being Feilder's White, Charles Van Bek-haute, and roseum; H. Cunningham, Esq. (gr. Mr. Wilson), was 2nd with a fine lot, but a size smaller.

For three distinct varieties J. R. Dixon, Esq., was 1st.

For a single stove plant in flower Mr. J. Harrison was 1st, with a splendid plant of *Peristeria elata* with seventeen spikes.

For four exotic Ferns J. Gowan, Esq. staged the leading collection, which included a magnificent *Goniophlebium sub-ariculatum* well furnished with fronds from 6 to 8 feet in length.

Mr. J. Jellicoe was 1st, for a single Tree Fern, with a good specimen of *Dicksonia antarctica*.

For four hardy *Rhododendrons* Mr. W. Bustard was 1st, with large well-flowered plants.

For one greenhouse variety Mr. A. R. Cox was 1st with a magnificent plant of *R. Gibsoni* var. *superba* over 4 feet in diameter.

For six forced hardy plants, A. Crosbie was 1st, his collection containing *Clematis Hon. D. Neville*, *Azalea amara*, and a nice *Deutzia gracilis*, &c. The same exhibitor led for three *Palms*, or *Cycads*, with *Cocos Weddelliana*, *Kentia Fosteriana*, and *Lantana borbonica*. For a single specimen, Mr. J. Jellicoe staged a grand plant of *Dion edule*, with some fifty fronds upwards of 4 feet in length. For six *Cinerarias*, Mr. J. Stevenson was 1st; whilst of a like number of *Primulas*, Mr. A. R. Cox had the best.

Orchids were in fair numbers, and of good quality, the best four coming from H. Tate, Esq. (gr. Mr. J. Edwards), who staged an *Odontoglossum radiatum* with four spikes and thirty-seven flowers; *Cypripedium villosum*, with about four flowers; *Maxillaria Harrisonii*, with twenty flowers; and *Cattleya Mendelii*. R. Young, Esq. (gr. Mr. T. Poynter), was 2nd, with fine specimens of *Dendrobium nobile*, *Wallichianum* and *crassinode*. The best single plant was staged by Mr. J. Jellicoe, who had *Dendrobium Jamesianum*.

BULBS.

These in some cases were hardly of the high order of merit usually seen here. Hyacinths were not so numerous, and the spikes hardly so massive as usual. Narcissi were not represented largely, the border section not being recognised in the schedule, which is surely an oversight. Cyclamen were keenly contested, a splendid bank being staged, the individual crowns in many cases carrying from 100 to 200 flowers of splendid colour, substance, and size. The Lily of the Valley brought out another strong competition, ten lots being staged, all of marked excellence, carrying fine spikes and good foliage.

For eighteen Hyacinths, distinct varieties, Mrs. J. Aiken (gr. Mr. C. Waring) was 1st; Mr. J. Kelly was a good 2nd.

Miscellaneous.—This section seems to increase in extent. Some capital stands were arranged. Messrs. T. Davies & Co. showed a fine basket of Mushrooms, and T. Winkworth a collection of cut flowers of *Hellebores*. R. C. Naylor, Esq., had a collection of Apples in good condition, and Messrs. Fishlock Bros. showed mosses, bouquets, sprays, &c. Messrs.

R. P. Ker & Sons sent a collection of *Azalea indica*, *A. mollis*, &c.; and Messrs. J. Dickson & Sons a good selection of Narcissus and Hepaticas. The Liverpool Horticultural Company staged a table of miscellaneous plants, Mrs. Vesty a collection of skeleton leaves, and Messrs. Joseph Braham, Arthur Huxley, W. Wood & Son, J. & F. Mee, and Bethel horticultural requisites.

ROYAL CALEDONIAN HORTICULTURAL.

BULBS, &c.—The spring show was held in the Waverley Market, Edinburgh, on the 4th and 5th inst. Notwithstanding the long period of cold dark wintry weather that has prevailed, the entries were quite up to the average in number, and the exhibits equal to anything usually seen at these attractive shows. Spring and forced flowers were the principal features. Hyacinths were on the whole good, though generally there were noticeable, elongated flower scapes and flaccid foliage, owing to absence of light and natural heat which had necessitated the use of more artificial aid in pushing the plants forward than was desirable. Still in the several classes, viz., amateur, professional, and nurserymen, the leading lots were very meritorious indeed. Messrs. Laird & Sons took the first position for twenty-four, not less than twelve varieties distinct, with a very superior lot; and Messrs. Alex. Kerr & Son, Kalefoot, Roxburgh, were a close second with a well-balanced and distinct collection.

Tulips and Narcissi were a more than usually extensive show, and, on the whole, good. By far the larger number of the latter were of the Polyanthus section, but such of the Daffodil and incomparabilis types as were represented appeared to have a larger share of the admiration of the public than the first named.

Roses.—These were a very remarkable feature of the show, being larger in number and better in quality than they are usually seen at Edinburgh spring shows. The 1st prize lot of six, put up by Mr. John Paterson, Mill Bank, Edinburgh, were remarkably good, large well grown specimens and well flowered. The 2nd prize lot, from Mr. James Reid, Canaan House, were also capital plants, but not up to specimen size.

Cut flowers of Roses were also well represented, particularly *Maréchal Niel* and *Gloire de Dijon*, the former being very fine considering the date and the cold sunless period under which they have been produced. Mr. L. Walker, Linlithgow, took 1st prize for twenty-four cut Roses, not less than eight varieties, and Mr. W. Parlane was a good 2nd. Mr. Walker was again 1st with twelve *Gloire de Dijon*, which were very fine; Mr. J. Pearson, Beachwood, being 2nd in this class, with also very fine blooms. In the nurseryman's class for cut Roses Mr. J. Bryson, Helensburgh, took the 1st prize both for twelve in not less than six varieties, and for twelve *Maréchal Neil*, the latter being very fine indeed.

In the competition for nurserymen's tables of plants there was only one entry—Messrs. Laird & Son's, whose exhibit was a most attractive one, consisting largely of *Azalea indica* in variety, *A. mollis*, forced *Lilacs*, *Narcissi*, *Hyacinths*, *Cyclamens*, &c., intermixed with *Palms*, *Crotons*, *Aralias* and other foliage plants, and Ferns, in very tasteful combination.

Vegetables were well represented as regards quality, though the number of competitors, no doubt owing to the severity of the winter, was fewer than ordinary at this season's show. In the collections of twelve kinds Mr. Gideon Potter, North Berwick, was a very good 1st, but was closely pressed by Mr. Robertson of Hartrigg, Tedburn.

Mr. Thomas Milne, Sunny Bank, Edinburgh, was an easy 1st with twelve distinct sorts of salad stuff; and Mr. Davidson, Trinity, Edinburgh, staged a very meritorious collection which took 2nd prize. Mushrooms were well shown by Mr. J. Gordon, Liberton, and Mr. McLennan, Restalrig House, Edinburgh, who took honours in the order named. French Beans were set up by several competitors, Mr. J. Gordon being placed 1st, and Mr. J. McIntyre, Darlington, 2nd. The heaviest Rhubarb came from Mr. Thomson, Ferry Road, Edinburgh; the best twelve early Potatoes from Mr. Bigham, Edgerston House, Jedburgh; the 1st prize Broccoli, from Mr. T. Milne; the twelve largest Onions from Mr. T. Hogg, Cathcart; the biggest Leeks from Mr. G. Potter—and they were perhaps the biggest Leeks ever seen at these shows, which is saying a good deal: they were 7½ inches in circumference and about 18 inches blanched.

The various classes of plants were represented in about the usual number of entries and quality. Orchids were well put up by Mr. Curror, of Dalkeith, and Mr. Grossart, Oswald Road, Edinburgh, the former staging a very fine *Dendrobium chrysanthum*, *D. devonianum*, and *D. nobile*; *Cattleya Triane*, a very deeply-coloured variety, with large blooms, &c., took 1st prize in the class of six distinct; and the latter's collection, if less showy, was very attractive, and composed of well-grown plants of *Cymbidium Lowii*, *Dendrobium thyrsiflorum*, &c.

Stove and Greenhouse Plants.—*Azaleas* were well represented in the collections staged by John Paterson, Millbank, who took 1st honours in the class of four plants; and by Mr. Bald, who took 2nd prize in the same class.

In stove and greenhouse plants, six distinct, the last-named exhibitors stood in the same relative positions as regards prizes, and also in the competition for Cape Heaths. The class for four plants in flower, distinct, brought Mr. Grossart and Mr. Wilkins, Cannonhills House, to the front in their order.

Miscellaneous.—Ferns were well represented, especially filmy species and varieties, the best of the latter class coming from Mr. P. N. Fraser, Rockville, Murrayfield; and the 2nd best from Mr. Anderson, Model Buildings, Pilrig Park.

Space will only further admit of noting that fruit, in the shape of Apples, was well represented, the best twenty-four kitchen kinds being staged by Mr. McKelvie, Broxmouth, Dunbar, who also put up the best twenty-four dessert sorts. Pears came in fair condition from Mr. Brunton, Drem; and from Mr. Robertson.

In black Grapes there were only two competitors—Mr. Smith, Oxenford, and Mr. McKinnon, Melville Castle.

Of special exhibits there were several that were notable. Messrs. Ireland & Thomson had a magnificent bank of *Conifers*, *Clematis*, standard and dwarf *Azalea mollis*, and Ghent varieties, *Cytisus precox*, *Lilacs*, and other forced flowering shrubs, at one end of the market, to which the committee, on the suggestion of the judges, gave a special award. The same firm had also a beautiful table of flowering and foliage plants near by, comprising some very excellent varieties of *Odontoglossum Alexandræ*, *A. Pescatorei*, *Dendrobium devonianum*, and others. The Lawson Seed and Nursery Company set up a very full collection of Japanese *Acers*, which formed an interesting feature to the general public and to gardeners. Messrs. James Dickson & Sons had a very neat table of plants of the usual type of nursery, greenhouse, and stove stock. Messrs. Methven & Sons set up a large table of handsome flowering and foliage plants, and Mr. Robertson Munro had one of the best exhibits of spring flowers and alpine plants ever exhibited at these shows.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

MARCH 28.—The spring show under the auspices of this Society was held in the City Hall on the above date. Under ordinary circumstances amateurs contribute largely while full stately plants have been mainly furnished by the nurserymen in and around the city. Moreover the directors could, in emergency cases, always draw upon the Botanic Gardens under the now dissolved proprietary; but owing to the "thraw" between the suburban districts and the city proper, these fine gardens, with their wealth of plants, are a closed book to the public, and not one plant can be moved for any purpose. Hence the show, although a florid one, was conspicuous for want of some stately plants to fill the eye and give dignity to the groups. The weather, too, was of the most unpropitious character for many plants any distance from greenhouses to Hall—indeed, we have had no such month of March to contend with in that way from beginning to end of it since 1856.

Passing to the exhibits, Mr. Hogg, gr. to Mr. John Gordon, of Aitkenhead, had probably the most conspicuous individual plants, and taking foremost prizes in a great many classes. Among his best plants were *Rhododendron Countess of Haddington*, one of the best habited of the hybrid *Sikkim* class, full of bloom; also *Clivia miniata*, several good *Azaleas*, not the least worthy was *Louis de Kerchove*, *Duchesse de Nassau*; a well-bloomed *Coleogyne cristata*, an excellent *Cypripedium villosum*, and *C. insigne*, along with the showy *Dendrobium Wardianum*, and several others. Mr. George Wes-

ton, gr. to Mr. Cassewell, Murcia House, Pollok-shields, had the best table of plants, comprising some good Kentias and other Palms, several of the higher coloured Dracenas, a miscellaneous lot of Orchids, Anthuriums, nicely set round with Maiden-hair Ferns and grasses, and making a very effective whole. He was awarded the Gold Medal given by the Vice-President, Mr. John L. Henderson.

A very effective group of Orchids came from Mr. Kidd, gr. to R. B. White, Esq., Arddarroch, comprising fine pieces of Dendrobium Dalhousieanum, D. nobile, D. Wardianum, and others, along with *Ceoloyne cristata*, several *Oncidiums*, &c.

Mr. George Russell, gr. to J. B. Merrilies, Esq., Kelvinide, exhibited a good assortment of seedling Rhododendrons, mainly from Veitchii, ranging from pure white to flesh colour. Messrs. Austin & McAslan, Messrs. Smith & Junior, had showy tables of plants. Mr. Peter McKenzie, Paisley, had a superb assortment of bouquets. Mr. Bryson, Helensburgh, showed two or three boxes of superb bouquets of Marechal Niel Roses; and Messrs. Dobbie & Co., Rothesay, had a fair collection of Daffodils.

Hyacinths were generally good, the same varieties taking 1st rank year by year, indeed we did not notice anything in the same way of colour to beat Grandeur à Merveille, Mont Blanc, Von Schiller, and Macaulay.

Mr. P. Mackenzie had the best groups in the open classes followed by Mr. John Sutherland, Lenzie, Mr. Donald McBean (gr. to J. C. Cunningham of Craighs), Mr. Charles F. Carnegie, Garshore House; and Mr. George Irvine had the best groups in the amateur classes. Tulips were a fair show, the best coming from Mr. James Hern, Pollock House Gardens, who showed the best lots of Polyanthus and Narcissus. Mr. James Miller, Castlemilk Gardens, had a very good basket of spring rockery plants, a new feature introduced at the meeting.

The cottagers' class was only represented in generally good form Azaleas, Deutzias, Spiraeas by of which there was a large and an effective lot: Cyclamens, Cinerarias, Ferns, Lily of the Valley and all kinds of bulbs. The whole of the arrangements were as usual under the management of Mr. Franc Gibb Dougal, who was ably seconded by the members of the committee in carrying the project to a successful issue.

NOTICES TO CORRESPONDENTS.

APPLE: *A. M.* Good keeper and showy, but has little flavour.

AZALEA MOLLIS: *G. R.* The last season's growth was badly matured, or there is something wrong at the root. The plant makes early growth, and in some districts is spring-tender, which points to the need for some method of retarding growth or of protecting it when made. It dislikes hard forcing, so that only gentle pushing on is possible if good results are to be looked for, say, 45°—48° at night, with 10° rise during the day, with some ventilation. Plants that have been forced and those that have been hard pruned should complete their growth in, or at least be kept in a cool pit till there is no longer danger from frost. Unforced plants in pots may either make their growth in sunny pits or be shaken out of their pots and planted in a peat bed, taking care that they are not shaded by other plants, &c. For young plants peat and sand are sufficient, but strong plants may have a little finely sifted loam mixed with the coarsely divided peat.

BOTANIC GARDENS, ATHENS: *E. Fison.* Dr. Théod. de Heldreich is the director of the Garden. The list of gardens published in our issue for January 7 last, only includes gardens in the United Kingdom, the British Colonies, and India.

CARNATIONS GOING BLIND: *G. G.* See this week's issue, p. 436.

CHIONODONX WITH WHITE FLOWERS: *G. P.* Certainly very rare, but we have seen it on one or two occasions before.

CINERARIAS DYING OFF: *G. H. M.* Send soil and affected plant to this office for examination.

CUCUMBERS IN HOUSE: *G. N.* Stop the plants once when the main shoot has reached the trellis. You will then obtain four or five shoots, which should be allowed to reach the limits of the trellis without further stopping. Employ loamy soil, with one-quarter its bulk of decayed manure; it need not

be deeper in the hills than one foot. See our Calendarial directions from time to time.

CURRENT BED MITE: *L. H. G.* The buds are affected with this pest, which seems unusually prevalent in the North. It has been repeatedly figured in our columns. No remedy short of destroying the affected branches is of any use.

FOREST OFFICERS IN CANADA: *A. F.* These appointments are made locally. Apply to the Agent-General for the colony concerned, at his office in London.

FURZE: *J. M.* The quantity of seed required is 20 lb. to 24 lb. per acre, which may be sown either broadcast or in drills—the latter is the better way. If vegetation was abundant before the ploughing, and was turned under, then nothing may be needed beyond hoeing the ground during the summer; but should there have been but little growth on the land, some slight dressing of artificial manure may now be of use. Get the seed through any good seedsman.

INSECTS: *Furner.* The eggs of the Lacquey Moth, *Bombyx neustria* (see fig. 63). The caterpillars are very destructive to Oak, Elm, Beech, and Apple trees, &c. The moths are of variable colours, with rusty fox or ochrey markings. It is stated that the moths seldom fly, but hide in grass and under leaves during the day, and come out at night. Cut off the shoots with the rings of eggs, and burn them; also watch for the sulphur-coloured webs which the caterpillars spin, and follow the same course. The undergrowth of the orchards should be kept in good order, as it is in

FIG. 63.—THE LACQUEY MOTH.

this that the insects hide. The orchards should not be overcrowded, as if the trees are close birds cannot act so freely as insect destroyers.—*I. J. T.* The insects you have found on your young Vines are a species of Click-beetle (Elater hemorrhoidalis). In this state they do no injury to the Vines, but they deposit their eggs in the ground, and produce cylindrical scaly larvæ known under the name of Wireworms, which are injurious to plants, gnawing their roots and fibres. *I. O. W.*

GROWTH OF PLANTS: *J. H. G.* It is now established that the principal growth of plants takes place during darkness, while the preparation for it, as you say, is made in sunlight. Plants become drawn under glass because they are stimulated by the light, while there may be also a warmer temperature and more moisture there. The fullest modern account of the theory of plant growth suitable for practitioners is in Cassell's *Popular Gardening*, now in course of re-issue. See also *Plant Life* (Bradbury & Co.).

HERBACEOUS PLANTS: *G. B.* Yes, in the absence of any stipulation to the contrary, we should include bulbous plants such as die down in winter among herbaceous perennials.—*E. P.* The plants you name are all herbaceous plants. See previous answer.

KAMTSCHATKA BULB: *L. M.* The edible bulb stored like Onions by the natives of Kamtschatka, is that of *Fritillaria kamtschatkensis*, the *Sarana edulis* of some authors.

LATE CHRYSANTHEMUMS: *T. B.* The variety is well worthy of propagation as a late bloomer, and also for its colour, which is almost identical with that of Cullingfordi.

LILY OF THE VALLEY: *J. L. H. Dammann, Jun.,* Breslau, Germany.

LOW TEMPERATURES: *S. M.* In 1837-38 a temperature of -13.5 was recorded at Beckenham. In 1845 on February 12 at Isleworth -5°, and on December 25, 1830 -15° at Cheadle. In December, 1879, was the lowest temperature recorded for December of the century, viz., at Leaton -11°.9. About the middle of February 1881, the temperature at Kelso was -16°, shortly after this -10° was registered at Cardigan.

NAMES OF FRUIT: *W. B. K.* Wyken Pippin, in capital condition.—*J. S. H.* The specimen is not in character now; send next season when in good condition.

NAMES OF PLANTS: *Clonmel.* (Daffodils, no numbers). Flower all white, N. cernuus; flower with pale yellow segments, long yellow cup, N. princeps; flower with white segments, yellow crown, N. bicolor Horsfieldi, P. B.—*F. J.* 1, *Hepatica triloba*, double pink variety; 2, *H. triloba*, single blue.—*W. S. Bissett.* 1, *Cymbidium Hookerianum*; 2, *Ceoloyne elata*; 3, *Cymbidium aloefolium*.—*A. L.* *Lycaste plana*.—*Will Sorley.* *Ceoloyne flaccida*.—*John Waldie.* 1, *Odontoglossum luteo-purpureum*; 2, *O. Andersonianum*; a very pretty variety.—*A. B.* *Eriobotrya japonica*.—*E. H. C.* 1, *Cystanthe lutea*; 2, specimen insufficient.—*F. S.* *Trichopilia suavis*.—*Camjee.* *Deudrobium nobile*.—*W. Owen.* *Cypripedium hirsutissimum*; a fine bloom from a strong healthy plant.—*W. G.* A species of *Crotalaria* from Honolulu; we cannot determine which, as the specimen was not sufficient.

SANKEY AND SON'S GARDEN POTS.

From Messrs. MARSHALL BROS. AND CO., Barnham and Brighton, Agents for our Pots for Brighton and district.

"GENTLEMEN.—The last consignment of 16,000 pots to hand in very good condition. We like your pots very much; they are light, and very durable, and we save fully £50 per annum by using them instead of our local pots."

From Messrs. ARMITAGE AND SON, Nurserymen, Huddersfield.

"We have used for over twenty years, and are still using and selling, only Sankey's Nottingham-made Garden Pots."

"BULWELL POTTERIES," NOTTINGHAM.

Carriage and Breakage Free on £10 Orders. Half Carriage and Breakage Free on £5 Orders.

Samples (carriage free) gratis, prices free on application.

From Messrs. HARLEY AND SONS, Dundee and Perth, N.B. "We are very pleased with quality of your pots; we grow large quantities of plants for market, and find nice-looking pots make the plants look and sell better; yours are not only superior to others in colour and shape, but are not half the weight, yet stronger, neither do they turn green." From Messrs. WALSHAW AND SON, The Nurseries, Scarborough. "The pots are so superior over all others we have used that we shall have great pleasure in placing our orders exclusively with you."

USEFUL PRESENTS FROM IRELAND.

JENSEN'S

Every grain fertilizes because the Guano is perfectly pure. It is most economical, one part of Manure to 100 parts of soil being ample for garden use.

FISH-POTASH

FISH-POTASH contains Ammonia, Phosphates and Potash in large proportions, which are the principal elements of fertilization.

GUANO.

GUANO—2-lb. Tins, 1s.; in Bags, 7 lbs., 2s.; 14 lbs., 4s.; 28 lbs., 6s. 6d.; 56 lbs., 10s. 6d.; 1 cwt., 16s.; 2 cwt., 30s. Special terms for larger quantities. Analysis guaranteed.

J. JENSEN & CO. LIMITED.

109, Fenchurch Street, London, E.C.

To Gentlemen, Nurserymen, Builders and Others intending planting Shrubs and Trees, &c., this Autumn.

ROBERT NEAL begs respectfully to call attention to his large and varied stock of the above, more especially to those varieties most suitable for Town Planting, of which he holds a large collection, such as PLANES, LIMES, ELMs, CHESTNUTS, EUONYMUS, ACUBAS, and HOLLIES, and others too numerous to mention. Free delivery within a radius of 10 miles, on all Orders amounting to £5 and upwards. An inspection solicited. CATALOGUES free on application. The Nurseries, Trinity Road, Wandsworth Common, S.W.

- 100 CONIFERS, in 50 distinct varieties for 50s.
- 100 ORNAMENTAL TREES, in 50 distinct varieties, including many variegated golden and purple Acers, &c. for 50s.
- 100 DECIDUOUS SHRUBS, in 50 distinct varieties for 20s.
- 100 EVERGREEN SHRUBS, in 50 distinct varieties for 30s.
- 100 ROSES, in 50 finest varieties, of H.P. and Tea on the Seedling Brier, from the open field for 35s.

We may state that we have grown Teas on the Seedling Brier in the open field for many years back, proving that they are about as hardy as the H. P., as we have frequently had the latter cut back to the snow line. It is only when the thermometer registers below zero that they require protection.

- 100 HERBACEOUS PLANTS, in 50 fine varieties for 20s.
- 100 PRIMULAS, in 50 distinct varieties for 50s.

Catalogue of Names may be had free on application.

Or of all Seedsman and Seed Potato Dealers.

STANDEN'S
MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used **STANDEN'S MANURE** for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—**C. M. HOVEY, Boston, U.S.A., May 27, 1887.**"

Sold in **TINS**, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in **KEGS**, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsman in the United Kingdom and the Colonies.

 London Agent, Mr. H. SKELTON, Seedsman, &c., 2, Holloway Road, N.

The above sketches represent the newest and most effective form of Circulating Boiler for Heating Horticultural Houses, Churches, &c. This form of Boiler is particularly advantageous for shallow drainage. It has more direct heating surface than any other made heretofore of the same weight and depth. No skill is required in setting. The flue being continuous and undivided avoid all swirls or obstructions to the draft.
 For further particulars apply to Messrs. MARRIOTT AND GRAHAM, Plantation Boiler Works, Glasgow; or the Patentee, JAS. ANDERSON, 53, Woodstock Road, Belfast.

GARDENING APPOINTMENTS.

Mr. EDWIN JAS. SMITH, Foreman at Conishead Priory Gardens, Ulverston, Lancashire, has been appointed Head Gardener in place of Mr. J. GRANT.

Mr. SAMUEL NASH, late Foreman at the gardens, Alton Towers, has been appointed Gardener to W. SMITH, Esq., Spring Hill, near Accrington.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BALLIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 257 and 238, High Holborn, W.C.

WANTED, a GARDENER!!!—Having had long experience and an extensive connection we are in a position to RECOMMEND MEN thoroughly capable of filling with credit any situation in the Gardening World. On receipt of full particulars we will recommend a suitable Man. Correspondence invited.—R. B. LAIRD AND SONS, Successors to Downie & Laird, Seed Merchants, Edinburgh.

Gardeners, Ballifia, &c.

JOHN LAING AND SONS, having filled many important places, can RECOMMEND with every confidence, energetic and practical MEN of tested ability and first-rate character. Ladies and Gentlemen in want of Gardeners and Balliffs, or Gardeners for first-rate establishments, or Single-handed situations, can be suited, and have full particulars by applying to us. No fees charged.—JOHN LAING AND SONS, The Nurseries, Forest Hill, S.E.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SCOTCH GARDENERS.

—JOHN DOWIE (of the late firm of Downie & Laird), Seedman, 141, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engage-ments. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

GARDENER (HEAD); married, no family.—The Countess of SELKIRK wishes to recommend George Ormiston, her late Gardener, who lived at St. Mary's Isle nearly seven years, and left there only in consequence of the Earl of Selkirk's death. Reference, the Countess of Selkirk, 50, Berkeley Square, W.—Address, W. ORMISTON, 113, Harwood Road, Fulham, S.W.

GARDENER (HEAD); Age 42, married; thoroughly practical in all branches; ten and nine years in two last places. Excellent references.—H., 18, St. Wilfred's Place, Ripon.

See Next Page.

SEE PREVIOUS PAGE.

GARDENER (HEAD), and ORCHID GROWER.—A GENTLEMAN can confidently recommend his late Head Gardener. Thorough good Orchid Grower, and a well qualified man, with Ferns, Stove and Greenhouse Plants, and Chrysanthemums, Vines, Cucumbers, and Melons. Several years with the late John Day, Esq.—**GARDENER, 4, Essex Place, Railway Road, Teddington, S.W.**

GARDENER (HEAD), where two or three are kept; age 29, single.—**J. AMYS, Gardener to the Hon. Mrs. Elliot, York, Hamble Cliff, Southampton, can with confidence recommend his Foreman (G. Dovey) as above.**

GARDENER (HEAD).—Middle-aged; eighteen years' good character from last place (with titled Lady, near Richmond).—**B. A., 12, Hewwood Road, Gomm Road, Southwark Park, S.E.**

HANDYMAN, on Nursery or Estate.—Car-pentering, Painting, Glazing. Good experience and character.—J. N., 115, Flaxman Road, Loughborough Junction, S.E.

HOLLOWAY'S OINTMENT AND PILLS.—Diseases of the Bowels.—A remedy, which has been tested and proved in a thousand different ways, capable of eradicating poisonous fumes from ulcers, and healing them up, merits a trial of its capacity for extracting the internal corruptions from the bowels. On rubbing Holloway's Ointment repeatedly on the abdomen, a rash appears, and as it thickens the alvine subsides. Acting as a derivative, this Ointment draws to the surface, releases the tender intestines from all acrid matters, and prevents inflammation, dysentery, and piles, for which blistering was the old-fashioned, though successful treatment, now from its painfulness fallen into disuse, the discovery of this Ointment having proclaimed a remedy possessing equally derivative, yet perfectly painless, powers.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1888.

The Winners of every First Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS.

The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 140,000 of these Machines have been Sold since they were first introduced in the year 1856,

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—

- 1st Simplicity of Construction—every part being easily accessible.
- 2nd. They are worked with much greater ease than any other.
- 3rd. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

HORSE MACHINES.

To cut 30 inches	... £22 0 0
To cut 36 inches	... 26 0 0
To cut 42 inches	... 30 0 0
To cut 48 inches	... 34 0 0
Leather Boots for Horse	... 1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

Delivered Carriage Free at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders supplied the same day as they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

GARDEN SEATS and CHAIRS, AND HORTICULTURAL IMPLEMENTS OF EVERY DESCRIPTION, WIRE NETTING, &c., &c.

Descriptive Illustrated PRICE LISTS Free on application to

MESSRS. PROTHEROE and MORRIS will sell the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY and SATURDAY NEXT, April 18 and 21, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Friday Next.

ODONTOGLOSSUM ALEXANDRE.
CATTLEYA TRIANG.
CATTLEYA SANDERIANA.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. J. Charlesworth, of Bradford, to sell by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, April 20, at half-past 12 o'clock precisely, a fine importation of ODONTOGLOSSUM ALEXANDRE, containing plants of exceptional size collected from the best district and in very fine condition. Also for UNRESERVED SALE a large quantity of CATTLEYA TRIANG. from Ibagne, well-leaved with plump bulbs and dormant eyes. A small consignment of CATTLEYA SANDERIANA, with handsome bulbs. O. Linden leaves spikes from 2 to 3 feet long, and is an extremely pretty species.

On view morning of Sale, and Catalogues had.

Friday Next.

ESTABLISHED ORCHIDS and ODONTOGLOSSUM ROSSII MAJUS AUREUM.

MESSRS. PROTHEROE and MORRIS will include in their SALE by AUCTION of ORCHIDS on FRIDAY NEXT, April 20, about 70 lots of well-grown Established ORCHIDS, from a private collection, including Dendrobium Amstrongii, the best variety; D. noble nobiliss, true; Cypripedium Schroderi, C. Dominianum, Dendrochilum obovatum, and others.

Also about 100 plants of ODONTOGLOSSUM ROSSII MAJUS AUREUM, collected and brought home by Mr. Pechacek, including several large masses. Dried flowers will be shown at the time of Sale.

On view morning of Sale, and Catalogues had.

Penge, adjoining the Railway Station. L. B. and S. C. R. By order of the Mortgagee. With possession.

MESSRS. PROTHEROE and MORRIS are instructed to sell by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on FRIDAY NEXT, April 20, at 2 o'clock precisely, in one lot, the valuable FREEHOLD PROPERTY, known as the Vine Nursery, with the Glass Erections and Fittings standing thereon. The land has a frontage of 202 feet by an average depth of about 100 feet, and is ripe for immediate building operations.

Particulars, with plan, may be had at the Railway Tavern, adjoining the property; at the Mart; of Messrs. KINGSFORD, DORMAN and CO., Solicitors, 23, Essex Street, Strand, W.C.; and of the Auctioneers and Surveyors, 67 and 68, Cheapside, London, E.C., and Leytonstone.

Swanley, Kent.

About a mile from Swanley Junction Station, in the parish of Sutton-at-Hole. Important to Builders, Market Gardeners, Nurserymen, and Florists.

MESSRS. PROTHEROE and MORRIS are instructed to sell by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on FRIDAY NEXT, April 20, at 2 o'clock precisely, in two lots, a valuable block of FREEHOLD BUILDING LAND, situate at Hextable, near Swanley, having a frontage of 582 feet to the new existing road, and 40 feet to the main road, containing a total area of 9 a. 0 r. 17 p., situate opposite Hextable House. The land is particularly eligible for subdivision into building plots, but could also be profitably utilised for Market Garden or Nursery purposes, the soil being of such excellent quality. Also a choice block of FREEHOLD LAND, close to the preceding lot, with an extensive ffrontage, and containing an area of 12 a. 1 r. 22 p., partly stocked with orchard Fruit Trees and Bushes, for the growth of which it is adapted, but equally valuable to a nurseryman or florist.

Particulars, with plan, may be had of Mr. BONNY, Hextable, Swanley; at the Mart; of Messrs. KINGSFORD, DORMAN and CO., Solicitors, 23, Essex Street, Strand, W.C.; and of the Auctioneers and Surveyors, 67 and 68, Cheapside, London, E.C., and Leytonstone.

Orchids in Flower.—Tuesday, April 24.

MESSRS. PROTHEROE and MORRIS desire to announce that their NEXT SPECIAL SALE of ORCHIDS in FLOWER will take place as above, for which they will be glad to receive Notice of Entries as soon as possible.

Wednesday, April 25.

SALE of STOVE and GREENHOUSE PLANTS from SAMPLE.

MESSRS. PROTHEROE and MORRIS desire to announce that their NEXT SALE from SAMPLE will take place at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY, April 25, for which they will be glad to receive Notice of Entries as soon as possible.

Kingston-on-Thames.—Without Reserve.

Important to Exhibitors, Gentlemen, Florists, and others. The whole of the well-known collection of Specimen Exhibition STOVE and GREENHOUSE PLANTS, which have taken so many Prizes at the leading Metropolitan and Provincial Shows, by order of Messrs. T. Jackson & Sons, who have given up exhibiting.

MESSRS. PROTHEROE and MORRIS are instructed to sell by AUCTION, on the Premises, The Nurseries, Kingston-on-Thames, adjoining the Railway Station, on THURSDAY, April 26, at 12 o'clock punctually, without reserve, the above valuable COLLECTION of EXHIBITION PLANTS, amongst which will be found numerous very fine specimen and half-specimen Azaleas, specimen and half-specimen Ericas in great variety, Greenhouse Rhododendrons, Ixoras, Athurium, Scherzerianum, Lycopodium, specimen Hardy Ferns, specimen Palms, and other Decorative Plants.

May be viewed three days prior to the Sale. Catalogues obtainable on the Premises, and of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C., and Leytonstone, E.

Friday, April 27.—Established Orchids.

A portion of the well-known collection of ESTABLISHED ORCHIDS, by order of C. Dorman, Esq., of The Firs, Laur Park, Sydenham, who is making alterations to his Greenhouses, necessitating the disposal of some of the Plants.

MESSRS. PROTHEROE and MORRIS are favoured with instructions from C. Dorman, Esq., to sell by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, April 27, at half-past 12 o'clock precisely, a portion of his well-known collection of ESTABLISHED ORCHIDS, amongst which will be found the following valuable plants:—

Lelia purpurata, magnificent plant/12 bulbs, 22 leading growths, 12 sheaths	Cymbidium pendulum atropurpureum, very fine plant (rare)
Cattleya: exoniensis, good plant	Cymbidium Paris-hii, good plant
.. Baneckiana superba, rare	Vanda Sanderiana, splendid plant, good variety, 4 leads
.. Wegerii	Cypripedium insigne Wallacei
Lelia epaphia	Dendrobium Leechianum

Dendrobium noble Cooksoni.

On view morning of Sale, and Catalogues had.

To Brentham Park Collection of Orchids.

Highly important unreserved sale of the first portion of this celebrated collection of ESTABLISHED ORCHIDS, by order of Robert Smith, Esq., who is giving up their cultivation.

MESSRS. PROTHEROE and MORRIS are favoured with instructions from R. Smith, Esq., to sell by AUCTION, at their Central Sale Room, 67 and 68, Cheapside, London, E.C., on TUESDAY and WEDNESDAY, May 1 and 2, at half-past 12 o'clock precisely, without Reserve, the first portion of this well-known collection of ESTABLISHED ORCHIDS, amongst which will be found the following and other rare species:—

Cattleya Bluntii.	Lelia anceps Sanderiana.
.. oniensis superba.	Oncidium oranthorrhynchum album.
.. Boneri alba.	Odontoglossum Jenningsianum paraguayatum.
.. Bate (autumn flowering var.).	Celoglyne Massangeana.
Lycas Skinneri alba.	
Lelia anceps Dawsoni.	

Plants will be sold privately prior to the Sale. On view morning of Sale. Catalogues of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Wednesday Next.—(Sale No. 7665.)

COLLECTION of ESTABLISHED ORCHIDS.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C. on WEDNESDAY NEXT, April 18, at half-past 12 o'clock precisely, the COLLECTION of ORCHIDS formed by A. G. Wallace. Amongst other fine things will be found Celogyne Massangeana, C. cristata Lemoiana, Oncidium Marshallianum, granar., Angraecum sesquipedale, Aerides crassifolium, and the various varieties of Odontoglossums, Dendrobis, Oncidiums, Cattas, Vandas, &c.

On view morning of Sale, and Catalogues had.

Wednesday Next.—(Sale No. 7665.)

SEV. CASES of ORCHIDS from Burmah, received direct, Sale, without reserve, comprising some splendid pieces of Dendrobium supposed to be the fine long-bulbed form O. Brynerianum, D. Wardianum, D. crassinode, D. Costoxum, D. Falconeri, Cymbidium species, probably Govianum, Celogyne, Cypripediums, &c.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, April 18.

On view morning of Sale, and Catalogues had.

Sale Thursday, April 26.

At 38, King Street, Covent Garden, W.C.

EDROBIUM NOBILE SANDERIANUM, Rehb. fs.

This undoubtedly one of the very finest Dendrobium in existence, and a close rival to Dendrobium noble nobiliss, which it much resembles. It is as large and finer in form, has a far finer and larger black centre. See drawing of its wonderful Dendrobe.

MR. J. C. STEVENS has received instructions from Mr. F. Sander to include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, the entire stock (except bulbs kept for propagating) of DENDROBIUM NOBILE, Sander's variety. For beauty and grandeur there are no orchids in existence to rival this Dendrobe.

On view morning of Sale, and Catalogues had.

Thursday Next.—(Sale No. 7666.)

VALUABLE IMPORTED ORCHIDS. DENDROBIUM JAMESIANUM. 1000 ODONTOGLOSSUM VEXILLARIUM. CATTLEYA SANDERIANA.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, April 19, at half-past 12 o'clock precisely, by order of Mr. F. Sander, a quantity of ODONTOGLOSSUM VEXILLARIUM, in splendid order with healthy bulbs and fine foliage. The importation comes from an entirely new district, and many extraordinary varieties may be looked for amongst those offered, such as the rare O. v. radiatum, O. v. bicolor, O. v. insigne, and other choice forms, and we are quite certain that never before have such fine varieties been offered for sale.

Also a fine consignment, just arrived, of the beautiful DENDROBIUM JAMESIANUM, in excellent order. This Dendrobe is one of the very finest in cultivation, its pure white blossoms lasting in perfection for a considerable time, and for cutting and exhibition purposes this Orchid cannot easily be surpassed.

At the same time will be offered a fine lot of CATTLEYA SANDERIANA, with fine foliage and sound eyes, together with quantities of C. Mossie, Odontoglossum grande, Vanda Denissoniana, Cypripodium punctatum, Cymbidium Lowii, Cattleya Lawrenceana, Odontoglossum Pescatorei, Dendrobium Farmeri, and many other ORCHIDS.

On view morning of Sale, and Catalogues had.

Thursday Next.—(Sale No. 7666.)

10,000 grand Bulbs of LILIUM AURATUM, and other Bulbs, direct from Japan.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, April 19.

On view morning of Sale, and Catalogues had.

Sale Thursday, April 26.

At 38, King Street, Covent Garden, W.C.

Very rare and fine ONCIDIUM—ONCIDIUM SPLENDIDUM.

MR. J. C. STEVENS has received instructions from Mr. F. Sander to sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, a splendid importation of ONCIDIUM SPLENDIDUM. For many years past we have tried to discover the habitat of this most important Oncidium, and have now succeeded. The flowers are 4 inches long, similar to Oncidium tigrinum, but more lovely. For full description see Catalogue, which may be had in due time of the Auctioneers.

On view morning of Sale.

Sale Thursday, April 26,

At 38, King Street, Covent Garden, W.C.

Specially rare and fine ONCIDIUM ONCIDIUM BIFOLIUM MAJUS. Only once this so beautiful Oncidium has been imported, and the locality in its native country was lost for many years. We have succeeded in rediscovering this fine Orchid, and

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, by direction of Mr. F. Sander, a specially grand importation, in unusually fine order, of ONCIDIUM BIFOLIUM MAJUS. This handsome Orchid has often been eulogised by the Press, and by all to whom it is known. It is, however, so rare, that only one or two old collections of Orchids contain it. The flowers are very elegant, and produced on drooping spikes, large, and sepals and petals are chocolate, marked with yellow, and lip deep golden yellow. It is a plant of most easy culture, and it gives us special pleasure to be enabled to offer such a fine and so rare an Orchid.

On view morning of Sale, and Catalogues had.

Sale Thursday, April 26

At 38, King Street, Covent Garden, W.C.

A New Species of LADY'S SLIPPER, from New Guinea. CYPRIPIEDUM ROTHSCHILDIANUM, Rehb. f.

Now in flower at the St. Albans Orchid Establishment, and pronounced by those who have seen it, one of the very finest Cypripediums ever introduced.

MR. J. C. STEVENS has been instructed by Mr. F. Sander to sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, the entire stock of CYPRIPIEDUM ROTHSCHILDIANUM.

On view morning of Sale, and Catalogues had.

Sale, Thursday, April 26,

At 38, King Street, Covent Garden, W.C.

2,000 ODONTOGLOSSUM HARRYANUM.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, a most wonderful importation of ODONTOGLOSSUM HARRYANUM, and undoubtedly the grandest lot that could possibly be brought to this country; the masses are superbly leaved, and marvellous varieties may be looked for. The plants were brought home under the special care of Collector, who describes this lot as containing flowers of enormous size and brilliant colouring; we are sure that nothing like them has previously reached this country.

On view morning of Sale, and Catalogues had.

Sale, Thursday, April 26.

At 38, King Street, Covent Garden, W.C.

CATTLEYA AUREA.

Very Grand Importation.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, a specially grand lot of CATTLEYA AUREA, just to hand in most superb order. This will be found to be the finest importation ever come to the hammer.

On view morning of Sale, and Catalogues had.

The Valuable Collection of Orchids formed by the late John Day, Esq., of Tottenham.
MR. J. C. STEVENS begs to announce that he has been favoured with instructions from the Executors of the late John Day, Esq., to SELL by AUCTION, without the least reserve, at his Great Rooms, 38, King Street, Covent Garden, W.C., his entire Collection of ORCHIDS, consisting of the choicest species and varieties, and including many plants of exceptional interest. Amongst other varieties will be found a grand collection of the rarest and choicest CYPRIPEDES, in the finest health.
 The First Portion of this Collection will be SOLD on WEDNESDAY and THURSDAY, May 9 and 10.
 N.B.—For fuller particulars, see *Gardeners' Chronicle*, March 24.

FOR SALE, a NURSERY, as a going concern. A well appointed Nursery, on the Bromley Road, a Beckenham, Kent. The Nursery is situated in an excellent neighbourhood, and a good Jobbing Trade may be made. A large Business has been done in Cut Flowers in past years. The Houses and Stock are in first-class order, and may be inspected.
 For further particulars apply to Mr. E. ELLIS, Solicitor, 23, Birch Lane, London, E.C.; or, to Messrs. JOHN LAING AND SONS, Nurserymen, Forest Hill, S.E.

To Nurserymen and Florists.

Cash with order. List of plants in small quantities, entries paid, and testimonials.
EDWARD LEIGH, Ivy Hall, Cranleigh, Surrey.

100 PACKETS OF FLOWER SEEDS for 1s. Post free, 1s. 3d.
 The extraordinary cheapness will at once cause the reader to say "They must be rubbish," but they are guaranteed to be really good and fresh. The packets of course are small, but they contain enough seed to grow a nice little clump of each kind, and every packet is different and named. They are giving most unqualified satisfaction, as indeed they cannot fail to do. Prepayment not necessary if references are sent.
AMATEUR FLORIST,
LIVERPOOL ROAD, ST. ALBANS.

A Good Potato of Sterling Worth.
MAIN CROP KIDNEY,
W. W. JOHNSON AND SON.
 First-class Certificate awarded by the Committee of the Royal Horticultural Society, September 21, 1887.
 It was tested by cooking, and described by the Committee as a "White Kidney, with clean, rough skin, white flesh, a good cropper."
 This Potato is pronounced by competent judges as likely to become one of the best Main Crop Potatoes of the future. It has entirely resisted disease; tubers have a handsome appearance, with very shallow eyes; are white, mealy, and of the finest flavour when cooked. In excellent condition for the table from the time of taking up until late in the spring.
 Price per peck of 14 lb., 6s.; per bushel, 18s.
 Wholesale of Messrs. HURST AND SON, 152, Houndsditch, London, E.; and from W. W. JOHNSON AND SON, Seed Potato Growers and Seed Merchants, Boston, Lincolnshire.

DAHLIAS — DAHLIAS — DAHLIAS.—Healthy young plants for sale, of the following sorts grown in 60 pots:—
 CONSTANCE, White Cactus, 25s. per 100; 3s. 6d. per doz.
 GUAREZIE, Scarlet Cactus, 30s. per 100; 4s. per doz.
 Other named varieties, true to name, 18s. per 100; 2s. 6d. per doz.
 TROPEOLUM VESUVIUS, from store pots, 6s. 100. Single HELIOTROPE, Miss Nightingale, do.—8s. 100. [pots 12s. 100].
G. WATTS & SONS, Nurserymen, Springbourne, Bourne-mouth,

HARTLAND'S IRISH-GROWN DAFFODILS.

"The perfumed amber cup which, when March comes, gives the dry woods and windy woods, and speaks the resurrection."

TRUE to the poetic idea of an ITALIAN CLIMATE. In Ireland, at Temple Hill, Cork, thousands are now "tossing their heads in spiteful dance." The following to bloom in March:—

50,000 PRINCES	30,000 VARIIFORMIS
30,000 NOBILIS	10,000 CORBULARIA CITRINUS
20,000 ARD-RIGH	10,000 PALLIDUS FRECK
8,000 MOSCHATUS	100,000 TELAMONIUS PLENUS
8,000 CAPAX	10,000 PSEUDO-SCOTICUS.

A semicircular border, containing over 5000 Bulbs of the beautiful WHITE DAFFODIL "LEDA," is a sight not to be seen in the United Kingdom. William Baylor Hartland's unique Collection of Rare White Daffodils will all bloom this month.

* Boxes of Cut Specimens, true to name, from 5s., 7s. 6d., to 10s. With each order for a "Box of Blooms" will be presented a copy of his "Little Book" of Daffodils, unique as a work of art, and faithfully illustrated by Gertrude Hartland, the Book by itself being 1s. 6d. each copy.

Address for Blooms to
TEMPLE HILL, CORK.

FRUIT TREES, SEVENTY-FOUR ACRES.

APPLES, PEARS, PLUMS, CHERRIES, PEACHES, NECTARINES, APRICOTS, and other FRUIT TREES, as Standards, Dwarfs, Pyramids, Bushes, Cordons, and Trained Trees, in great variety.

OUR WONDERFUL

CINERARIAS.

They are a long way the Most Complete Collection in the World, and all for Seeding.

W. J. MURPHY, Esq., Western Road, Clonmel, Ireland.

"Your Cinerarias are splendid. The gardeners around here are delighted with them. They simply excel your coloured plates. In size, substance, richness of coloring, and dwarfness, so important for conservatory decoration, few strains come near, and I have never seen any to approach your lovely flowers."

Mr. ALFRED BISHOP, Gardens, Westley Hall, Bury St. Edmunds.

"I wrote an article in one of the London gardening papers on growing Cinerarias, at the same time forwarded blooms to the editor, and no doubt you have seen the very high character he gave them. I may further say I have had many visits from gardening friends, and one and all have been struck with the fine flowers and exquisite colours; have also had many letters from different parts, asking where I purchased my seed from, and my answer has been—"From Cannell's, The Home of Flowers, Swanley, Kent."

Rev. C. E. WALKER, March Rectory, Cambridgeshire.

"Messrs. Cannell's Seeds DESERVE their world-wide reputation."

DANIELS BROS., Town Close Nurseries, NORWICH,

CARNATIONS AND PICOTEES.

(PLANT AT ONCE.)

I have pleasure in drawing the attention of the Trade and Retail Buyers to my very extensive stock of Carnations and Picotees, which is probably the largest collection in the Trade. The plants this season are strong and healthy, and intending buyers would do well to procure and plant at once, that they may get well established before the warm weather comes.

The Collection consists of the following sections:—
SHOW VARIETIES.

A very complete collection, including all the finest of the Florists' sorts, especially those which are of good constitution.

BORDER VARIETIES (to name).

These have for many years been a great speciality with me. An enormous quantity of them are sold annually. They are all good free vigorous sorts, and such as produce plenty of flower, and are, in consequence, specially suited for the Trade who want quantities of Carnations for cutting.

SELFS and CLOVES.

A very fine collection, including many varieties of recent introduction. These are specially adapted for border planting; they are mostly all good free flowering, distinct, and bright-coloured sorts. Many of them are strongly Clove-scented.

YELLOW GROUNDS.

A unique collection, which has been materially extended during the last two seasons, and there are now included amongst them many sorts which are as free, both in growth and flower, as the Border varieties, or the SELFS and CLOVES, and are, in consequence, well fitted for outdoor planting, and charmingly suited for the purpose of supplying cut flowers.

CATALOGUES, with full descriptions and prices of the varieties which constitute the various collections, may be had, gratuitously and post-free, upon application to

S. SHEPPERSON,
 FLORIST and SEEDSMAN,
PROSPECT HOUSE, BELPER,
DERBYSHIRE,

Begs to inform the readers of this Paper that he is prepared to execute orders for the following plants, all of which are of the very finest possible strains that money can buy. They have all been grown on the Derbyshire Hills, and are therefore very hardy, and warranted to succeed and bloom well. All carriage free for cash with order.

DESCRIPTIVE LIST of Florist Flowers, Ad. stamps, or free to customers.

- PANSIES.**—A great specialty Five Silver Cups and other Prizes awarded during 1887, probably the best collection in England; the cream only of the most noted raisers, the latest new sorts, and the winners at all the great shows. Good plants, correctly named, Show or Fancy, twelve for 3s., twenty-five for 5s. 6d., Carriage free for Postal Order.
- FANCY PANSIES.**—Unnamed, six for 1s., twelve for 1s. 6d., twenty-five for 2s. 6d., Postal Order. All different and first-class sorts, free.
- CHRYSANTHEMUMS.**—Great special culture, the best and most distinct varieties only, of large-flowered, incurved, reflexed, early and late bloomers, pompons, Japanese, &c., including many grand new varieties by the best English, Continental, and American raisers. Twelve distinct varieties, named, well rooted plants, for 2s.; twenty-four for 3s. 6d., free.
- GRAND NEW CHRYSANTHEMUMS.**—The cream only of the new varieties of 1886 and 1887. Six for 2s., twelve for 3s. 6d., named distinct varieties.
- HOLLYHOCKS (Double).**—Chubers' very finest and most select strain. Twelve varieties for 2s. 6d., six for 1s. 6d.; six extra strong for 2s., Postal Order, free.
- CANTERBURY BELLS.**—Grand new colours and new forms, double and single Telescope, Candelabrum, and other varieties. Twelve good plants, to bloom well, for 1s.; twelve extra strong for 1s. 6d., Postal Order, free.
- PURE SNOW-WHITE AURICULA.**—One of the most beautiful hardy spring flowering plants in cultivation. Two for 1s., free.
- AURICULAS.**—A really grand strain of this deliciously scented old-fashioned favourite flower, including Turner's Alpines, Dean's new laced varieties, Dewsbury's Giant, and other really fine sorts. Good plants, that will bloom well this spring, three for 1s., six for 1s. 9d., twelve for 3s., all free.
- POLYANTHUS.**—Finest strain grown, fine large trusses and blooms, and splendid colours. Cannot be surpassed. Twelve for 1s., twenty-six for 2s., 100 for 7s., free. All good blooming plants.
- POLYANTHUS and PRIMROSE.**—Jack-in-the-Green, Hose-in-hose, and other rare and curious forms unnamed. Six distinct sorts for 1s. 6d., twelve for 2s. 6d., free.
- THE NEW DOUBLE SCARLET GEUM.**—Quite hardy. Free bloomer. Grand for cutting or decoration. Twelve for 1s., twenty-five for 2s., Postal Order, free.
- CANNATIONS, PICOTEES, and CLOVES.**—Strong plants, from finest show flowers only, including many new sorts. Will give a mass of bloom. Twelve beautiful varieties for 2s. 6d., six for 1s. 6d., free.
- SCABIOSA (Double).**—A really fine hardy plant for garden decoration or cut flowers. Many fine colours. 1s. per dozen, free.
- PRIMULA CASHMIRIANA.**—Splendid hardy mauve-coloured spring flowering plant. Three for 1s., free.
- COLLECTION of twelve HARDY BORDER PLANTS,** distinct and useful for decoration and cutting purposes, for 2s., free.
- WALLFLOWERS.**—Double German, Cranford Beauty, Wars' dark red, and Kershaw's bright red. 1s. per dozen, free.
- FOXGLOVES.**—Gloxinia-flowered, Dean's grand new large spotted varieties, very fine, twelve for 1s. 6d., six for 1s., free.
- ALSO the FOLLOWING FREE-BLOOMING HARDY PLANTS:** should be in every garden; all at 1s. per dozen, free:—Pure white Thrift, fine edging and spring flower; Malva moschata alba and rosea, beautiful pure white and rose, blooms all summer; Sweet Williams, the finest dark and giant Auricula-eyed; Arabis albidia, white spring-flowering plant, beautiful variegated foliage.
- STRAWBERRY PLANTS.**—Selected crowns, transplanted, Black Prince Improved, British Queen, Alpha, Pauline, Sabreur, Viscomtesse II. de Thury, Duke of Edinburgh, King of the Earlies, and other extra sorts. 3s. per 100, free. Also the Captain (Laxton's), twenty for 1s., free.

THE FORESTRY SCHOOL AT
 COOPER'S HILL.

WE have so often advocated the establishment of a properly equipped Forest School in this country as part of the requirements needed for the education and training of foresters, gardeners, and farmers—of all, in fact, who have to do with plant-culture—that we can but rejoice to see some part of the plan in active operation. The whole has been accomplished so quickly and so quietly, that we expect the statement we now extract from the columns of *Nature* will prove new to the majority of our readers, even to those interested specially in forestry:—

"The Forestry School at Cooper's Hill is intended in the first place for the education of a certain number annually of young officers for the Indian Forest Department. The arrangements are, nevertheless, of such a kind that private students are admitted to the forestry course, in as far as space is available, and on condition that they conform to the rules.

"The Forestry School itself consists of a block of buildings attached to the Royal Indian Engineering College, on the brow of Cooper's Hill, near Staines, and looking north over Rannymede and the valley of the Thames. It is within a convenient distance from London, the traveller arriving at Egham (the nearest station on the London and South-Western Railway) in from forty-five to sixty minutes from Waterloo. Windsor Great Park is within a mile of the beautiful and spacious grounds in which the College stands, and the fine trees of all kinds to be met with in the neighbourhood give to the situation much that is desirable for a centre for the teaching of forest botany, and several parts can be made use to a certain extent for illustrating subjects in forestry proper.

The building of the Forest School itself consists of large and small class-rooms, a museum, and the well-designed and appointed botanical laboratory. In this block the students pursue their main studies—botany, forestry, and entomology; their other studies—engin-

earing, surveying, mathematics, geometrical and freehand drawing, physics, geology, and one or two other subjects to be referred to presently—are pursued under the direction of the various Professors in the class-rooms—and laboratories of the Royal Indian Engineering College, to which the Forestry School is attached.

"The forest museum is a convenient, well-lighted room, rapidly filling with useful collections of specimens illustrating the chief departments of forestry. Among the most valuable and conspicuous objects in this splendid collection may be mentioned the series of European and Indian timbers, which are so disposed that the student has ready access to them, while the Professors are able to refer to them in lecturing, and thus make the teaching, in the best sense of the word, practical. Then there is a remarkably complete and interesting collection of implements used in forestry, and there are models of timber-slides, apparatus for catching timber, and other forest works, also so disposed that every student can handle and examine them, and learn their uses with facility. Another valuable feature in this museum is the series of economic products of Indian plants. This is of course not complete, but the greatest credit is due to all concerned for bringing together for such useful purposes so many instructive specimens of fibres, seeds, barks, fruits, food materials, &c., from the chief representative Indian plants; and when it is remembered that the Forestry School is so young in this country (it was started in September, 1885), it is the more praiseworthy that the authorities have made such good use of their opportunities and time. The collections must no doubt receive numerous additions as time passes, for it is well known that a museum takes many years to bring within measurable distance of completeness, but the Cooper's Hill museum is already fairly filled, the nucleus of the collections having been derived from the late Indo-Colonial Exhibition, and from the Royal Gardens, Kew. It would require too much space to enumerate the remaining interesting features of these instructive series of forest objects: specimens of timber showing the changes due to abnormal growths, the healing of wounds, the various injuries produced by unsuitable environment or by the attacks of insects and other living organisms; and last, but by no means least, a unique collection showing the ravages of those fungi which injure timber trees, collected by Professor Robert Hartig, of Munich, and presented to the School, and a collection of the more injurious forest insects, presented by Herr Oberforstrath Jndeich, of Tharand. There is also a small herbarium, of a particularly interesting character, containing an excellent series of Conifers and other trees.

"The botanical laboratory has just been completed, and is, without doubt, one of the best designed small laboratories, for its purpose, that we have seen. It consists of an oblong room running east and west, and lighted from the north and east by windows arranged conveniently for work with the microscope. There are also tables and apparatus for experimental demonstrations in vegetable physiology; provision will exist for cultivating seedlings and plants at constant temperatures, for measuring growth, and for exhibiting the influence of light, gravitation, &c., on the growth of plants; and arrangements for showing the quantities of water given off from transpiring leaves, for developing plants in water-cultures, &c. The students are supplied with microscopes, reagents, and accessories, and are taught to familiarise themselves thoroughly with all modern appliances bearing practically on their studies.

"The above-mentioned block of buildings also includes one small and one larger lecture-room, which are provided with necessary teaching appliances. The series of botanical diagrams especially are remarkably good, and in fact many of them are unique, being the private property of the Professor of Botany, and drawn and coloured by himself. Another feature which must not be overlooked is the projected botanic garden. This will consist of a series of seed-beds, &c., illustrating the raising of

forest trees, and of beds of plants chosen from the most important natural families, in order that the students may familiarise themselves on the spot with their chief characteristics. This botanic garden is now in process of being laid out, and it will be ready for the use of students in a short time.

"The courses of studies followed by the forest students are admirably adapted to the wants of practical men whose lives will be largely spent in the creating, planting, preserving, and using of forest and other trees. Obviously, such a course must comprise several branches of teaching, the one thing common to all being that they bear upon the practical needs of the future forester. That the same training applies to a planter or estate-manager needs no remark, and portions of the course would be suited for others engaged in work in woodlands, and in the colonies, &c. The full course, as at present set forth in the syllabus of studies, is as follows:—

"The student begins work in September, and attends lectures regularly during two academical years. In engineering, he is taught the principles of road-making, and the building of forest bridges and other structures; he is also instructed in the practice and theory of surveying under the care of the Professor of Surveying. In his first year he studies for two terms under the instructor in geometrical drawing, and in his second year receives lessons in the keeping of accounts. To these subjects may be added freehand drawing and a modern language. In addition to these more technical subjects the student attends certain short courses in mathematics and in applied mathematics, under the Professors of these sciences; he also studies physics—in lectures as well as in the laboratory—entomology, and geology. A short course on organic chemistry is now being commenced.

"The rest of his work consists in the special training as a forester, and it may safely be stated that there is no other centre in the empire where so thoroughly and excellently designed a curriculum for a forester or planter can be obtained. The two subjects of forestry and botany are under the care of separate Professors. Dr. Schlich lectures on forestry, dividing his subject as follows:—In the first year he deals with the various soils, climates, and the regulating effects of forests on these; sylviculture, artificial and natural woods; the tending, thinning, pruning, &c.; the protection of forests against man and other animals, and especially insects, and against injurious plants, climatic influences, &c. During the second year the student is instructed in the utilisation of forests; the technical qualities of woods; the felling, shaping, transportation, &c., of timber; the utilisation of minor forest produce; the preservation of wood; sawmills; charcoal, &c. He then passes to the study of working plans, and especially the arrangement of cuttings; surveying and mapping forests; measurement and determination of ages of trees and forests; and the methods of regulating the yield of forests. The final course of lectures is on forest law. In addition to the lectures the students also make occasional excursions, under the direction of Dr. Schlich; the neighbourhood of Windsor Forest facilitating this important object, and enabling the Professor of Forestry to make his teaching thoroughly practical.

"In botany, under the management of Professor Marshall Ward, the students are instructed by means of lectures, and practical work in the laboratory and in the fields and woods in the neighbourhood. The course in botany is designed to train foresters, not technical botanists: its aim is throughout practical, and directed to teaching the students exact and thorough knowledge of the life-phenomena of the trees and plants which it will be their duty to rear, and take care of, and utilise in the future. Commencing with a short course of thoroughly practical instruction in the elementary biology of plants selected as illustrative types of the vegetable kingdom, the young student is taught the use of the microscope, and how to apply it practically in examining the tissues of plants. He is then instructed in the organography and anatomy

of plants, learning (not only in lectures, but also in the laboratory and in the field) what the organs of plants are, and what they do; so that roots, stems, leaves, buds, bulbs, tubers, tendrils, thorns, &c., become to him, not mere abstractions, but objects on which his attention will be continually fixed as active parts of plants. The study of cells and their contents, of epidermis and stomata, of vascular bundles and other tissues—of wood, bark, cambium, and so forth—is carried on thoroughly, not only that the forester may know the principles by which to classify and recognise timbers and foreign products, and learn their uses, but also that he may understand what these various parts of the plants do in Nature; how heart-wood is formed, how the timber grows and may be improved, how wounds may be healed over, how the roots take up substances from the soil, and how the plant makes use of them, and so forth. The student concludes his first year's study in botany (in the early summer) by familiarising himself with the names and systematic position of the plants in the neighbouring fields and woods, especial attention being paid to the important trees and shrubs, and their relations to the forest flora of India.

"During his second year the student is instructed in the physiology of plants—how they feed, respire, and chemically change substances in their interior; how they grow, and are affected by light, gravitation, temperature, moisture, &c.; how they are reproduced hybridized, and so on; the effects of various agents, in the production of wood, in influencing the fertility, and so forth. The course is completed by the study of the diseases of plants, and especially of timbers, and how their effects may be minimized or healed.

"As special features of the greatest importance, it should be mentioned that the senior students pay periodic visits under the direction of Prof. Marshall Ward, to the magnificent gardens, museums, and plant-houses at Kew, in order that their knowledge of the important economic plants and their products shall be real. They see the plants growing, learn to familiarize themselves with their peculiarities and habits and uses, and are thus not strangers to them when they land in India. Secondly, the young foresters are taken abroad, and taught what life in the forest really is. At the completion of their first year's studies, they accompany the Professor of Forestry to Scotland, or to the New Forest, or to the Forest of Dean, as may be decided for the year; and at the end of their second year they are taken to the Continent for three or four months' practical work in Germany and France, to examine the systems pursued in the large and more systematically managed forests of those countries, and thus to study the art of forestry in practice under conditions more resembling those met with in the huge and valuable forests of India.

"During the summer of 1887, for instance, the young officers who are now in India were taken to Bavaria, under the direction of Dr. Schlich, accompanied by Prof. Marshall Ward and Mr. Gamble. They visited the magnificent museum and laboratories of the Forestry School at Munich, the Forest of Freising, the Willow nurseries and plantations at Oberberghausen, the Spruce forests at Hohenaschau, and the timber depot at Traunstein. They then proceeded to the Austrian forests of the Salzkammergut; and later to the Forest School and school forests at Nancy, the Cork Oaks and Pine forests in the Esterel, and the Pinus maritima forests on the west coast of France, used for the preparation of turpentine as well as for timber.

"With this practical tour, the training of the young forester in Europe stops, and he departs for India to assume the new duties and large responsibilities of his life as a forest officer under the Imperial Government."

GRASS SEEDS FOR THE LONDON PARKS.—Messrs. JAMES CARTER, AND Co. have again been selected to supply their tested grass seeds to form lawns in the London Parks under the control of the Metropolitan Board of Works.

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM ROTHSCHILDIANUM n. sp.*

This very surprising plant appears to be the nearest ally to *Cypripedium præstans*. Its leaves are unusually long, more than 2 feet in length, 2½ to 3 inches in width, green, glossy, very strong. The peduncle is said to be three-flowered, but may become more florid later. It is reddish with few very short hairs. The green bract is spatheaceous, not equal to half the stalked glabrous ovary, and has a few dark longitudinal stripes at the base. The fresh flower at hand is much smaller than my wild ones, which are quite equal to those of the best of its Papuan consort, *Cypripedium præstans*. Odd sepal cuneate oblong acute, yellowish, with numerous longitudinal dark, almost blackish, stripes, also white at the borders. Lateral sepals united into one nearly equal smaller shorter body. Petals undulate at the base, linear, narrow at the top, yellowish-green with dark longitudinal lines, and dark blotches at the base. Lip like that of *C. Stonei* and *C. præstans*, very strong, almost leathery, cinnamon-colored, with ochre border to the mouth, and with an ochre-coloured mid-line underneath. The most peculiar point is the staminode. It is quite novel. It has a stout base, and rises erect, bending down into a beak-like, narrow process, covered partly with hairs. These hairs consist of rows of cells, and the cells have several girdles of numerous tubercles in their circumference. The numerous hairs are thicker, and white at the top. This staminode looks much like the throat and head of some bird, such as a crane.

It is one of the most astonishing introductions we have ever seen, and is due to the indefatigable zeal of Mr. F. Sander, who is desirous that it bear the name of Baron Ferdinand de Rothschild, of Aylesbury. This I accede to with great satisfaction. *H. G. Rehb. f.*

PHALANOPSIS LEDA, n. hybr.

This attractive novelty has just reached me from Messrs. James Veitch & Sons, of Chelsea, in whose nursery it was raised. The plant is a stray seedling, detected about seven years ago growing in a pot in which no other *Phalanopsis* seed had been sown, so that nothing certain is known of its parentage. It has at present three elliptical-oblong deep green leaves, the last developed being 6 inches long. The flower is over 2½ inches across, much resembling *P. amabilis* (*P. grandiflora*, Lindl.) in shape, and having some yellow at the base of the front lobe of the lip and on the front margin of the side lobes, which points out that species as almost certainly one of the parents. The tendrils are broadly anchor-shaped, like those of *P. Stuartiana* ×, but a little more elongated, while on the inner half of the lateral sepals near the base are some purple spots, both of which point to this or some hybrid of *P. Schilleriana* and *P. Aphrodite* as the other parent. Nothing else would account for the anchor-shaped tendrils, unless, of course, *P. Schilleriana* itself, and the green leaves are more against this than against some hybrid which had already half blood of a green-leaved species in it. *P. rosea* seems out of the question, for with *P. grandiflora* it would give a hybrid much like *P. intermedia* ×, and this, with *P. grandiflora*, gave *P. F. L. Ames*, with the tendrils quite narrow at the base, as would indeed be expected. The side lobes of the lip are of the usual shape, but not pointing a little backward, as in *P. Stuartiana* ×, and with a few very distinct purple spots below the middle, and a few bars of the same colour on the stalk of the lip. Crest yellow, with purple spots, as in *P. Stuartiana* ×. Front lobe of lip densely covered with minute dots of rosy tint, its apex and the tendrils pure white. It is as handsome as others of

* *Cypripedium Rothschildianum*, n. sp.—Affine *Cypripedium præstans*: pedunculo minute velutino; sepalis oblongis acutis margine ciliolatis; tepalis basi undulatis linearibus antrorum attenuatis, labellum ultra bis superantibus; labello coriaceo bene angulato, calcei ore retuso; staminodii petiolo crasso, corpore lineari deflexo, superficie hinc capitato pilosa. Ex insulis Papuan. imp. exc. Sander, *H. G. Rehb. f.*

the group, which, except in the characters I have pointed out, it closely resembles. If I have interpreted its characters aright, the blood of three distinct species, viz., *P. grandiflora*, *P. Aphrodite*, and *P. Schilleriana*, are represented in it. *R. A. Rolfe.*

THE BULB GARDEN.

PORTUGUESE NARCISSI.

KINDLY permit me to point out an error in a note under the above heading at p. 433. It is there stated that "*N. cyclamineus* was described by Parkinson in 1640, and figured in Rudbeck, *Theat. Flor.*, 20." Now as a fact, Parkinson does not mention *N. cyclamineus* neither in his *Paradisus* (1629—56) nor in his *Theatrum Botanicum* of 1640. The fact is, *N. cyclamineus* is figured by P. Vallett in the *Jardin du Roy*, Paris, 1623, and in the anonymous *Theatrum Floræ* of 1633. The last-named folio was first published in 1622, but I have not seen that edition. It seems probable that this book contains the earliest figure published of this remarkable plant.

The Rudbecks, father and son, published figures of many Narcissi in their great and now rare *Campi Elysi*, 1701, but I need scarcely say that they had nothing to do with the rare folio, *Theatrum Floræ* of 1622—33—a work quite unique in its way, and remarkable for the fine bold and free drawings it contains.

Dean Herbert and Haworth are primarily answerable for confounding or connecting the *Theatrum Floræ* with Rudbeck's name, and at a later date the book became confounded in a similar manner with Parkinson's *Theatrum Botanicum*, in which Narcissi are not even mentioned, as I believe.

I have paid much attention to the literature of the Narcissus, and spent days last year in the British Museum in looking over and tracing figures from the *Campi Elysi* and other rare works. I also especially visited the Sherardian Library at Oxford, wherein Professor Bayley-Balfour most courteously showed me beautiful copies of the *Jardin du Roy*, *Theatrum Floræ*, and the unique copy of the *Campi Elysi*, and other rare books, which I should recommend visitors to the Oxford garden to see for themselves if at all interested in botanical literature.

Having been the first person, as I believe, in modern times to allude to the authenticity of the old portraits of *Narcissus cyclamineus*, I also suggested its being possibly still in existence in the *Gardeners' Chronicle*, 1885, December 19, pp. 789—790, where I observed, prior to the re-discovery of the plant near Oporto in 1886:—"This is such a curious thing, that I give a small tracing of the flower (fig. 185), in the hope that some modern proper after old Daffodils may recognise this as an old friend, if he should perchance meet with it in his rambles during the next spring." As a matter of fact, A. W. Tait, Esq., and his aide-de-camp, Mr. Johnstone, did find it near Oporto "during the next spring," and I regard myself as its godfather in a way, and feel quite proud in having been instrumental in getting the hardy little foundling rechristened in the *Botanical Magazine*, t. 6950.

Both Haworth and Herbert were weak in their literary knowledge of the Narcissi, and both were mainly dependent on the late Rev. H. G. Ellacombe, of Bitton, for cultivated specimens. *F. W. Burbidge, F.L.S.*

VERNAL CROCUSES.

Despite the weather—which has been of a character to seriously impair the beauty of the flowers—the spring Crocuses are very fine this year. The yellows are always the earliest to bloom, and what a wealth of blossom they give. About seven years ago I planted some clumps of the common yellow Crocus in a bed on a north aspect, and the bulbs have so increased that they have grown into large size, and bloom a week or two later than those on the south side. I placed among them, so as to fill a circular bed, some clumps of the Siberian Squill, and I made a permanent edging of white striped and blue Crocuses. This

bed is now a charming floral picture, only that the cold north-easterly wind detracts from rather than adds to the beauty of the blossoms. For massing and for making permanent lines the following are the best varieties of Crocus, viz., the Large Yellow, which should be plentifully used both for the sake of its earliness and also for its rich golden colour; David Rizzio, blue-purple; Ne Plus Ultra blue, edged with white; Pride of Albion, heavy violet-striped; Sir Walter Scott, light violet-striped; and Mont Blanc, white. These are all good old standard sorts of great beauty and usefulness, producing freely large blossoms. There are other varieties of more recent introduction, but those I have named can be depended upon. Early planting is a matter of importance. Crocuses can be had by the first week in September, and they should be planted by the end of October. *R. D.*

THE CROSSING OF FERNS.

(Concluded from p. 126.)

HYBRIDISATION.

A year or two since I was told by one of the most discriminating botanists, Mr. Churchill, that it was now accepted that *Asplenium germanicum* was a hybrid between *A. septentrionale* and *A. rutamuraria*; and as Mr. G. B. Wollaston, of Chiselmhurst, *facile princeps* among British fernists, is entirely of the same opinion, the idea cannot be lightly regarded. I am told that *A. germanicum* is never found where *A. septentrionale* and *A. rutamuraria* are not found, and that where these two species abound it is very rare not to find *A. germanicum*—that it is never found extending over a considerable space as ordinary species do, more or less, but in detached clumps or isolated plants as hybrids, having a difficulty in reproducing themselves, might be expected to do. It is reputed to be barren, and yet it is on record that Sim of Foot's Cray once raised a variety from it, recorded as "accidentatum" both by Mr. Moore and Mr. Wollaston; it cannot therefore be said that it is impossible that a spore might not be thrown from one of such hybrid plants with sufficient constitution and general fitness for survival to establish a new race. There is also the case of *Lastrea remota*, of which four plants were found growing in a clump in Westmoreland, by Mr. F. Clowes, about thirty years ago; nor has it been found elsewhere in this country; it has long been accepted by British fernists as a natural hybrid; though apparently profusely soriferous, it has, after what might have been considered exhaustive experiments, been considered incapable of reproducing itself from spores, and yet it is, I believe, sufficiently established that one of the original plants which Mr. Stansfield has, did once cover the pot in which it was with fertile spores and though the young plants may not yet be in every respect entirely like the parent, they are, I believe, sufficiently unlike every other British Fern to prove their origin: and would it not be unreasonable to conclude that not one of these could have power to reproduce itself with ordinary freedom?

The remarkable "confluent" forms of *Asplenium Trichomanes*, as fertile in appearance as they have hitherto shown themselves to be barren in reality, are considered by those who have most studied the subject to be hybrids, as are also the "microid" forms of *A. Adiantum nigrum* and *A. lanceolatum*. There is also the unique cruciate *Asplenium*, which appeared self-sown in Mr. Clapham's fernery, and the remarkable hybrid *Asplenium* found by Mr. Wollaston in Switzerland. There are two or three other forms marked apparently with the bar sinister, but I pass to less doubtful cases.

To Mr. E. J. Lowe is due the credit of having been the first to raise an unmistakable hybrid between two acknowledged species, which was neither a monster of ugliness nor incapable of reproducing itself from spores. It was no accident, for with deliberate intent Mr. Lowe set himself to produce a cruciate *Poly-stichum aculeatum* by crossing a very narrow cruciate

form of *P. angulare*, well known as *Wakeleyanum*, with a very robust form of *aculeatum*, equally well known as *densum*—two more marked forms could not have been selected. In his first sowing he was rewarded with four plants as narrow and symmetrically cruciate as *Wakeleyanum*, with all the coriaceous texture, the glistening colour and decurrent pinnales of *P. ac. densum*; and on repeating the same experiment he was rewarded with two other plants. A grander form does not exist among British Ferns—the most convincing proof of which lies in the simple fact, that even people quite ignorant of Ferns hardly ever pass by the plant which Mr. Lowe kindly gave me without remarking, to my disappointment, that it is the most striking plant in my collection! The judgment passed by Mr. Lowe on this form is that it is barren, and so the plant with which he has himself experimented may be; but I have equally good grounds for knowing that the plant he gave me is not so, for it has been proved by myself and others to be easy of reproduction from spores. If this distinction between two of these plants be real, it will be recognised as a most instructive fact, and I should also mention that a batch of seedlings, raised from another of Mr. Lowe's four plants by Mr. Carbonell, were, without exception, prostrate and dwarfed. Nor is it without interest in connection with this matter, to mention that Mr. E. F. Fox once raised from a magnificent plant of *P. ac. densum* an abundant crop of plants almost entirely prostrate and dwarfed. But, it may be said by some, "After all, this only proves that *P. aculeatum* and *P. angulare* are forms of the same species." If so, I will simply ask them to define clearly and fully what a species is.

Subsequently to this two other instances of a clear cross between these two species have occurred. Mr. E. F. Fox, from a sowing of a very marked form of crested *angulare* raised accidentally about a dozen plants of *P. aculeatum*, in which the peculiar cresting of the *angulare* in question was reproduced in an unmistakable manner—the crossing having evidently been effected by stray spores from an almost normal plant of *P. aculeatum*, growing in close proximity with the plant from which the spores had been gathered; and I myself raised two plants in which the polydactylous cresting of an *angulare* reappeared in a decided *aculeatum*—a polydactylous *aculeatum* having been previously unknown.

Nor should Mr. Stabler's remarkable *Lastrea* (so well known as *L. f. mas Stableri*) be passed over here; it has been universally regarded by fernists as a cross between two species of the male Fern, the marked character of *L. f. mas Barnesii* being transferred to the more solid substance of *L. ps. mas*. It is easily reproduced from spores.

CROSS-BREEDING.

So far the crossing of species, or hybridisation proper. I will now take a few of the most marked instances of the crossing of varieties, nor will I mention any with regard to which doubt could be likely to arise in any reasonable mind, and I will not confine the instances to any one species.

Years ago, returning from a successful hunt, Mr. Barnes thought he would put to the test the suspicions regarding the crossing of Ferns, of which he could not rid his mind; he accordingly chose two of the most marked forms of *Lastrea propinqua*, both of his own finding—(1) a truncate form, whose claim to distinction lay in the entire deficiency of the upper part of the frond (to the extent of about a third); (2) a very symmetrical crested form, the best of its class—*L. p. cristata* of Barnes. Spores of these were sown together and the result was, I should think, sufficiently conclusive—one plant being an exact reproduction of the truncate form with the addition of the cresting of the pinnae; other plants resembled the crested parent, with deauperation so slight as not to affect the general symmetry of the frond; and there were all intermediate forms between these. Another successful cross of Mr. Barnes was between two perfectly distinct forms of *A. F.-femina*, *Frizellia* and *Craigii*. *Frizellia*, as is well known, has a way of occasionally sending up a normal

frond, and the crested forms of *Frizellia* produce also crested fronds; but the plant of *Frizellia* in question, whenever it attempts to revert, or rather to show its other parent, sends up an unmistakable frond of *Craigii*, a thing never seen before.

Mr. Moly's most marked instance of crossing was with a *Scolopendrium*. He had found a very remarkable variegated form, with bright green bands on a white ground, the latter presenting the appearance of being deficient in one of its tissues, the green portion standing out above it. Mr. Moly was not quite satisfied with this Fern, thinking it too narrow, so he sowed it with a broad form, "*fissum latum*" of Moly, with a view to a cross; and he got a plant of *fissum latum* variegated in the unique manner above referred to.

An experiment by Mr. Mapplebeck with *Scolopendrium* was not less remarkable. He sowed a conglomerate form with a form of *periferens* with astonishing results. In several of the plants the conglomerate character was retained, but in many cases little pouches were distinguishable at the extremities of the leafy portion. It is well known that the conglomerate forms have a way of occasionally throwing a normal frond, but in the case of these crosses fronds of simple *periferens* were thrown, truncate with horn and pouch. Another very striking cross of Mr. Mapplebeck was with *Pteris aquilina*. I had myself raised a crested *flexuosa* *P. aquilina*, a cross between *P. aq. cristata* of Glover and the *flexuosa* form (glomerata of Jacob Jones). Mr. Mapplebeck was so much struck with this plant that he determined to try the same experiment, using spores from his own garden. He raised at least three plants of the same cross—one much more marked than my own.

Mr. Stansfield's first experiment was with the cruciate form of *Athyrium Pritchardii*. Thinking that a crest at the end of the frond would be an improvement to it, he perseveringly sowed crested forms with it until he succeeded in his wish; he tried the same experiment with the congested form, *Grantia*, with similar success. The cresting of Ferns is, of course, no absolute proof of a cross, as it is known to result in many cases from natural development; but the following case speaks for itself:—Mr. Stansfield sowed his own splendid plumose form of *Athyrium* with *Craigii*, and he produced an unmistakable plumose *Craigii*. It was barren, and papyry to an extreme; and, as if to settle for ever all doubts as to its origin, it produced last year a frond of the typical plumosum, simply crested, without a taint of *Craigii*, except the cresting. Mr. Stansfield also raised a remarkable cross between *A. F. f. congestum* and *Craigii*.

It is difficult to say whether Mr. Lowe's crossings of *Scolopendrium* or *Athyrium* were most marked. In the former almost every conceivable combination of *undulatum*, *multifidum*, *marginatum*, and *muricatum* are to be seen in his garden; and it is the same with *Athyrium*. It was Mr. Lowe's extraordinary combinations between *Victoriae* and *proteum*, with crested forms, which roused Mr. Clapham to exertion.

Mr. Clapham confined his experiments to *Polypodium vulgare*, his most marked success being with the finely-cut *Davallia*-like form known as *cornubiense*; he sowed with this a multifid form of *bidium*. Here, again, the proof is conclusive. *Cornubiense* is well known to have a habit of partial reversion—sometimes it is the whole frond, at other times it is a portion only that reverts; these crosses of Mr. Clapham (of which there were about six) revert to an ordinary multifid *bidium* frond, while the finely cut portion is forked at the apex of the frond and the apices of the pinnae, exactly as was to have been expected in such a cross.

I come now to my own experiments, and I must admit that they were originally the result of accident, and that I am mainly indebted to the late Rev. C. Padley for the materials with which I worked; nor can I mention the name of one who was so accomplished a naturalist, and so ardent, discriminating, and successful a fernist, without recording that to none of the southern hunters are the lovers of Ferns more indebted than to Mr.

Padley, for he was as generous as he was successful. The late Dr. Wills was another of this class; and if one mentions in connection with these and with those before mentioned, the names of Dr. Alchin, Mr. Grey of Exeter, Mr. Jackson of Barastaple, Mr. James of Vanvert, Mr. Clowes of Windermere, and Mr. Phillips of Belfast, one will have mentioned all the original pioneers to whom the present and future generations of British fernists are most indebted.

Mr. Padley had given me, among others of his best Ferns, three very marked forms of *P. angulare*, his *polydactylum* from the Vale of Avoca, his *multilobum ovale* (the divisions of whose pinnales are not less marked than pretty), and his *inaequale variegatum*, an entirely unique form. Being very much struck with the superiority of this *polydactylum* over all other crested forms of *angulare*, I sowed it freely with other forms, but keeping a record. Without expecting a cross I sowed it with the cruciate form of *angulare* before mentioned (*Wakeleyanum*), and I got two plants of a *polydactylous cruciatum*. I sowed it with *multilobum ovale*, and got four plants of *polydactylum* with pinnales divided in exactly the same way as *multilobum ovale*; and I sowed it with *inaequale variegatum*—the result being five plants of a character so marked as to be conclusive. Convinced at last of the reality of crossing, I sowed in faith; and as Mr. Fox and Mr. Carbonell followed on the same lines, there is now hardly a distinct form of *angulare* that is not *polydactylous*; there are now *polydactylous divisilobes*, there are *frondose* and *decomposite forms*; forms, also, of *lineare*, *congestum* and *flexuosum* all *polydactylous*. Mr. Fox's most marked success was, perhaps, his *polydactylous congestum*, of which he raised many plants; but his cross of *Athyrium F.-f. reflexum* with *Craigii* is not less marked. Mr. Carbonell's crosses between *P. ang. divisilobum* of Padley, and *grandiceps*, *Moly*, and crosses between *polydactylum* of Padley and other forms, are well worthy of note.

It is, I think, now perfectly clear, that it only requires patience and ordinary skill to effect endless crosses between almost every species, for there is hardly a species of British Fern in which there are not now sufficient varieties to begin with, and there are several species in which an addition to the existing varieties would well repay any exertion—for instance, in *Osmunda regalis* *Pteris aquilina* and *Lastrea recurva*. On the other hand care should be taken to discriminate between what are really new varieties and mere trifling differences, and this partly from a sense of justice to others and partly to prevent flooding collections with interminable repetitions. The practice of raising from well known forms and putting in a claim for the general result is as little to be defended on grounds of logic as of morality. Surely there should be a generous rivalry between all engaged in such a pursuit to accord to others what is their due.

HOW TO EFFECT A CROSS.

It only remains to give a few hints how to ensure the greatest chance of success in crossing. It is clear that the closer the juxtaposition of the prothalli the greater the chance of the antherozoids from one prothallus straying on to another, therefore thick sowing is a consideration; but as thick sowing is a fruitful cause of an unhealthy state of the prothalli (which is generally the destruction of the whole), extreme care should be taken to ensure healthy conditions in every respect. And first perhaps in importance is it that spores only should be sown: for this purpose it is best to have an abundance of spores and so to manipulate them as to sift them well with care and the skill which comes easily with a little practice, and this can be done so that practically only spores remain. But even more important than that is it that the spores, which it is intended to cross, should have come to maturity about the same time; for it is well known that spores that have been gathered some time do not germinate so soon as those that have recently dropped, and of course, unless the prothalli are fit for fertilisation at the same time the whole chance of crossing is lost.

Other probable aids to crossing may be a judicious watering overhead just at the right time, and possibly it may be a further help either to sow on an incline, or afterwards to tilt the seed-pan. I have only, in conclusion, to add, that where so much is necessarily dependent on chance, one must not be too sanguine; with care, however, and perseverance, results are certain to follow in due course. *A. M. Jones, Clifton.*

ROSES.

THE MASSING OF ROSES.

SYMPATHISING fully with "Rosa's" main contention on p. 362, it is not necessary to stop to inquire how, if the terms group and mass are not synonymous, "by a group we mean a mass"!—but some of the unaccountable omissions and recommendations of sundry Roses in the list of varieties selected for massing cannot pass unchallenged. Taking the classes and names *seriatim*, although Fellenberg is given twice over, a conspicuous omission is made among the Bourbons in not mentioning Rev. H. H. D'Ombraïn, a most valuable variety, fine in form and colour, early blooming and perpetual, very hardy and fragrant, and which might probably well replace Souvenir du Baron de Rothschild. Among the Noisettes, again, Triomphe de Rennes in most localities is too tender and not free enough to be valuable, and is not wanted with Caroline Kuster; while no mention is made of the unique and delightful Ophirie, nor of Rêve d'Or.

To be able to describe Pierre Guillot as a "vigorous-growing Rose," "Rosa" must have an easy conscience or an extraordinary climate; and Madame Etienne Levet has such little sparse foliage, and its flowers, although bright in colour, are so constantly malformed, that it is of little value. Moreover, to include Her Majesty among the hybrid Teas is unnecessary and confusing; and W. F. Bennett is absolutely useless out-of-doors.

Of Belle de Bordeaux it may be said that it lacks brightness, freedom, and fragrance; Adam is generally better under glass than outside, and might well be replaced by Madame Lambard; and if a "dash of crimson among the Teas" be wanted, there should be grown Souvenir de Thérèse Levet and Princesse de Sagan rather than Duchess of Edinburgh, which, though very pretty, is hardly more than an improved pink China. Alba rosea (which should be called Madame Bravy) may be objected to as ineffective, on account of its pendulous flowers, Devonians as lacking vigour and freedom, Etoile de Lyon as in many localities refusing to expand, Letty Coles as lacking vigour, freedom, and refinement; Marie Sisley is a charming Rose, but not very free or effective in the garden, any more than Souvenir de David. Madame Lalort is not very well or generally known; perhaps "Rosa" will kindly describe it, and give its date and raiser.

Of the above, Devonians might be replaced by the Hon. Edith Gifford, Etoile de Lyon by Perle des Jardins, Marie Sisley by Souvenir de Gabrielle Drevet, with the addition of Jean Ducher and Franciscia Krüger.

Of white hybrid perpetuals, Madame Lacharme is not easy to do well, and is in many seasons impossible; but for effect in the garden Gloire Lyonnaise replaces it to admiration, and Violette Bouyer is the best of all white hybrid perpetuals, and is not Merveille de Lyon worth growing?

Beauty of Waltham lacks brightness, and its somewhat pendulous habit is against it; Crimson Bedder is useless, being a poor grower, getting smothered with mildew, and its flat flowers lacking all form and refinement; John Bright is brilliant enough, but, like his namesake, is far too retired, and is practically never seen in autumn; while Star of Waltham, a magnificent Rose at its best, is neither free growing enough nor sufficiently constant to make a reliable and effective group in the garden. Duc de Cazes has long been worthless; Duke of Wellington, though exquisite, lacks vigour; and

Felix Genero has in its flowers about as much "dark crimson" as an ordinary roofing slate, being, in fact, with its rotund blossoms, of a dingy muddy greyish-pink colour—about as ugly a Rose as the world has ever yet seen.

Boieldieu, though fine at its best, is none too free, does not always get sunshine enough to open it, and is sometimes coarse; Madame Charles Crapelet is a lovely Rose, but lacking in vigour and hardness, as may be said of Victor Verdier; and Penelope Mayo is too small and neither sufficiently vigorous nor distinct to be worth growing. "Rosa's" arrangement of colours is a little puzzling, but the omission of Ulrich Brunner, the most magnificent Rose of its colour, of the indispensable General Jacqueminot, and of Glory of Cheshunt, appears quite unaccountable.

The Rev. J. B. M. Camm is a pretty Rose, but lacking vigour, endurance, and distinctness of colour, and it might well be replaced by the ever-blooming Grace Darling. Abel Grand should give way to the peerless Madame Gabriel Luizet; and Anna Alexieff, Anna de Diesbach, Julie Touvais, Heinrich Schultheis, Henri Ledechaux, not to mention Charles Lamb and Garden Favourite, would all of them eclipse five of the other rose-coloured Roses recommended by "Rosa." Of the blush Roses, the objection to Comtesse de Serenye is that it is rarely fit to see until late autumn; Mrs. Rivers is an insignificant little Rose, lacking vigour, size, and freshness; Madame Vidot, though beautiful when obtainable, is entirely lacking in constitution; and Thyra Hammerich is of no value where Baroness Rothschild can be grown.

There are two groups of Roses not referred to at all by "Rosa," namely, the miniature but prolific Polyantha Roses and the Austrian Briars; yet the former afford the most splendid masses of bloom throughout the whole season, two of the best varieties being the pink Mignonette and the pure white Pâquerette; while the Austrian Briars, though not autumnal, are so unique and striking in colour whether the single or the double forms be employed, that they constitute some of the most valuable material available in the massing of Roses. *Theta.*

ROSE MADAME FRANÇOIS JANIN

is a general favourite with every one who has had the pleasure of seeing it at Lord Brassey's, Normanhurst, Battle, growing on the back wall of the Rose-house, where it has been growing for the last twelve years, covering a space about 16 feet by 12 feet high, with a crop of nearly 2000 buds of a lovely apricot colour, the bulk of which are produced in trusses of fours and fives, as you will see from the enclosed, which Mr. Allen cut on Wednesday morning, April 4. As I have witnessed this Rose for several years it seems to produce the same abundant crop every year, and seems in every way superior to Wm. Allen Richardson, both of which are growing side by side in the same border, the latter only producing flowers singly, and not so rich in colour. *J. D.* [This note was accompanied by a specimen cut on Wednesday, but which, from various circumstances, did not reach us till the Saturday night following, when it was taken out and put into water, and shortly recovered itself so as to make us able to endorse all that our correspondent says in its praise. Since this was written we have received fresh specimens of this lovely free-flowering Tea Rose direct from Mr. Allen. It was sent out by Levet in 1872, and has pale orange-apricot flowers, beautiful alike in bud and when full-blown. We hope to hear from Mr. Allen some particulars as to his method of culture, which is evidently so successful. *Ed.*]

NEW HYBRID ROSE, MADAME G. BAUANT.

Having informed the raiser of the above-named new Rose of the doubts expressed as to its being really a hybrid at all, or anything else but a seedling white Tea Rose, expressed by your correspondent "Wild Rose," in a note appearing on p. 310 of your issue for March 10, he writes me that he thinks your correspondent cannot have seen the growing plant or

its vigorous and extremely thorny wood, or he would have no doubt of its being a hybrid, and partaking largely of the nature and appearance of its maternal parent—*Rosa rugosa*. In further proof of its being a true hybrid Monsieur Bruant states that his new Rose is invariably sterile, as very many hybrids usually are; and also that the flower, though closely resembling that of a Tea Rose, is not exactly similar to anything known to him. It is to be hoped that when this interesting novelty blooms during the coming summer—as it may be expected to do in the gardens of many readers and correspondents of the *Gardeners' Chronicle*—that these doubts and uncertainties will be set completely at rest. *W. E. G.*

NEGLECTED ROSES.

I have read with much interest the remarks of "Wild Rose" and other correspondents on the subject of Roses, whether they are or are not neglected, as the matter carries me back to bygone days and to varieties which then used to figure in the winning stands at Rose shows, some of them helping to gain honours for myself. I have looked out for one which has not been mentioned, viz., Souvenir de Monceau, which, although a good Rose, is not to be found in catalogues [It is in the *Dictionnaire des Roses*], unless under some other name. It is H.P. in the strictest sense of the word, being about the first to begin to bloom and the last to finish, and in favourable seasons I have cut fine buds at nearly the end of the year. If "Wild Rose" can give me any information on this point it will be very acceptable. The plant has smooth wood, and in style and colour the bloom resembles Alfred Colomb or Senateur Vaisse, but is not so bright. The scent is, to my mind, such as a good Rose ought to possess, but which many are deficient in. I first saw the Rose about 1860, as nearly as I can recollect; at that time it was thought to be a grand Rose. I have grown it ever since, and I still have the original plant. *W. Divers, The Gardens, Winton Place, Maidstone.*

While it is very desirable that Roses which have the merits of hardness, vigour, freedom of bloom, and brightness of colour, should not be neglected because they lack the perfect form of modern varieties, it is equally desirable that Roses should not be recommended merely because they are old. Nevertheless, "F. P." in endeavouring to supplement (on p. 362) "Wild Rose's" carefully selected list of neglected Roses, hardly seems to have borne this in mind, for it is neither possible nor desirable to re-instate in public favour a Rose like Géant des Batailles, for instance, which, though of immense historical interest to the rosarian, is of no value nowadays to the general grower, on account of its being the reverse of vigorous, a perfect victim to mildew, not very bright or distinct in colour, and lacking form and freedom. Most of the same objections apply to Mrs. Rivers, which has small round flowers of a dingy slaty-white colour. Neither Pio Nono nor William Griffiths would be likely to find much favour with rosarians who had grown the modern varieties that have superseded them in their respective colours; and Duchess of Norfolk, though fresh-coloured, is neither very double nor free; Bourbon Queen can hardly be called "neglected," while the Boursault approaches more nearly to dreary insipidity than any other Rose.

It is inconceivable that any of "F. P.'s" selection should be planted in a collection that was to consist of not more than fifty plants; and probably, as far as ninety-nine out of every hundred Rose growers are concerned, not one but all the varieties enumerated, with two or three exceptions, "might cut" if only they would never "come again." *Theta.*

[We quite endorse our correspondent's views. *Ed.*]

ROSE SHOWS IN 1888.—In addition to those announced at pp. 306, 330, there are the following, kindly sent by Mr. Edward Mawley:—July 4, Hitchin; Tuesday, July 10, Tunbridge Wells; Thursday, July 12, Birmingham, Carlton-in-Workshop, and Oxford; Saturday, July 14, Gloucester (the date of this show is not yet definitely fixed); Monday, July 16, Newcastle-under-Lyne; Tuesday, July 24, Tibshelf.

EUCALYPTUS URNIGERA.*

From time to time we have published in these columns illustrations of those Eucalypti which may be considered fairly hardy in this country; we have now the pleasure, thanks to the kindness of Mr. J. Garret, the gardener, Whittinghame, Prestonkirk, East Lothian, Scotland, of figuring a species which we think may fairly claim to be the hardiest of any. It is a species which, in its immature state, has been confounded with *E. Gunnii*, but differs from it in the form of the fruit. *E. urnigera* is a native of the summits of the Tasmanian mountains, where, according to Sir Joseph Hooker, it forms a small tree 15–20 feet in height.

The specimens forwarded to us have slender twiggy branchlets spreading at an angle of about 50°, covered with smooth olive-green bark. The alternate leaves measure about 5 inches in length by three-quarters of an inch in breadth, and are uniform, coriaceous, narrow, lanceolate, somewhat curved, dull green on both surfaces, with a prominent midrib, and faintly crenulate margins. The leaf-stalks are about 1-inch long, slender and compressed. The flower-stalks are less than half an inch long, and bear a three-flowered cyme, or (by abortion) only a single flower raised on a short pedicel. The buds are pyriform, with a small conical peaked calyx. The fruit measures about half an inch in length, is cylindrical, narrowed at the neck, slightly expanded at the top.

We suspect the tree now figured (fig. 65) is the one alluded to by Rev. D. Landsborough in the *Trans. Bot. Edinburgh*, 1887, p. 21, under the name of *E. Gunnii*, which he says is now more than 60 feet high in spite of having been cut to the ground by frost in 1860. Seedlings from this tree have been raised in the Edinburgh Botanic Garden by Mr. Lindsay.

Of *E. urnigera* Baron von Mueller says:—"It is particularly hardy, and may become of sanitary importance to colder countries in malarial regions, the foliage being much imbued with antiseptic oil; greatest height 150 feet, circumference 18 feet."

The figure in the *Flora Tasmania* is so similar to our present plant that it might have been taken from the same specimen. The leaves, however, in the native state are variable in character, ranging from broadly ovate to linear, and with a small deciduous spine at the apex; and those who know most about the plants in question are the most chary in giving an opinion as to their identity. Baron von Mueller even speaks of specimens which form a transition between this and the very different looking *E. cordata*.

FLOWERS AT PANSHANGER.

BEAUMONTIA GRANDIFLORA.—This beautiful plant is in great beauty on the roof of the Banana-house in the gardens of the Right Hon. Earl Cowper, where, under the skilful management of Mr. R. Ruffett, it has caused an increasing amount of attraction for the last five years or so, and at present forms one of the most charming of floral displays with its upwards of 5000 flowers, like immense white Gloxinias. The flowers are borne on stout woody lateral growths, and in clusters of from fifty to 150 together, each cluster forming, as it were, a bouquet which is kept fresh for a considerable time by constant successions of flowers from buds on the truss. It is a sight well worth a journey to Panshanger. [In our issue for May 8, 1886, a full page illustration, taken from this plant, was published. Ed.] Other climbers on the roof or round the sides of this house (which may be called a warm greenhouse), now in bloom are *Passiflora racemosa* with long racemes of red flowers, *Stigmaphyllon ciliatum*, whose flowers at a distance much resemble those of a yellow *Oncidium*; *Combretum purpureum*, one of the finest of climbers, with dense heads of blood-red flowers; the favourite blue and white *Thunbergia Harrisoni*, the white

Dipladenia boliviana and other *Dipladenias*: *Clerodendron Balfourianum*, &c., the whole making a fine effect. There were also the scarlet *Euphorbia Jacquiniflora*, the Gardenia-like *Tabernaemontana*,

Cut flowers here, as in most other large places now, are much worked for, and the well-filled and orderly-kept houses give ample testimony that Mr. R. Ruffett is an adept at the work. Among the Orchids in bloom are *Vanda suavis*, *Dendrobium Dalhousianum*, *D. chrysotoxum*, *D. fimbriatum*, *D. f. oculatum*, and several species of *Oncidium* and *Cypripedium*. The Azalea-house, too, is well furnished with flowers, and made all the more attractive in that the white, pink, and red colours of *A. indica* are varied by the exquisite yellow, buff, and copper-coloured tints of *A. mollis*.

A well-bloomed batch of *Amaryllis* contains many good varieties, but they only serve to show up the excellence of *Empress of India* (Veitch), the largest specimen of which has eight flowers, massive, dark scarlet, with a white star in the centre. Other bulbous plants in bloom are some fine pots of the pretty *Veltheimia viridifolia*, of *Freesia refracta* and *alba*, *Sprekelia formosissima*, *Eucharis Sanderiana*, and the usual bulbs grown for flower at this season. Among the other good batches in flower or bud are some excellent *Cliveas*, *Crassula jasminae*, Cape and other *Pelargoniums*, &c. Ferns are also well represented, and the walls of the Pine pits, which are densely clad with *Adiantum Capillus-veneris* show our old friend in its most charming aspect.

Decorative plants in thumb-pots are a noteworthy feature with Mr. Ruffett, who grows for indoor decoration all kinds of suitable plants in the smallest pots, a constant succession being kept up, so that each may be thrown away when once used. For this purpose *Crotons*, *Fittonias*, *Cyrtodeiras*, *Dracenas*, *Ferns*, *Acalyphas*, *Coleus*, *Panicum variegatum*, and many others are employed, and it is found much easier to maintain a supply of young, stock than to trouble with the plants which have been damaged by use. Outdoors things here are as elsewhere backward, but yet there is a pleasing show of colour with *Crocuses*, *Chionodoxa Luciliae*, *Scilla bifolia*, *S. sibirica*, *Erythroniums*, &c., and many other hardy flowers, which only await more genial weather to burst into bloom. *J. O'B.*

FOREIGN CORRESPONDENCE.

TERRACE PLANTING ON THE GENOESE RIVIERA.

THE ROOT RESPIRATION OF PLANTS AND TREES.—I have been carrying out horticultural experiments for the last quarter of a century, in winter, in my rock garden near Mentone, and have only recently discovered that I have all along been making a great mistake. I have spent hundreds of pounds in making masonry walls to support the mountain terraces, to contain the soil laboriously collected behind them, not recognising the fact that these masonry walls interfere with the respiration of the plants and trees by their roots. Thus, they arrest and stunt their growth, instead of favouring it. This important fact finds its applianee, I believe, at home, as well as on the shores of the Mediterranean. Are not plants and trees planted in conservatory borders surrounded with cemented walls like plants in glazed pots, placed in unfavourable vital conditions? [Yes, decidedly.]

In every region of the Mediterranean the rocks and mountains are terraced by walls built of rough stones, without mortar or cement. The Olive trees, and all other trees and shrubs, are planted in a sparse soil behind these rubble walls, where they thrive. The Olive trees more especially form cartloads of ligneous roots behind these dry walls. After the heavy rains of autumn and spring, above all, if the terraces behind them have been deeply trenched, these rubble walls frequently fall, and thus put the owners to great expense. This has often occurred to me because I trenched my rocky terraces as deeply as I could. So I early determined to put a stop to such dilapidations by replacing every rubble wall that fell by a strong thick masonry one. I merely made drainage holes at the bottom, and sometimes not even that, trusting to the rock crevices for drainage. As years have passed on I have discovered that the

FIG. 64.—EUCALYPTUS URNIGERA FROM WHITTINGHAME, SCOTLAND: REAL SIZE: FLOWERS PALE YELLOW.

and different varieties of *Begonia nitida*; a fine bush of *Psychotria jasminiflora*, covered with white flowers, and some magnificently grown *Eucharis amazonica*, which, with other flowering and foliage plants occupying the body of the house, complete the display.

* *Eucalyptus urnigera*, Hook. fil., *Lond. Journ. of Botany*, vi., 477; *Flora Tasmaniae*, i., p. 134; Baron von Mueller, *Eucalyptographia* (*E. Interleptophloia*).

trees and shrubs planted behind these walls attain a certain development, and then cease to grow. This arrest in development takes place often, if not generally, although they are apparently in the most favourable condition. They have more soil and more moisture than others planted in more unfavourable conditions in but little soil, behind crumbling broken walls, scorched and dried by the sun. Yet these latter thrive best. This observation forced itself upon me in every part of my seven-acre mountain domain.

What is the reason? Once the observation

morial, quite independently of the cost question. I have a Palm, a *Phoenix dactylifera*, planted twenty years ago which has become a large tree, with a trunk 6 feet in circumference, and which bears farinaceous Dates that ripen every year. It is one in a row of ten planted the same week, not one of which is one-tenth of the size. I was long perplexed at the extraordinary difference, until one day my gardener found the Palm roots in the tank of a conservatory 15 feet below, on the other side of a masonry wall 3 feet thick. The roots had forced a passage underneath the wall, and entered the reser-

No doubt the exuberant vitality and great size of trees planted on the slopes of mountains in all parts of the world is greatly due to this cause—to the roots being able to breathe, owing to their exposure to the air. I have lately had a very interesting illustration of the way the roots of trees planted on the level, and that usually keep near to the surface, develop themselves if they can reach the air. I have made a rockery over a bank about 10 feet high on a slight slope, beginning at the edge of a terrace planted with Orange and Lemon trees. I had occasion to remove a Lemon tree planted above the rockery from this terrace, and also to remake the rockery. I found the Lemon tree had passed roots 10 feet long or deep in the soil immediately behind the rockery. Lemon and Oranges planted here on the level do not descend more than 2 or 3 feet from the surface. But finding air to breathe behind the rockery the roots had gradually descended to the water level. Consequently the tree was most flourishing.

At this present moment my gardeners are manuring the Lemon and Orange trees according to the traditions of the country, and in a way that strongly corroborates this view. A trench is dug about 1 foot deep and 2 or 3 feet broad at a distance of 1, 2, or 3 feet from the trunk of the tree according to age and size, dividing the surface-roots only. In this trench is placed the manure: the best for these trees is considered to be horse-hoof parings. From 8 to 12 lb. are given to each tree according to age and size, say, 10 lb. to a twenty-year-old tree. To this is added stable-manure. The hoof-parings are first spread out in the trench, the stable-manure spread over, and the earth is then thrown in, and firmly pressed down. A good watering follows. In summer a saucer is made round the foot of the tree during the time of artificial irrigation. Before this saucer is made, the depth of soil over the manure is not more than 10 or 12 inches when the saucer is made there is not more than 6 or 8 inches. Thus the new roots are enticed up to the surface and breathe freely, on the level, just as mountain plants breathe on the sloping precipitous surface. Enlightened by experience and reflection I mean to break up most of my masonry walls, and riddle them with breathing holes.

I may remark that this Southern mode of treating fruit trees admits of application everywhere, especially in poor sandy soils. At my Weybridge garden (Bagshot sand), I had many Pear and other fruit trees perfectly healthy, that flowered every year but without any result. The fruit either did not set, or fell. I adopted the Riviera Lemon tree plan, and had a good crop of fruit the first year. I found the roots straggling about in all directions in the sandy soil far beyond the reach of the manure applied in the usual way.

At Weybridge I had an orchard-house, 50 by 30 feet, for Grapes and Peaches, with a large central bed, and side beds all round—I found, as I believe every one else does, that the Vines did best planted out in Vine borders, and introduced into the house. The Vines planted in the beds inside never did well, or at least never produced such good Grapes, or in abundance, as did those planted outside. The Peach trees also planted out in these inside beds did not satisfy me; the quality was good, but the quantity generally deficient. May not the cause have been deficient root-respiration owing to the beds being confined in cemented brick walls? May not this be an universal error in the formation of beds and border inside conservatories and orchard-houses? Ought not these beds to be built at least 2 feet from the surface, with rubble or with corks, so disposed as to leave large orifices, one-half or one-third of the area, for root respiration?

I have here, at Grimaldi, a conservatory with a large central bed, meant for choice Roses, intended to flower between the middle of February and the end of March—one short season with Roses, but they have never succeeded. May not the cause be the masonry walls, Roman cemented, that contain the border, and entirely prevent the deeper roots breath-

FIG. 65.—EUCALYPTUS URNIGERA AT WHITTINGHAME GARDENS, PRESTONKIRK. (SEE P. 460.)

made I had only to look round me to find the explanation, and I am very angry with myself for not having seen the physiological facts of the case sooner.

In all mountain regions, and wherever mountains or rocks are terraced for the planting of trees and shrubs, the roots have free access to the atmosphere in their entire extent. They no doubt breathe by their roots on the slopes of the mountain sides, or through the large crevices in the rubble walls. The natives of these regions never seem to plant behind masonry walls. I thought that it was principally on account of the heavy expense; but I now believe that it is a cultural tradition, brought down from time imme-

voir, thus getting water *ad libitum*, and, I doubt not, air also. The Arabs say that for a Palm to flourish it must have its roots in the water and its head in the flames. This saying is verified in my case, for the summer sun is very hot at Mentone, and the Palm has his roots in the water. Several of my neighbours, inspired by this proof of the correctness of the Arab proverb, have made artificial lakes or ponds, and planted Palms on the margin, with a marvellous result; their growth has been nearly if not quite as rapid as it would have been in the West Indies. The *Phoenix canariensis* more especially seems to do well in our climate under these conditions, making a wonderfully rapid growth.

log? Does not too deep planting act in this way? I am having this wall taken down to a depth of 2 feet, and replaced by a brick wall fenestrated, so as to leave nearly one-half the area open. I mean water to trickle down the sides from these openings when the bed is watered, and thus to let air enter everywhere and permeate the earth, as on the mountain side. If I succeed, and my Roses grow fast, it will be to me, and perhaps to many others, a new light in conservatory building and treatment. *Henry Bennet, M.D., Torre di Grimaldi, Ventimiglia, March 20.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT BURFORD LODGE.

NOTWITHSTANDING that Sir Trevor Lawrence's grand collection includes almost everything that is new, beautiful, or curious, and consequently embraces many plants of whose culture little is known, as well as many whose department under cultivation has gained for them the name of bad doers, the Burford Orchids, perhaps, never looked better of late years than they do at the present time. Many new or rare species are now in bloom—indeed, it is not easy to visit the collection when such is not the case; and among the most striking is *Lissochilus giganteus*, a new plant of noble habit, and well deserving its specific name. Its leaves are entire and plicate, like those of a *Curculigo*, and its flower-spike, which is as thick as one's finger, is about 8 feet in height, bearing on the upper portion some fifteen large rose-pink flowers of great beauty; roughly speaking, they bear a resemblance to large flowers of *Cattleya Harrisoniae*, and have the same firm, wax-like texture. The plant appears to be a good grower, and that adds much to its value. Round it are grouped other species of *Lissochilus*, *Eulophia*, *Spathoglottis*, and plants of a similar nature, among which a fine head of flowers of *Spathoglottis Kimballiana*, which looks like a bright yellow *Phalaenopsis*, is prominent; *S. plicata* is also flowering, and *Phaius Blumei* and a fine many-spiked plant of *P. Wallichii*, which is a noble object when well bloomed. *Catasetum* are also represented in this house by *C. medium*, with about three dozen flowers in a spike. It has a beautifully white-fringed labelum, and comes near to *C. cristatum*; and *C. Gnomus*, a most weird-looking object, and beautiful withal. *Bulbophyllum* and *Cirrhopetalum* are here in force too, the pretty *B. auricomum* and *Cirrhopetalum picturatum* being in bloom, as well as *Scuticaria Hadweni* and the rare and curious *Trichoglottis fasciata*.

The *Cypripedium* and *Selenipedium* are specialties here, where many new cross-bred varieties, raised there and not yet bloomed, are being nursed, as well as most of the rarer kinds, such as *C. Stonei platycorium*, the hybrids of *C. venustum*, which were spoken of slightly by many when they first flowered, here exhibit beauties which tell of good culture; *C. Mearesianum* × is a grand flower, *C. Williamsianum* ×, a fine large light-coloured variety; *C. politum* ×, and other *venustum* crosses very attractive, all having a peculiar shiny Indian-yellow tinge over them. Fine examples of *C. vexillarium* ×, *C. vernixium* ×, *C. Swanianum superbum* ×, *C. Bullenianum*, *C. Druryi*, *C. hirsutissimum*, *C. grande* ×, *C. Dayanum*, *C. barbatum biflorum* (with fifteen flowers), *C. Argus*, *C. lavigatum*, *C. ciliolare*, *C. callosum*, and *C. niveum* are in bloom, as well as several of the *Sedeniform Selenipedium*, the most chaste and beautiful of which is the fine *S. leucorrhodum*, with its delicate pearl or blush flowers; indeed, it is difficult to imagine anything more beautiful in its section.

In the warm-houses are some rare *Aogracum*s and *Aërides*, *Calanthe nivalis*, *Vanda cœrulescens*, *Phalaenopsis Luddemanniana*, a fine batch of *Odontoglossum Roezlii*, some fine masses of *Dendrobium Jenkinsoni*, *D. aggregatum majus*, *D. Smilliae*, *D. chrysotoxum*, *D. fimbriatum oculatum*, *D. crassinode superbum*, *D. Veitchianum*, *D. superbum*, *D.*

luteolum, *D. crepidatum*, and *D. Findlayannum*; and among the *Epidendrum*s, which are well looked after, and prove worthy of it, are the perennial-flowering and handsome *E. Wallisii*, *E. pseudopendulum*, *E. arachnoglottum*, *E. Stamfordianum*, *E. cnemidrophorum*, *E. nocturaum*, *Schomburgkia tibicinis*, and *S. marginata*.

Other noteworthy plants in the intermediate-houses were a finely flowered specimen of *Arpophyllum giganteum*, several of the beautiful old *Lycaste Harrisoniae*, *L. fulvescens*, several good *L. Skinneri*, a fine specimen of *Trichopilia snavis alba*, a nice batch of *Dendrobium Jamesianum*, *Cattleya maxima*, *C. Lawrenceana*, *C. Mossie delicata*, *Lælia cinnabarina*, *L. elegans*, some *Cœlogyne*s and *Cymbidium*s, and the pretty fragrant *Maxillaria Turneri*, with scores of white and yellow flowers.

The cool-houses are beginning their show of *Odontoglossum*s, and with others the rare *O. miniatum* in bloom, as well as some fine hybrids of the *Andersonianum* type; and the *Masdevallias* are making a good show with the varieties of *M. Harryana*, *M. Lindeni*, *M. ignea*, *M. Chelsooi* ×, *M. Fraseri* ×, and *M. Veitchii*, the variety *gigantea* of the last-named being very ornate. The *Chimera* section, too, which are here so well grown, suspended overhead, present numbers of their quaint flowers on *M. chimera*, *M. Bella*, *M. nycteria*, *M. radiosa*, *M. Chestertoni*, and others of that section; while the smaller-growing species have many pretty and curious things in bloom, and notably the rare *M. pulvinaria*, *M. racemosa*, *M. ludibunda*, *M. Wageneri*, *M. xanthina*, and that prettiest of all small-growing *Masdevallias*, *M. Shuttleworthii*. Several specimens of the now rare *Oncidium bifolium* are also in bloom, *Pleione humilis tricolor*, many *Odontoglossum Rossi majus* and *Cervantesi*, *O. nebulosum pardinum*, *O. ramosissimum*, *O. pulchellum majus*, *O. Edwardii*, *Ada aurantiaca*, and some *Sophranitis*, *Stelis muscifera*, a very curious plant; *Oncidium incurvum*, with over fifty spikes; *O. leucobulum*, &c.; and among *Orchid* associates the handsome blue *Utricularia longifolia*, *U. montana*, and the rosy *Pinguicula cordata*.

In one of the cool intermediate houses it is worthy of remark that the *Miltonias*, which puzzle so many to grow successfully, are doing well on rafts with a little peat and sphagnum, and placed horizontally on pots on the side stages. Mr. Bickerstaffe says they have improved rapidly since they have been so grown, and some of the lesser *Cœlogyne*s, and especially *C. Schilleriana*, also like that mode of culture. In the other houses are the fine display of all the scarlet *Anthurium*s. The elegant arrangement of white and rose varieties of *Begonia nitida*, with crimson *Impatiens Hawkeri*, and the other attractive displays which the culture at Burford Lodge has now led us to expect there in their season.

CŒLOGYNE CRISTATA, MOUNTAIN FORM.

In January of 1886 Mr. Duthie, of Sabarnpore, sent to Kew some plants of a *Cœlogyne* which had been found by his head gardener "on some rocks above our new hill garden at Arnigadh. The elevation is a little over 5000 feet. My gardener suggests that it should be kept in a dry greenhouse during winter. It will stand a few degrees of frost. In the summer it would require warm greenhouse temperature and plenty of water." The plants arrived at Kew in good health, and were compact masses of pseudobulbs, varying in size from half an inch to 1½ inch in length. The leaves were in pairs, 4 inches long by three-eighths of an inch wide. We had nothing like these plants at Kew, and certainly we did not imagine them to be *C. cristata*. However, they flowered for the first time from bulbs 2 inches long, egg-shaped, and leaves 9 inches long by three-quarters of an inch wide. It seems likely that, under the same treatment as is given to ordinary *C. cristata*, these mountain plants will revert to the ordinary form in respect of bulbs and leaves. But there is a difference in the flowers, too—those of the mountain plants having broad plain (not crisped or curled) sepals and petals, and the colour of the keels in the lip is almost orange-yellow; the substance of the flowers, too, is better than in the ordinary

form. It is difficult to convey an idea of the difference in words, but a comparison of the two shows it at once. Is this new one the variety known as *C. cristata* var. *major* or *maxima*? *W. Watson, Kew.*

ANTHURIUM CHAMBERLAINI.*

A SHORT time since Mr. Cooper, gr. to the Right Hon. J. Chamberlain, M.P., of Highbury, Birmingham, was good enough to forward us specimens of a magnificent Aroid, with huge heart-shaped leaves and sumptuously coloured boat-shaped flower-sheath (spathe) and flower-spike (spadix) (fig. 67). The plant in question grows on the rocks in the fernery at Highbury in a temperature averaging 55°, and is one of the greatest ornaments of the house. The roots, according to Mr. Cooper, are "about the thickness of the little finger, and run about over the rocks." The plant was introduced with some imported *Cattleya Gaskelliana*—a circumstance which leads to the inference that the Aroid is of Venezuelan nativity. In any case it is one of the noblest species in a genus already rich in superb species, and is handsome alike in foliage and in flower. After consultation with Mr. N. E. Brown, who has a special knowledge of these plants, both in a cultivated form and as herbarium specimens, we have arrived at the conclusion that the species is a hitherto undescribed one. Under the circumstances, it is appropriate to dedicate it to the eminent statesman of whose establishment it forms so conspicuous an ornament. As a species it is near to *A. formosum* of Schott, and to *A. bogotense* of the same botanist, but is simply distinct from either. Its technical characters may be noted as follows:—

The huge leaves are borne on stalks as thick as the little finger, about 48 inches long, slightly channelled on the upper surface above, elsewhere cylindrical. At the top of the stalk is a swelling or "geniculus," about 2½ inches long, and which is no doubt concerned in the movements of the leaf according to the direction of the sun. The blade of the leaf is coriaceous, glabrous, shining green above, paler beneath, some 3 feet in length by 2 feet in width, cordiform, ovate-lanceolate, the two basal lobes rounded, widely separated one from the other by a sinus or interspace about 8 inches in depth, and 6 inches across. The larger ribs are prominent on both surfaces, and comprise a midrib, from either side of which are given off at intervals of about 2 inches more or less, seven to eight pairs of ribs which curve out gradually till they reach nearly to the margin, where they bend sharply towards the point of the leaf, running parallel with the margin for some distance, and then uniting and becoming continuous with other ribs, so as to form one continuous intra-marginal rib. From either side of the base of the midrib diverge two ribs, which occupy the centre of the blade of the leaf between the midrib and the margin. On the outer side of these are the basal nerves proper, nine or ten in number, curving round into the basal lobes, and arranged in a pedate or sympodial fashion, the base of the curved synpode having no laminar tissue on its concavity next the sinus, but only on the convex side. All these larger ribs communicate directly or indirectly with the intra-marginal rib above mentioned, and the interspaces are filled in with a somewhat obscure mesh of rather large polygonal net-like spathes.

The peduncle is a foot or more long, terete,

* *Anthurium Chamberlaini*, Mast., n. sp. (fig. 67, p. 465).—Folius longe petiolatis pergandibus, petiolis, 1.22 cm. basi tantum parum sulcatis, apice geniculis crasso 6.7 cm. longo instructo, lamina sub-metralibus, diametro 82 cm. coriaceis glabris, superne nitentibus pallide virentibus, late cordato-ovatis acutis, lobis rotundatis sinu lato profundo separatis, costis prominentibus, costa mediana utrinque 16–18 pinnatis divisa, costis secundariis remotiusculis, costis basalibus 9–10 divergentibus curvat s pedatis sympodiolum efformantibus, sympodio curvato latere concavo nudo, i.e. lamina destituta, costis primariis omnibus arcuatis versus marginem in costam intra marginalem confluentibus; pedunculo tereti; spathe 20 cm. long. 10 cm. lat. coriacea scaphiformi basi aperta apice marginibus parum involutis cuspidata, extus pallide punicea intus nitide intenseque coccinea; spadice basi stipite eburneo tereti 1–2 cm. long. e, spathe libero, sublevato, 15 cm. long. 2 cm. lat. tereti-fusiformi obtuso arcuato, intense velutino-purpureo; floribus generis.—Patr. Venezuela? In hort. honoratissimi Josephi Chamberlaini, in rebus publicis scientissimae, nec non orchidearum cultoris egregii, primum detecta.

glabrous, as thick as a swan-quill, and bears at its summit a thick boat-shaped spathe, about 8-9 inches long and 4 in width. It is open at the base, and free from the spadix, convolute for a short distance beneath the pointed apex, of a pale dull puce colour externally, shining and rich deep crimson coloured internally, bordered by a very narrow line of ivory-white, edged in its turn by a narrow margin of yellow. A number of curved parallel but not very conspicuous nerves traverse the spathe from base to apex, and the inner surface is studded with minute whitish scales, hardly conspicuous, but which, no doubt, enhance the effect of the rich crimson colouring. The spadix is raised above the base of the spathe by a short ($\frac{1}{2}$ inch) ivory-white stalk, and is about 6 inches long, $\frac{3}{4}$ inch wide, cylindrical or fusiform, curved, dull reddish-velvety-purple in colour, and densely covered from base to apex with flowers of the usual structure of the genus *Anthurium*. The richly-coloured spathe and spadix act, no doubt, as invitations to insects, by whose means the flowers are fertilised. The white stigmas projecting beyond the purple segments of the flower are matured before the anthers (proterogynous), and hence cross-fertilisation is imperative. *M. T. M.*

THE FLOWER GARDEN.

DOUBLE-FLOWERED PYRETHRUMS.—These deservedly popular flowers are second to none of the occupants of the herbaceous borders in usefulness as cut blooms, possessing, as they do, the property of lasting fresh for a long time. The colours are very varied, ranging from the purest white to purple and maroon. Unlike most other herbaceous plants, they will not bear division and transplanting in the autumn months, and more failures to grow them may be attributed to this cause than to any other; but the present time of the year, just as they are starting into growth, is found to be the best. Although they are well adapted for mixed borders, and are very effective there, I would advise their being grown in beds by themselves. They delight in a rich, well-drained soil, which, in making new beds, should be dug to a depth of from 12 to 15 inches, incorporating a liberal dressing of manure and leaf-mould, if the staple is at all inclined to be poor, as the work proceeds, and in shallow soils the bottom spit should not be brought to the surface. The beds may be made of a width of 4 feet to 5 feet, which will afford space for three rows of plants at 2 feet in the rows and 18 inches between them. Old established roots of three or four years' growth may be lifted and cut into pieces of about 6 inches square; plants in pots at all root-bound should have the roots disentangled previous to planting. In planting, press or tread down the soil quite firmly about the plants, and finish off with a top-dressing of decayed manure. Treated thus they will flower fairly well the ensuing summer, and by the following year the blooms will be more abundant, and of good quality, approaching in size and substance well-grown Paony-flowered Asters. Old beds should be replanted every third or fourth year.

Flower Beds.—During the next two or three weeks beds occupied by spring flowering plants will be at their best, and the time will be appropriate for taking notes and arriving at definite conclusions regarding planting arrangements for another year. Changes are always welcome, providing they are well thought out beforehand, and are not too fanciful or opposed to good taste, and possess some element of originality in their conception. When two or more species are grown in the same bed, and a mass of bloom is wished for at a given time, care must be taken to select subjects which flower simultaneously; for instance, Snowdrops will go very well with *Scilla sibirica* or *Chionodoxa Lucilia*, Wall-flowers with *Violas*, *Arabis* with *Polyanthus*, &c. Use the Dutch hoe and rake on the surface of the beds of Wallflowers, hand-weed others that may require it, and all beds laid out on grass should from this time onwards be edged with the shears as often as occasion demands, and rolling and mowing the grass when necessary.

Hardy Annuals.—The general collection of these may now be sown, covering the seed slightly. In mixed borders the seed may be sown in drills about a foot across, the presence of each to be indicated by a stick. Do not be too sparing with the seed, but make due allowance for losses by small birds and slugs, not forgetting in the absence of these enemies to thin out the young plants when large enough.

Make a successional sowing of these seeds towards the end of the month.

Lawns.—Although grass is backward in growth this season mowing must soon be commenced, and machines and scythes be got in readiness without delay. Lawns, which received a winter's dressing of manure should have all refuse that may yet remain on them cleared off, and rolled afterwards. It is always advisable to have the first cutting done with the scythe, previous to which objectionable weeds should be pick'd up. Well kept lawns are, as is generally acknowledged, features of great attraction in a garden, so that no pains should be spared to keep them in condition. There are some old gardens where, through the force of circumstances, high keeping cannot be followed out, and the best advice in those cases is, to keep in good order that which is in the immediate vicinity of the mansions and flower-beds, allowing the remainder to grow uncut until the end of June, and make hay of it.

Tigridias should now be planted out. A light loamy soil with leaf-mould suits them well. If they are to be grown in beds by themselves, plant the bulbs 6 inches apart; and in mixed borders half a dozen in clumps at intervals of a few yards. These pretty Mexican bulbs ought to be grown in all gardens where climate and soil are suitable. *J. Horsfield, Heytesbury.*

FRUITS UNDER GLASS.

PEACHES AND NECTARINES.—The early trees will now have finished stoning, and the fruit will increase in size with rapidity after this date; there is therefore no longer danger of fruit dropping, and where the latter stand too thickly the final thinning may be given. The temperature may range from 60° to 65° from 10 P.M. to 6 A.M., the trees being syringed in the morning, and at shutting-up time, when 80° to 85° may be maintained for a short time. Towards the end of the month the fruit will begin to change colour. Whenever this becomes discernible, give abundance of air night and day, but less moisture. Syringing must also be discontinued, and the roots be kept in a fairly moist state. Old trees, and those which are carrying heavy crops, will be benefited by copious doses of weak manure-water.

Succession-houses.—Trees in these must have timely attention in disbudding, pinching, and tying, leaving no more shoots than are requisite for the crop next season. Endeavour to get all large stems protected by tying young shoots over them, as the sun has an injurious effect when allowed to shine with full force upon them. Keep the temperature at about 55° until the fruit is stoned, and syringe the trees twice a week with clear soot-water. Trees in late houses will benefit from the use of a little fire-heat, and take care that cold air currents do not reach the tender foliage and fruits. When all the trees have set their fruits, give them two syringings daily. Keep a sharp look-out for greenfly, fumigating on its earliest appearance. When it is intended to fumigate, see that the foliage is perfectly dry, otherwise the leaves are liable to get scorched. Frequently examine the borders to see that they are in a sufficiently moist state.

Figs.—Some of the earlier fruits will now exhibit a disposition to grow, showing that fertilisation is completed, and maturity will speedily be reached. Less syringing and a drier atmosphere are, therefore, indispensable to obtain high flavour and good finish, and without which green Figs are the most insipid of fruits. In bright weather a warmth of 75° to 80° may be afforded, and 90° after shutting up the house in the afternoon, allowing a gradual fall to 65° by the morning. Stop the stronger shoots on succession trees at the fifth or sixth leaf, and remove all weakly shoots not required for furnishing the trees. Apply warm, weak manure-water frequently, and syringe twice daily in bright weather, which will tend to keep down red-spider. Let the temperature be 55° to 60°, and 10° higher by day with sun-heat, until the trees have passed the blooming stage. The latest started house should be assisted with a little fire-heat, but if that cannot be done, shut up early in the afternoon so as to secure as much sun-heat as possible, and syringe on the mornings of fine days only.

Cherries will now be stoned, but the temperature must not be allowed to run too high, 50° to 55° being sufficient for the night, and 65° to 70° may be allowed in the day with bright sun and a sufficient amount of moisture. Keep a sharp outlook for weevils, for these pests do much damage to both fruit and foliage in a short time. The only method

of getting rid of them is hand-picking, and noting that whenever a curled leaf or web is observable there some enemy is lying. Black aphid is also very troublesome, and sometimes the green and brown. The fumes of tobacco have little effect on the first and third, and a weak solution of tobacco-water must be applied, care being taken to keep clear of the fruit; dipping the shoots is best where it can be done, but however applied it must be syringed off before it dries. Two or three fumigations between the stoning and colouring periods are advisable, as it is not good to do so after the fruit is coloured, the flavour being liable to be affected by the fumes. Cherries will hang a considerable time after they are ripe, provided the atmosphere be kept cool and dry. Measures must also be taken against the entrance of birds at the ventilators. *W. M. Baillie, Luton Hoo.*

THE HARDY FRUIT GARDEN.

PEACH AND NECTARINE TREES.—As the buds of these are now ready to burst into bloom, protection must at once be given. The protection curtains may consist of Frigi Domo, scrim, tiffany, hexagonal netting, fish nets doubled and trebled, or the rougher mode of using branches of Spruce Fir. Whatever be used, the materials should, if possible, be fastened up during the day, otherwise great tenderness will be induced in flower and shoot, and fertilisation not be so perfect or so general; and should Spruce Fir branches be employed, they must be so placed that light is in but a very small degree excluded from the trees.

Apricots.—These are now in full bloom, and the bees busy among them, so that there is a prospect of a good crop setting. A careful look-out must be kept to prevent the blossoms getting wet with rain towards evening, for then, should frost occur during the night or early morning, many of the blooms would be destroyed. If, on the contrary, the blooms are protected from rain by coping boards and Frigi Domo, slight frost will have no bad effect on them.

Fig trees.—These, where protection has been employed during winter, may be partially uncovered, admitting a little more light, which will have the effect of preserving the small embryo Figs from the ill effects of growing in the dark, and thus becoming drawn. The rest of the covering may be wholly removed when more genial weather sets in. *A. Ward, Stoke Edith Gardens, Hereford.*

THE KITCHEN GARDEN.

GENERAL WORK.—Globe Artichokes should be uncovered and the weak shoots cut away, leaving five or six of the strongest; the ground should then be well manured and dug over with a fork (it is as well to destroy a few of the oldest stools and to plant a few more each season, the best of the shoots removed being reserved for this purpose). To get good large heads the soil should be deeply dug and made rich. Asparagus will now be ready for removing to form new beds. The roots should be carefully dug up with a fork and replanted as soon as possible in shallow trenches about 6 inches deep, the ground having been prepared as previously advised. Early sown Celery should be transplanted into light rich soil in cold frames, and the lights kept close for a time. Cauliflowers that have been gradually hardened off should now be planted out during damp weather on ground that has been heavily manured; and in order to preserve as many roots as possible they should be copiously watered previous to lifting and again as soon as they are planted. Those in handlights may now be reduced to five in each, and these will be much benefited if a quantity of well rotted dung be laid on the soil over the roots, removing some and putting it on the manure. Box edgings should be clipped when there is no longer danger from frost; filling up gaps and replanting where necessary, but the latter work may be deferred till the autumn unless the garden soil is naturally very moist. Marjoram and Basil sown in heat should have plenty of air, and as the latter is very apt to rot off at the collar, it is a good plan to dust some dry sand among the plants and ventilate a little day and night. Seeds of both may now be sowed outside. Bush Basil is a hardier plant than Sweet Basil and quite as serviceable. *W. H. Divers, Ketton Hall, Stamford.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

SUBSCRIBERS TO

THE GARDENERS' CHRONICLE who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

THURSDAY, APRIL 19—Linnean Society.

SHOWS.

SUNDAY, APRIL 15—Ghent Quinquennial opens.

WEDNESDAY, APRIL 18 { Royal Botanic, Durham and Newcastle.

SALES.

TUESDAY, APRIL 17 { Carnations, Picotees, Roses, &c., at The City Auction Rooms, by Protheroe & Morris.

WEDNESDAY, APRIL 18 { Collection of Orchids formed by A. G. Wallis, Esq., of Balham, at Stevens' Rooms.
10,000 Liliam auratum, Roses, English-grown Lilies, &c., at Protheroe & Morris' Rooms.

THURSDAY, APRIL 19 { Imported Orchids from Mr. F. Sander, at Stevens' Rooms.

FRIDAY, APRIL 20 { Imported and Established Orchids, at Protheroe & Morris' Rooms.

SATURDAY, APRIL 21 { Carnations, Picotees, Lilies, &c., at Protheroe & Morris' Rooms.

Ghent. THE centre of attraction for professional horticulturists in the coming week will be situate in the city of Ghent. Thither at the close of the present week a large contingent of our horticulturists will wend their way to meet, not only their Belgian friends, but those from the uttermost parts of Europe also. Ghent itself is a city of 190,000 inhabitants—a busy, prosperous, manufacturing city—full of attractions for the lover of mediæval antiquities as also for sympathisers with the busier but far less picturesque industry of the nineteenth century. Of course that last phrase applies to cotton mills and such-like, not to the 273 nurseries and the 2000 plant-houses whose treasures will be displayed before the admiring guests on Sunday next! Nearly 200 jurymen have been summoned to adjudicate upon the flowers and other products, and their labours will extend over 417 classes—from new plants to flower-pot saucers, and will occupy the greater part of the day on Saturday. In the evening a "Raout" will be offered in the old Town Hall to the visitors. On Sunday the official opening, and the banquet to the jurors will take place. On Monday there will be an "international meeting," presided over by Count KERCHOVE DE DEN-TERGHEM, the President of the Royal Society of Agriculture and Botany, when matters of great importance to commercial horticulture will be discussed. On Tuesday a banquet will be given by the members of the Belgian horticultural Press, headed by the genial and eloquent Count DE KERCHOVE, to their colleagues of other nations. On Wednesday an official visit will be paid to the Royal

Gardens at Laeken. Besides these public functions there will be the 273 nurseries to visit (!), the numerous "monumens de la ville," the Zoological and Botanic Gardens, the University, to say nothing of the profuse private hospitality offered on this as on other occasions. To those who have the requisite leisure to inspect them the old Flemish capital abounds in objects of leauty and interest unconnected with horticulture. Antwerp, Bruges, and Brussels are near at hand, and the new installation of M. LINDEN (L'Horticulture International) at Brussels will doubtless attract many visitors. The London, Chatham and Dover Railway Company affords facilities for visiting various Belgian and Dutch cities, including a peep at the Hyacinths at Haarlem, though these, we fear, are much retarded by the ungenial spring.

The Royal Horticultural Society.

THINGS so far are progressing favourably with the old Society, as indeed they ought to do, for a very large amount of zealous work has been done, not only by the Council, but by the well-wishers to the Society. The meeting on Tuesday

FIG. 68.—ANTHURIUM CHAMBERLAINII, TO SHOW HABIT.

last at the Drill Hall, James Street, Westminster, was a very good one, well attended by the fraternity, though the visitors were but few. A general meeting was held in the afternoon at the new offices, 111, Victoria Street, near to the Drill Hall, which enabled the Fellows to judge for themselves of the great convenience which will be afforded by the Lindley Library and reading-room. The arrangements for these are rapidly approaching completion. At the meeting in question 166 new Guinea Fellows were elected, thirty-one at two guineas, and two Associates at 10s. 6d.—pretty good evidence of the sympathy that is felt for the Society.

At the meeting in question, it was announced by the President that a show will be held in the Temple Gardens on May 17, when, as we believe, the exhibition will be visited by the Lord Mayor, who, about that time, will be hospitably entertaining a large number of Burgomasters and other Belgian magnates. In the last week of September a fruit show will be held in the Corn Exchange, while a display of Chrysanthemums and fruit in the late autumn at Chiswick is likely to prove a very attractive feature. It was also announced by the President that a letter had been received from the Marquis

of SALISBURY to the effect that the interests of horticulture (and forestry?) will be recognised in the proposed new Ministerial Department of Agriculture—a feature we venture to think that may become of great importance in the future. At any rate it is the first time that any similar recognition of the claims of horticulture as a national industry, as important in its way as agriculture, has been accorded. Subsequently a portion of the new bye-laws were submitted to the meeting and confirmed, so as to render legal the election of Guinea Fellows. The remainder of the bye-laws will have to be considered at another general meeting, previous to which it is to be hoped that they will be submitted to consideration by the Fellows' Committee which was appointed for that express purpose. By some inadvertence this was not done on the present occasion.

It will thus be seen that a large amount of useful work has already been got through, but much more remains to be done ere the Society can be thoroughly reorganised and made to assume its rightful position as the national representative of all phases of horticulture, and not, as heretofore, of one or two only. Patience and the continued earnest co-operation of all classes are needed, while every legitimate step must be taken to increase the income of the Society.

RAILWAY FARES TO GHEENT.—Mr. HENRY PEARSON writes:—"The Continental Manager of the London, Chatham, and Dover Railway Company writes me to-day (April 9), that through tickets will be issued for Ghent show from London via Dover, Ostend, Ghent, Brussels, and Rotterdam to Haarlem, returning via Flushing, Queenborough, to London, at £3 18s., first class and £2 15s., second class. No rates are given for return tickets to Ghent only."

PARIS INTERNATIONAL EXHIBITION, 1889: AGRICULTURAL EXHIBITS.—All classes of agricultural machinery and products will be arranged, by national groups, in a special building erected upon the Quai d'Orsay, and forming a connecting link between the two main sites of the Exhibition—the Esplanade des Invalides and the Champ de Mars. It is the intention of the French Executive to cover the Esplanade des Invalides with exhibits of a specially interesting character, so that this large area will form one of the principal attractions of the Exhibition; and the direct route thence to the Champ de Mars will be through the Agricultural Palace. A space of about 40,000 square feet has been reserved at the eastern end of the building (i.e., the end nearest to Paris) for English agricultural exhibits, and it will be seen that this is a specially favourable situation, when it is remembered that the British section will occupy that part first visited in passing from the Esplanades des Invalides to the Champ des Mars.

NEW RECREATION GROUND AT ACTON.—The Acton Local Board, having invited plans and tenders for laying out and planting their new recreation ground, the plans submitted by Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crayley, have been accepted, the contract price being £1997. The new ground is on the east of Acton, and is bounded on the south by the Uxbridge Road; it is 25 acres in extent, and will comprise a cricket-ground, tennis lawns, bowling-green, summer-houses, band-stand, arbours, rustic bridges, and a number of ornamental beds and plantations. Acton is deficient in open spaces near its centre, and it is believed this new recreation ground will not only prove a great boon to the locality, but also assist in developing the district.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The quarterly meeting of the above Society was held on Monday evening last, April 9, at the Caledonian Hotel, Robert Street,

FIG. 67.—ANTHURIUM CHAMBERLAINI: LEAVES REDUCED; SPATHE, ETC., REAL SIZE, DEEPEST CRIMSON: FLORAL DETAILS MAGNIFIED. (SEE P. 462.)

Adelphi Terrace, Strand. Mr. E. BERRY, in the chair. The committee are glad to say that the number of members still continues to increase, twenty-four new members having been elected during the quarter, making a total of 250 benefit and thirty honorary members, including two life members. The committee earnestly hope that many more gardeners and persons connected with horticulture generally will avail themselves of the opportunity of joining this excellent Society. A copy of the rules will be sent to any address for six stamps, on application to the Secretary, W. COLLINS, 5, Martinhoe Terrace, Martindale Road, Balham. S.W.

ENTERTAINMENT TO THE EMPLOYÉS OF THE ROYAL HORTICULTURAL SOCIETY.—This was set on foot by a few of the frequenters of the Society's gardens and exhibitions, as an acknowledgement of the courtesy and willingness to oblige, shown by the members of the staff of the Society, and to mark the inauguration of the new régime. It was held at the Bolton Hotel, Chiswick, on the 6th inst. Mr. HARRY J. VEITCH presiding, having on his right Mr. A. F. BARRON, and on his left Mr. J. DOUGLAS DICK. In a very genial address the Chairman gave the toast of the employés of the Society, and in the course of his remarks, said that his first visit was paid to Chiswick in 1851, on the occasion of one of the great shows, when he saw Mrs. LAWRENCE, and was introduced to Dr. LINDLEY. Mr. A. F. BARRON responded to the toast. The health of the Chairman was proposed by Mr. SHIRLEY HUDNED, and in speaking to it, Mr. VEITCH gave some interesting details bearing upon the rise and progress of the Chelsea firm. In addition to the supper, the labourers and young men other than the students each received a sum of money, and they were all emphatic in their appreciation of the kindness and liberality with which they had been treated.

FINE VICOMTESSE HERICART DE THURY STRAWBERRIES.—A boxful of this variety was on Monday last exposed for sale in Mr. WENNER'S shop, Central Row, Covent Garden, of which thirty-six fruits weighed 18½ oz. The fruits were as fine as could be seen on plants much later in the season, well coloured, and thoroughly ripe. They were grown by Mr. ALLAN, Gunton Park Gardens, Norwich. As is pretty generally acknowledged by growers, this variety stands at the head of the list as a forcing Strawberry, being a heavy bearer, of good colour and size, and packing well.

"BOTANICAL MACAZINE."—The April number contains figures of the following plants:—

Nymphaea Kewensis ×, t. 6988.—This is a cross between the white-flowered *N. Lotus* and the red *N. devoniensis* ×. The flowers are of a beautiful rose-colour, and remain open in the afternoon—a period when most of the *Lotos* section are closed. This cross was raised at Kew by Mr. WARSON.

Brodiaea Howellii, t. 6989.—A species native of Washington Territory, with a globose bulb invested by a fibrous coat, and sending up a pair of narrow, linear, strap-shaped leaves and a central flower-stalk bearing a terminal umbel of pale lilac flowers, each about three-quarters of an inch long, with a bell-shaped tube, and a six-lobed spreading limb—the lobes ovate acute, about half the length of the tube. The figure was taken from a plant flowered near Cork by Mr. GEMBLETON.

Catleya lutea, t. 6991.—A common Himalayan plant allied to *Hedychium*, with lanceolate, acuminate leaves and erect spikes of yellow, six-lobed flowers. The globose capsule bursts into three valves, which become reflexed and expose the seeds, which are retained by the fleshy placenta.

Abies Nordmanniana, t. 6992.—A species often recommended in these columns as one of the hardiest and staliest of Conifers, and one likely to be very serviceable as a timber tree.

Masdevallia gibberosa, t. 6990.—A very extraordinary species, described in our columns in 1876, vol. v., p. 8, by Professor REICHENBACH. From a

slender trailing rhizome are sent up at intervals oblong spatulate leaves, and a slender erect terminal flower-stalk bent zig-zag fashion, studded with prominent warts, and bearing at the summit a raceme of three or four flowers. Each flower is about 2½ inches across, the calyx cup-shaped, the dorsal sepal boat-shaped, dull red with greenish ribs, and ending in a thread-like tail five times as long as the lamina. The lateral sepals are spreading, oblong, yellowish with red spots, and also prolonged into long tails; petals minute; lip small, oblong ovate, serrulate, its lateral lobes narrow, the terminal one small, orbiculate, serrulate; column slender. Introduced by WALLIS from New Granada to Messrs. VEITCH.

COVENT GARDEN LIFE-BOAT FUND.—A grand entertainment, in aid of the Covent Garden Life-boat Fund, will take place on Thursday, April 19, at the Prince's Hall, Piccadilly, to commence at 8 o'clock. The Stewards of the Fund have the satisfaction of announcing that the "Covent Garden Life-boat" was again the means of saving sixteen more lives from a watery grave during the day of the 15th ultimo, the boat being out for thirteen hours. The "Covent Garden Life-boat," stationed at Caister, near Great Yarmouth, was sent there in 1883, the previous boat, bearing the same name, having literally worn itself out in the performance of its mission of mercy. Since 1878, when Covent Garden was first identified with the Caister life-boat station, its life-boats have happily been the means of saving no fewer than 258 lives, besides helping to rescue eighteen vessels from destruction. During the past thirty years the two large and small life-boats at Caister, belonging to the Royal National Life-boat Institution, have been instrumental in saving more lives than any other life-boat station can lay claim to, their grand total representing 1085 lives saved, and seventy-one vessels assisted to a place of safety. The committee hope that these facts will be a great inducement for all their friends to again assist in contributing a handsome sum towards the annual support of their boat, which has done such noble service. Mr. J. WENNER, Covent Garden, is the Hon. Secretary.

ROYAL HORTICULTURAL GARDENS.—That portion of the whilom gardens of the Royal Horticultural Society at South Kensington not required for the Imperial Institute, will be utilised for the Anglo-Danish Exhibition, which will be opened by the Princess of WALES on May 14 next. The conservatory will naturally form a most attractive adjunct to that exhibition. The Princess of WALES has desired that the surplus arising from the Exhibition shall be devoted to the benefit of the British Home for Incurables at Clapham, the first Institution in the country to receive her patronage, and which was extended to it shortly after the marriage of their Royal Highnesses.

M. PLANCHON, whose death at the age of sixty-five we announced in our last issue, was well known in botanical and horticultural circles in this country, from the circumstances that in his early life he acted as Curator of Sir WILLIAM HOOKER'S herbarium while it was still in the possession of that botanist. The herbarium contains numerous notes and observations showing the keenness of M. PLANCHON'S observation, his practised eye, and his excellent memory. In later years PLANCHON was connected with VAN HOUTTE in the publication of the *Flore des Serres*, where his peculiar talents were likewise manifested. PLANCHON was one of the earliest to recognise the true nature and habits of the Vine-louse (*Phylloxera*), and was deputed by the French Government to visit the United States, where, thanks to the co-operation of RILEY and ENGELMANN, he amassed a vast amount of information, not only concerning the *Phylloxera*, but also relating to the species of *Vitis*. It was to a large extent through his investigations that the practice of grafting Vines on American stocks, which are much less seriously injured by the insect than the European

varieties are, was brought into use—a practice now generally recognised as on the whole the best plan for regenerating the devastated vineyards. M. PLANCHON was a constant attendant at the several Congresses held on the Continent for the promotion of botany and horticulture, and was everywhere received with the respect due to his knowledge and general qualities. M. PLANCHON was the author of numerous monographs, one of his earliest being one on the distinction between the arillus and the arilode—a cardinal point of morphology overlooked till his time; his latest was a monograph on the order Ampelideæ, in Dr CANDOLLE'S series of monographs.

A MONSTER BOUQUET.—On the occasion of the visit of the Prime Minister (the Marquis of SALISBURY) to North Wales during the present week, we read from the accounts of the proceedings reported, "The Countess DE GALVE presented the noble Marquis with a monster bouquet, over 3 feet in diameter, composed entirely of Primroses and Violets. This elegant bouquet was designed and furnished by Messrs F. & A. DICKSON & SONS, The Queen's Nurserymen, Chester."

NOTTINGHAMSHIRE HORTICULTURAL AND BOTANICAL SOCIETY.—The monthly meeting of the Society will be held at the Mechanics' Institute Nottingham (Room No. 71), on Wednesday, April 11, at 7.30 P.M., when papers will be read on Orchids and other spring flowers. The annual general meeting of the members will be held on Tuesday, April 17, at the Mechanics' Institute, Nottingham at 7.30 P.M., for the purpose of passing the balance-sheet, electing the officers, and other general business of the Society.

PRESENTATION TO A NURSERY EMPLOYÉ.—Mr. JAMES COLE, nursery manager for the last seven and a half years to Messrs. IRELAND & THOMSON, was on the 31st ult. entertained, on the eve of his leaving Edinburgh, at supper in Phillpott's Hotel, Newhaven, by a number of his friends. Mr. A. MCKENZIE, Warriston Nurseries, presided, and Mr. D. MITCHELL acted as Chairman. Mr. COLE was presented with an aneroid barometer in ebony, and Mrs. COLE with a gold ring set in brilliants.

DR. BODDAERT'S ORCHIDS.—We understand that this rich collection has passed into the hands of L'Horticulture Internationale of Brussels.

PLANTS AND THEIR CULTURE.

TUBEROUS-ROOTED PLANTS.—Gloxinias, Caladiums, Achimenes, and tuberous Begonias, are subjects of great beauty generally, and which by judicious management may be enjoyed from April to November, when the first sown seedlings of Gloxinias and Begonias will bloom. The bulk of the resting stock of these plants should now be potted in a free and rich compost of about equal parts of light fibrous loam, leaf-mould, and well-decayed manure, with enough sharp sand to keep it open. Plant the tubers firmly, but slightly, under the surface, so that they are just covered with the soil. After potting, guard against the soil getting too wet, for should this occur before the roots have permeated the soil, the compost becomes sour, and the plants do not thrive. Watering will seldom become necessary if due attention is paid to moisten the shelves or benches on which the pots and pans stand, and to wetting the sides of the pots with the syringe. With the due use of shadings no further watering will be necessary till the plants have made some considerable advance in growth. Gloxinias like a position near the glass in a close pit where a temperature from 60°—65° is maintained, which degree of warmth is very suitable if the plants are intended for use in furnishing; but a higher temperature may be allowed if they are to remain in a warm house to flower. During growth keep the atmosphere thoroughly moist, but avoid much syringing overhead, this being apt to cause weak growth. Caladiums, after they have fairly started to grow, require abundance of water, and will succeed better if placed in a higher temperature than that suitable for the

Gloxinia: 70°–75° suits them well. Being tall growing plants they are well adapted for roomy structures, but if they are placed at a great distance from the glass as much light should be afforded them as possible, otherwise the leaf-stalks become too weak to sustain the weight of the leaf. Moreover, full exposure to the sun brings out well the markings and colours of the leaves; but if no shading be used the watering must receive close attention, and this will be much lessened if the pots can be partially plunged in a tan bed. Although there have been many hybrid forms introduced of late years, yet there are some few of the old sorts which are quite as good as the new-comers, and well worthy of cultivation. Such are Chantini, bicolor, and the beautiful little argyrites, so very useful in many ways. The size of the pots will be regulated according to the purposes for which the plants are required; but if large specimens are desired liberal potting should be afforded.

Achimenes.—Whilst these will succeed under similar conditions to Gloxinias, they are suitable for growing in baskets. Large shallow wire baskets are the best, and these should be well filled with light fibry material, and thickly planted, which operation is best done when the young plants are a few inches high. If carefully shaded and kept in a moist temperature for a short time after planting, they will soon establish themselves. Pans and shallow pots suit the plants admirably. As the plants come into flower they may be drafted into the conservatory, where they will be conspicuous objects for many weeks. Some of the sorts succeed well in a greenhouse temperature—notably *coccinea* and *Dazzle*.

Begonias—unless with seedlings in the earlier stages—require very little fire-heat; indeed heat, if not well balanced with light and air, soon spoils the plants by causing a weak and comparatively flowerless growth, whereas plenty of light and cool airy treatment, favour a sturdy and floriferous habit. A cool pit or frame suits them well, using no more shading than is actually necessary. Pot on young plants of these and Gloxinias before they get pot-bound, and sow more seeds for succession, treating them as recommended at p. 143, February 4. *F. Ross, Pendell Court.*

NOTICES OF BOOKS.

THE ANNALS OF BOTANY.

The February number of this journal, edited by Professor Balfour, with sundry collaborators, and which concludes the first volume, shows a marked advance upon its predecessors, and this we may say without in the least detracting from the value of the earlier numbers.

Professor Green writes on the tuber of the Jerusalem Artichoke, which contains inulin instead of starch. When required for use by the growing plant the inulin is acted on by a peculiar ferment, which converts it into sugar. This ferment is not actually present prior to the commencement of the sprouting of the tuber. Mr. F. W. Oliver details the curious anatomical structure of the sensitive labellum of *Masdevallia muscosa*, as originally described in our columns by Mr. W. Bean. The object is to secure the removal of the pollinia by an insect, which, alighting on the lip, is immediately entrapped without power of escape until he has effected Nature's purpose. Protoplasmic continuity is demonstrated in some of the cells of the lip—another illustration of the great significance of this discovery, for which we have largely to thank an English physiologist, Mr. Gardiner, of Cambridge.

Professor Bower pursues his researches into the life-history of Ferns, showing the importance of studying the prothallus or oophyte of Trichomanes and its allies, not only for physiological reasons, but for purposes of classification. Professor Marshall Ward supplies a very useful and opportune article on the sources whence plants obtain their nitrogen, the great difficulty being experienced with reference to the Leguminosae. Professor Ward summarises the observations of Frank on the association or "symbiosis" of fungal threads with the roots of many plants—a fact familiar enough to all who have to do with nursery work, though no one till lately ventured to think that the fungus was

anything but injurious. Another instance of the same kind is afforded by the peculiar tubercles on the roots of Leguminosae, often made the subject of inquiry, but now shown by Professor Ward to afford an "exquisite example of symbiosis between a fungus and a root." The fungus stimulates the root, causing it to swell, and in the swelling to store up large quantities of food-material, the stimulating action of the fungus enabling the root to acquire relatively larger amounts of nitrogen from the soil than it would do without the assistance of the fungus.

Several short notes are added, as well as an obituary record for the year, in which the leading facts in the life-history of deceased botanists are very briefly summarised, and a list of their principal publications appended. To this succeeds a record of current literature, containing the titles of the principal botanical memoirs and books published within the year. Periodical literature is treated in the same way, but we are surprised to find that our own pages have not been drawn upon when the contents of some foreign gardening publications and many homologous English periodicals have been duly noted.

The volume now completed is creditable to British and American science, and may take its place side by side with the best of the German publications of similar character.

PFLANZENLEBEN. Von Anton Kerner von Marilaun. Leipzig: Verlag des Bibliographischen Instituts, 1877. (Plant-Life.)

This is one of those books which makes us envy the German public—if not despair of our own. We fear no English publisher could be induced to publish for popular use so expensive a work as this. It comprises a general sketch of vegetable life, including both anatomy and physiology, and is beautifully illustrated with more than 520 woodcuts and twenty coloured plates. The illustrations are admirable, mostly original, and presenting a marked contrast with the hackneyed copies found in most English books. The information given is of the most complete and recent character, much beyond what is considered good enough for English readers of the same class. One drawback it has for English eyes in the fact that it is printed in the old German character, which might well be allowed to become obsolete. Moreover, it has no index.

AMARYLLIS AS WINTER BLOOMERS.

Of all the plants which may be cultivated specially for winter blooming, none are so gorgeous and striking as the members of the *Amaryllid* genus; and considering the ease with which they may be grown, the certainty of their flowering, and the length of time the flowers last in a cut state, it is surprising they are not grown very largely. Exception is sometimes taken to plants flowering without foliage. This is, I consider, of small moment, as it is a simple matter to introduce the pots without foliage amongst Orchids, Gardenias, Eucharis, or Ferns, and many other things. The foliage of *Richardia* *ethiopia* will set off the cut flowers to perfection. It is not my intention to deal with *Amaryllis* as a specialty, and as they are grown in some of our leading nursery establishments, but as regards their adaptability as winter bloomers in ordinary gardens. During the dreary months of winter they are more welcome, when there is so little of brilliant colour in our houses.

For the last twenty years I have cultivated *Amaryllis* of the older type, such as *A. grandis*, *A. Ackermani*, *A. Johnsoni*, &c., for winter bloom, year after year, with the best results, without injury to the bulbs, and have had them more or less in flower from September to April.

To have the plants entirely under control, it is best to grow them in small pots—those of 4, 5, 6, and 7 inches in diameter are the most suitable; and

in these sizes they may be successfully bloomed for some years without being disturbed in any way, unless it be to examine the drainage. There is, in fact, a disadvantage in potting, there being less certainty of the bulbs maturing early, and the plants become inclined to prolong their season of growth unduly. Those, however, will bloom with certainty later. When they are not potted for several years there is little else but roots in the pots, and it becomes necessary when they are making their growth to give them frequent waterings with weak cow-dung water.

As soon as the foliage commences to push, the pots should be placed on a shelf close to the glass, to prevent the foliage getting drawn. A temperature of 60° to 65° should be maintained until they have finished growing, and the foliage must be kept clean and uninjured. A stick should be inserted in each pot, and each leaf slung up separately. Prepare a cold pit or frame by making a porous floor of coal-ashes. On this stand the pots as they mature their growth, affording each plant space sufficient for the foliage to stand clear; and the space between the pots will be the better for being filled with cocoa-fibre. As the foliage ripens gradually withhold water, and when it withers and falls off give no more; remove the lights unless during rain, and let the plants have full benefit of sun and air.

By the beginning of September some of the earlier matured bulbs will commence to show flower, and as these appear remove to an intermediate-house, and place them on a shelf close to the glass. By the beginning of October the whole stock may be placed in the same quarters, and watered with tepid water. *Amaryllis* are liable to be attacked by red-spider and thrips, but these may easily be kept under by syringing with water at 85° mixed with a small quantity of petroleum. *Wm. M. Baillie.*

NURSERY NOTES.

MESSRS. J. VEITCH & SONS, CHELSEA.

The house of *Amaryllis* is just now the chief point of attraction for those who are not Orchidophiles, and here may be found numerous examples of Mr. Heale's triumphs as a hybridiser of this genus. It may be said in passing that the flowers were brilliant and large, but the newest and less new alike showed signs of having passed through a trying winter season in their lessened vigour and shorter flower-stalks. Fogs, cloudy skies, and a long-continued low temperature will always tell injuriously on some of the inmates of the greenhouse, stove, and other plant-houses, as all gardeners employed in large towns know too well.

Of new varieties the following were noted:—*Chevalier*, crimson; *Acquisition*, bright scarlet, banded with white; *Alberta*, a small flower, ground colour scarlet, having white bands running down each petal; *Finette*, a very large flower, white; *Hazeldon*, of a new shade of carmine, the petals tipped with white. There have been seen flowers of a similar hue, but this one is a distinct advance in size of flower and form; *Chieftain* has very large flowers, scarlet, prettily reticulated with lines of a slightly darker tint. Of older varieties we may mention *Her Majesty*, still one of the finest of its colour; *Sir Walter Scott*, *Fabiola*, a cherry-red with green band in the centre of each petal; and *Landseer*, crimson (1887), is very fine this season. The collection is of much interest, and should be seen by all who are partial to these gorgeous plants.

The show will endure for some weeks yet, numerous succession plants having been noted in the side beds of the show house.

The so-called "Flower House" was gay with flowering plants of a hardy or semi-hardy nature, the highest note of colour being struck by the Ghent and mollis section of hardy Azaleas. The Hyacinths many of which have been seen at metropolitan exhibitions recently; Lilac of foreign growth, dwarf and full of flower. *Lachenalia bicolor*, grown in baskets

of wire; *Spiraea confusa*, a very free-flowering species, of twiggy upright habit, the flowers white, in corymbs of an inch in diameter; *Staphylea colchica*, *Deutzia gracilis*, *Genistas*, *Rhododendron Early Gem*, *Roses*, &c., formed the bulk of the flowering stuff. In the warm *Rhododendron*-house, *R. balsaminiflorum* album, a small plant, was found in flower. If this should prove a good grower and free to flower there will be a great demand for it, as the flower is the ideal of a bouquet or a button-hole flower.

In the *Odontoglossum*-houses plants were found in flower of *O. pulchellum* and its yellow variety *O. Cervantesi*, *O. triumphans*, *O. Andersonia*, *O. Alexandra*, and a nice piece of *Angraecum sesquipedale*, with six fresh flowers; *A. citratum*, *Miltonia Roezli* alba, *Oncidium ampliatum*, and many others. The *Cattleya*-house was, as usual, well filled with the finest flowering specimens. *Cymbidium Lovianum*, *Cattleya intermedia*—many—but one large specimen was bearing sixteen spikes of bloom. Of *C. Mossia* and *Laelia purpurata* there are hundreds which will shortly be in gorgeous flower. *C. elegans* and *C. Lawrenceana* were in bloom. The healthiness and blooming capabilities of the various Orchids in this large house cannot be excelled by any others. In the houses set apart for the *Cypripedia* much of interest was to be observed in old and new species and hybrids. Adjoining houses contained, amongst other Orchids in flower, *Lycaste Harrisoni*, *Acrides rubrum*, a rosy-lilac flower; *A. Houletti*, an elegant thing, buff, with rose-coloured lip; *Dendrobium nobile* album, a small plant; *D. Goldianum*, rosy-purple—a nice spike; *D. Brymerianum* and *D. albosanguineum*. *Maxillaria Sanderiana* will be in flower shortly.

TREES AND SHRUB.

RETINOSPORAS.

I ENCLOSE herewith two small branches cut to-day from a plant 3½ feet high of *Retinospora plumosa*, Hort. The smaller is *plumosa*, the larger is typical *pisifera*, and is merely a portion of a primary branch some 16 inches long, proportionately feathered, that originated directly from the stem at a point about 2 feet above the surface of the ground. The *pisiferoid* branch was not only much the largest on the plant, but had also a more vigorous look about it than the other branches, and, unlike them, took a directly horizontal direction, as in the typical *pisifera*. The interest in the dimorphism of the plant is increased to the morphologist and physiologist by the fact that the *pisiferoid* branch only was fertile. *G. Snyne*.

[We are indebted to our correspondent for this interesting specimen, which affords one more illustration that *plumosa* is only a juvenile, and usually transient form of *Thuja pisifera*. We have similar specimens from Mr. Maurice Young, and also a shoot of *pisifera aurea*, produced from *T. plumosa aurea*. We have also seen fruit produced on *R. plumosa aurea*. Eo.]

JAPANESE MAPLES.

Acer polymorphum and its Varieties.—These beautiful deciduous hard-wooded shrubs we strongly recommend for growing in pots or tubs for greenhouse or conservatory decoration, and especially in the young state, as being most graceful for table ornamentation. They are particularly useful as affording contrast with other plants either in the spring and early summer time for their delicate tints, or in the autumn during the ripening period, when their gorgeous foliage assumes the hues of the Virginian Creeper.

Amongst the varieties exhibited we find the earliest kinds brought to this country—viz., *Acer polymorphum sanguineum* and *atropurpureum*; these two varieties are amongst the hardiest, and are therefore suitable to plant in cold countries. Another variety, *Acer polymorphum palmatifidum*, possess a beautiful green colour, and is very serviceable, changing in autumn its lovely tints. A very light and graceful kind of this, called *laciniatum*, has

reddish-coloured points to the shoots dying off in light colours, *A. polymorphum dissectum* has a similar habit, with crimson foliage.

In striking contrast to these, we have the newest varieties, conspicuous amongst which is *A. Itaya*, with large emerald-green fan-shaped leaves, very picturesque; *A. Benni Shidare*, a most quaint and handsome Fern-leaved variety; *A. Atho Ba*, with bright green leaves, which are bronzy-red in their young growth; *A. nomina*, deeply serrated crimson leaves, veined with scarlet; *A. Choshio*, intense scarlet deeply serrated leaves; *A. Shikara mama*, green and white leaves; *A. Taimen Nishiki*, deeply dissected purple-bronze leaves—a Fern-like and beautifully distinct variety. Also a few unique specimens of Japanese art inarched with several of the most distinct varieties on one plant. In addition to the above we can strongly recommend the following:—*Aho Shidare*, *Fiure nise nige*, *Itatsu Yuki*, *Kagiri*, *Oridora Nishiki*, *Toi nire nike*. The above fine selection of Japanese Maples were exhibited by the Lawson Seed and Nursery Co. at the Royal Caledonian show, Edinburgh, April 4 and 5 last. [Did the Company provide an interpreter? We have great respect for legitimate priority of nomenclature, but we are sure the Company would have been forgiven had they attached English names to these variations. Eo.]

PRUNING SHRUBS.

This important operation is often performed in an unintelligent way. We may presume that nearly every shrub has its own peculiar habit of growth, and this habit should always be regarded—as it is—as one of its chief beauties, and therefore, in our interferences with these every attention must be directed, but particularly in pruning, to preserve that peculiarity of habit. By all means remove straggling or ungainly branches where such occur, at the same time avoid pruning all shrubs into the same shape, else by so doing their individual identity is destroyed, and with it half their beauty. Pruning is often performed in early spring—all shrubs being treated alike—and yet it is utter folly to prune a *Deutzia*, a *Forsythia*, a *Mock Orange*, and hundreds of others at such a time, for by so doing their flowering shoots are destroyed; but prune these in June after they have finished blooming, and you induce the growth of young wood which is to bear flowers the following season. How seldom this advice, which we have before recorded in these pages, is acted upon—not in one garden in every hundred. A *Spiraea*, a *Lilac*, or a *Honeysuckle* may, with perfect success, be trimmed during winter or early spring; but a good general rule is this—that in the majority of cases, pruning can be best effected, and with least damage to the flower-bearing shoots, by having this performed immediately after the blooming season is past.

ZENOBIA SPECIOSA.

This is a pretty, nad, at the same time, rarely seen North American shrub, with a profusion of pure white Lily-of-the-Valley-like flowers when it is well grown. Swampy land is the favourite haunt of the *Zenobia* at home, and it makes little satisfactory progress when planted in dry soils of any kind, and therefore to grow the plant well a damp peaty loam, such as *Rhododendron* favour must be selected. A yard or so high it may usually be seen, of rather neat habit of growth, and, if in good health, thickly studded with white bell-shaped flowers.

ZENOBIA, OR ANDROMEDA FLORIBUNDA,

is a pretty well known plant, and, like the one just mentioned, it is somewhat difficult to manage, requiring a cool, moist soil—such as every one does not possess in his garden—and a shady situation; but the latter, we have noticed, is not of great moment where ample but not stagnant moisture is secured.

It is a shrub of usually a yard in height, and as much through, when well developed, and when in good health amply furnished with foliage. The pretty little creamy-white flowers are borne in great profusion, and being of good substance, remain on the plant for a considerable length of time. *A. D. Webster*.

HOME CORRESPONDENCE.

Correspondents will greatly oblige by sending early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings of gardens, or of remarkable plants, trees, &c., are also solicited.

ROYAL HORTICULTURAL SOCIETY.—I trust that the new grade of Associate of the Royal Horticultural Society will become popular with gardeners. The Associateship I hope to see become the Gardeners' Guild, and should be worth at least £5 a year to the possessor. I look forward to the time when every gardener will from necessity be obliged to be enrolled. I think the Society should grant certificates or diplomas to gardeners on election. Owners of gardens will not be slow in recognising the value of men who hold these certificates, and they will feel some confidence in entrusting the charge of their gardens to men who have some recognised authority to be called gardeners, and thus it will raise their social and professional position. How many gentlemen have had, at some time or other, in their employ men who could talk a dog's hind leg off, but who were entirely dependent on their superordinates for the welfare of the plants entrusted to their charge? This class of men are a positive injury to young men who have ability, and they too frequently occupy places of trust when they themselves are only fit for employment as garden labourers. I therefore think that the Council has done wisely in requiring that candidates for Associateship should be recommended by two Fellows who can speak of their professional ability from personal knowledge. [One only is thought sufficient.] I hope the day is not far distant when the Council will require candidates to give satisfactory proof that they are worthy of election. Associates will be eligible to serve on the Fruit and Floral Committees, and, of course, they will have the right to vote on those committees. At present there are members of these committees who are neither Fellows nor Associates; I, therefore, proposed to the Council that in the new byelaws it should be stated that no person should be eligible to serve unless he was either an Associate or Fellow, but the Council considered that it would be better to postpone the consideration of this question, and that it should be taken in conjunction with the whole question of the duties and mode of election of committees, which subject they hope to discuss at an early date. I trust that societies which hereafter may become affiliated with the Royal Horticultural Society will only employ such gardeners to act as judges at local shows who hold the Associateship certificate. I do not think that 10s. 6d. is an excessive charge to ask for the privileges and benefits which I expect will result to gardeners on becoming Associates. We want true and good men to join, but we must take care to exclude unsuitable persons. *A. H. Smee*.

I think Mr. D. T. Fish may expect a few lines from me after his remarks on the reconstruction of the Royal Horticultural Society at p. 403. I have the greater pleasure in sending them from having a lively recollection of how Mr. Fish worked for the success of the Society's show at Bury St. Edmunds, and also of the beauty of Lady Cullin's garden, especially the landscape effects which he showed to me, and which were, I believe, owing to his taste and judgment. I will begin by thanking him for his good wishes for 500 guinea Fellows. These, I am happy to say, are coming in most satisfactorily. I thought, and think, that guinea subscriptions are the lowest rates which will support a society, Fellows' subscriptions are not all profit, each new Fellow causing expenses now, and when the Society gets stronger and therefore more active, these expenses will be considerably increased. I was not against the 10s. 6d. Associates, as the expenses which their privileges involved were not proposed to be great. Why I appealed to owners of gardens is that I think that they would subscribe to the Society if they could only be made to feel how the produce of their gardens has been, and is being, improved in quality by the work of the Society's committees and Chiswick garden; and besides this, other members of Council have more influence than I have with "practical gardeners," and to make the Society the success it ought to be each one must work on his own ground for the common good. I do fear that a guinea, and even half a guinea, with the attendant travelling expenses, is more than many really good gardeners

can properly afford to subscribe; but I am happy to say that gardeners in general understand why I especially address my own class, and do not consider themselves in any way slighted, as is shown by their giving their names for the 500 not only by letter, but at the Tuesday meeting in the Drill Hall three first-class gardeners asked me to propose them as guinea Fellows. I have seen a great deal of the high class gardeners who serve on the committees; I know them and they know me, and I have no fear that they will misunderstand anything that I write. I think I have now said all that is required, but perhaps I should add, that while I have spoken of 500 guinea subscribers to be brought in within a year, I have long believed (see note in *Times*, October 10, 1876) that 5000 guinea Fellows could be got without difficulty by united work, with prospects of an increase in numbers. *George F. Wilson.*

Your insertion of my note on guinea Fellows for the Royal Horticultural Society has had the effect of bringing in some first-class names of candidates for guinea Fellowship. Will you allow me now to say that the Council has decided to make the personal admission, given to guinea Fellows, transferable? This will meet two difficulties; one pointed out by an influential friend, an energetic believer in "the guineas," who gave me one day sixteen names of candidates. He found that some of his leading City friends desired to become Fellows, but, as they were too busy to attend the "fortnightly shows," they could not use the tickets, while they wished that their wives should be able to do so. The transferable ticket will admit of this. Again, friends of the Society living in distant parts of the country and never coming to London, feel that if they became Fellows, they ought to be allowed to send the tickets to a friend who could attend the shows. This was strongly urged long ago by my old friend the late Mr. Isaac Anderson-Henry, of Edinburgh. They will now be able to do this, and the result will be, that we shall have exactly the right sort of visitors to the fortnightly shows. It was often a grief to many of us at South Kensington to see really beautiful and most interesting little fortnightly shows, when by far the greater number of those present to benefit by them, consisted of gardeners, nurserymen, and amateurs, who had served upon the committees, and who were looking at each other's exhibits, and at the same time to know that there were numbers of ladies and gentlemen within easy reach of the shows, with a real love of flowers and plants, who would delight in seeing shows, which, though small, contained the pick of the plants of the most celebrated growers of each class; and new, little known, and interesting plants, fruits, and vegetables, sent up for judgment to the committees from all parts of the country. Now that the Society will consist mainly of Fellows who join the Society to advance gardening, and not to have the use of a London garden for their children to exercise in, it may be expected that these fortnightly shows will be popular to an extent they have never been—at least, since I have known the Society—more than twenty years. Judging from the first most beautiful and interesting show in the new quarters, the London Scottish Drill Hall, on the 28th, the London leaders of the trade, and some of the greatest amateurs, mean to make the fortnightly exhibitions most attractive ones. The natural effect will be that, before long, they will be attended by numerous visitors. This will induce still greater exertions on the part of the exhibitors, followed by a greater number of visitors, and so onwards. Several friends whom I have asked to join as guinea Fellows have answered by applying to be made two-guinea Fellows. I should hope that the much larger privileges given to the four-guinea and two-guinea Fellows will have the effect of causing many ladies and gentlemen able to be pretty constant visitors to the fortnightly shows to subscribe at the higher rates, and that some will become four-guinea Fellows mainly to give a helping hand to the Society in its new and purely horticultural start of life; but I feel sure that the great bulk of the Society will, like the Royal Agricultural Society and the National Rifle Society, consist of guinea subscribers; and I believe that a Society mainly supported by a very large number of guinea subscribers will be stronger and more lasting than one dependent on a smaller number of subscribers at higher rates. *George F. Wilson.*

BEGONIAS.—Your correspondent, "Boliviensis" (p. 393 of your issue of March 31 last), writes about the progress and improvement of the Begonia in Scotland. I fancy he must have been in Bolivia for the

last ten years or he would have been better acquainted with the very great advance and improvement the plant has made in Scotland, both for indoor decoration and for outdoor bedding, during that period. Mr. Thomson, Drumlanrig Gardens, and Mr. Robb, Drummond Castle Gardens, were the pioneers of Begonia culture in Scotland, more especially as outdoor bedding plants; and both these eminent gardeners have been most successful in proving long since that the plant is well adapted for flower garden decoration; yet it is surprising how slow the gardeners in Scotland have been in taking to their culture. Now, however, "Boliviensis" will find them bedded out as far North as Ross and Inverness and other shires, and they are becoming more and more appreciated. *Alpha.*

LETHORION.—I have given this new insecticide a fair trial in the Peach, Cucumber, Melon, and plant-houses here, and can speak of it in high terms. It is a sure and sudden death to all kinds of fly and thrips, without causing the slightest injury to the tenderest fronds of a Maidenhair Fern. I look on these "vapour cones" as a boon to gardeners, particularly for smoking-pits and frames. Ladies will be able to fumigate their greenhouses themselves; in fact, a child of six can light them without the slightest danger. They should be set alight with a taper, and care should be taken to have every aperture in the house or pit properly closed. Should it be possible for the inventors (Messrs. Corry, Soper, Fowler & Co.) to send it out at a lower price, I have no hesitation in saying that "Lethorion" would be immensely popular. *W. G. Praeger, Sherborne Castle, Dorset.*

WEeping LARCH.—I would ask if the Weeping Larch at the Godalming Nurseries is the weeping variety of the common Larch? (mentioned by Loudon), or the American, *Larix pendula*, the Swamp Larch or "Hackmatack"? The drawing you give of it is much more like this last tree in the form which it assumes when grown upon a dry soil than any form of the European Larch that I have seen. *C. W. Strickland.* [We believe it is *L. Europea*, but Mr. Young will kindly explain. *Ed.*]

COPYRIGHT OF FRUITS.—Under this heading Mr. T. F. Rivers comes to a conclusion that is rather illogical and perhaps a little remote from the point at issue. He mentions a philosophic belief—purely theoretical of course—that our excessive civilisation may eventually end in man becoming once more that hairy quadruped yclept monkey or perhaps ape. In such case, says Mr. Rivers, the creature will have some better diet in the fruits left by man and produced also by civilised methods, than were the primeval hips and nuts. But if this odd form of reversion is to follow upon excessive civilisation, is man to be the only sufferer? Logically, will not all animal and vegetable life produced by civilisation revert to natural forms in the same way? Surely the present wonderful fruits which now enrich our gardens are as much civilised products of original and remotely inferior species as man is a civilised product of the antediluvian ape. We cannot hope that fruits will do other than revert to hips and haws in those dark days when man shall once more become monkey. As to the question of the quantity of copyright to fruits or indeed to anything else vegetable, the desire may be natural but the realisation is impossible, and because impossible it is useless further to argue the question. Mr. Rivers may maintain an absolute right over fruits of his own raising as long as he retains the stocks in his possession, but with disposal of stock goes all further claim, and no power on earth could or would give him or any other raiser further claim upon what was thus parted with. *A. D.*

LIME FOR STONE FRUIT TREES.—It may interest your readers, after the communications in your issues of February 25, to inform them that Mr. Rivers, in the *Orchard House*, 1879 edition, states:—"I have for some time suspected that which I now know, viz., the necessity of calcareous matter in all composts used in the cultivation of stone fruits. On a careful examination of the soil, particularly the loam used in potting fruit trees, I found it to be, like all the soils of this district, full of finely comminuted chalk, and to this large preponderance in our sands and loams is owing a part of the great success which attends the cultivation of orchard-house fruits here. I believe the addition of chalk to compost not calcareous and to loams of a ferruginous nature to be quite necessary in the culture of stone

fruits, and if not necessary, still most beneficial to all kinds of fruit trees." In a letter to myself, which is quoted in my pamphlet, Mr. Rivers writes:—"Boulder clay with patches of sand, gravel, and London clay all lie above the chalk in this district. The chalk exists in the boulder clay, and, in fact, permeates the entire system of gravel, sand, and boulder clay, and gives strength and fertility to the trees, and flavour to the fruits and vegetables." Dr. Haviland, in the *Lancet* of February 25 and March 3, states that the carbonate of lime of which chalk is composed cannot fail to have a neutralising effect on the sourness of soil, and that chalk and other absorbent rocks which he mentions when underlying clays sufficiently near to the surface of the clay, cannot fail to exert a beneficial influence in neutralising sourness and effecting drainage. *The Author of "A Guide to the Choice of a Site."*

THE CINERARIA.—Lovers of this plant will find a rare treat before them if they care just now to get so far as Woodside, Farnham Royal, Slough, and there inspect Mr. James' large and well-grown plants. Some few have been favoured to see plants of the strain at one or other of the early gatherings of the London societies, but select as these were in quality and refinement, yet they fail to produce that sense of surprise which arises on looking over the hundreds of plants, all in luxuriant and very fine bloom. The bulk of the plants are grouped as far as possible into colours. *A. D.*

STACHYS TUBERIFERA.—This novelty in vegetables, which you figured on January 7 last, and which is likely to be of value as a culinary tuber and also for salads, forces well. My treatment was as follows:—Sets were planted in 12-inch pots in December, the temperature maintained being 50° to 55°. I have also grown it in cold frames, with good result, having as many as 100 tubers on one plant. I have also planted a number of the tubers in the open ground this year, as I find it is almost hardy, and comes in as a change at the dinner-table. The tubers which were lifted in September and October last have kept well until now. *J. Claydon, Gay's House, Holport, Maidenhead.*

MULCHING.—Planters are often afraid to use manure about trees and shrubs, but for many years we have used half-rotten manure immediately above the soil placed next the roots, and in every case with the most satisfactory results. Last year, when planting an avenue of Austrian Firs and large breadths of tall Poplars, Planes, and other trees, we used good mulching, packed all over the soil, which had been placed firmly over the roots. There were months in which scarcely any rain fell, and having no water at hand the trees had to take their chance. All lived, and made a little healthy growth, and are now able to hold their own. Many hundreds of shrubs were planted last April, and well mulched; they, too, are in a satisfactory condition. While lifting and transplanting large numbers of choice Rhododendrons, Yews, Lilacs, Briers, Thorns, Hollies, Retinosporas, and many kinds of Conifera lately from poor gravelly soil, I noticed that they were well rooted. These, when planted during April and May, four years ago, had been liberally supplied over the surface of the roots with rotted cow manure mixed with loam, and all well trodden down, with clean soil thrown over. If a little liberal mulching were practised when planting on poor soils, there would be fewer reports of failures and losses. *Scot.*

TOO MANY DAFFODIL NAMES.—Some of the most beautiful of the Daffodils are now in flower at Temple Hill, all being subjects collected in a wild state, but developing their special charms under suitable cultivation, viz., shallow planting, excluding all manures, for they detest it, but using coarse sea sand and fresh cut turfy loam. As a distant member of the Narcissus Committee, I would suggest that we make a start in some way with selections from collected bulbs, and that next season, some one or two growers, favourably situated as regards soil and climate, should take large numbers to the Daffodil Committee from the sections *Narcissus pallidus* *precox*, *N. nobilis*, and *N. variformis*, so that each member at the sitting could have a supply to take away and compare with what he had growing in his garden. In this manner a start would be effected, and simple registry by numbers might be adopted. I have varieties of *N. pallidus precox* with broad bluish-green toxifolius-like leaves, and the blooms the counterparts of those of *N. Emperor* and *N. maximus*, but straw-coloured; while in *N. nobilis* and *N.*

varifera there are some wonderful bicolors. Indeed the two coloured flowers of the Conference, list of 1884 should by this have become absorbed or lost sight of, and probably now hide their diminished beauties before *N. nobilis bicolor* in particular. Away, then, with the rubbish which has had its day before the flood, and let us start afresh and number the introductions from the Pyrenees. Why should we be always having this misleading cry of too many names constantly brought by the committee, when we take into account that though there are fifty-three such names in the "major class" of the Conference list of 1884, and some forty in the "bicolor" and lorifolius sections, which, to my mind, will never see the light, whilst the wild beauties, Nature's children, are crowding in on them and coming to the front in thousands, why must the latter be only approached as "wildlings" because the art of man had no part in their production? May not many of the varieties now in commerce, for aught we know, be only chance seedlings—escapes from gardens, distinguished though they be by the B. L. at the bar of criticism. *W. B. Hartland, Temple Hill, Cork.*

MEDINILLA MAGNIFICA.—This is a noble plant, surpassing all other flowering stove plants in the spring and early summer, in the beauty of its pendulous racemes and its striking foliage. We have a plant measuring 8 feet in diameter, bearing upwards of sixty-eight racemes in bloom. The terminal ones are very fine, and some of the buds (twenty-five) breaking from the old wood are almost as good, some few are rather smaller. In the *Gardeners' Chronicle* of July 3, 1875, is a note of a plant in Lord Falmouth's garden, which bore fifty-seven spikes. *N. Blandford.*

STRIKING AUCUBA CUTTINGS.—Having met with considerable success in the propagation of Aucuba cuttings, a few notes may be useful to those persons who wish to increase their stock of this valuable shrub. Take the cuttings in the early part of October, choosing stout shoots of the current year's growth about 4 inches long and taken off with a heel. Prepare a sufficient number of 7-inch pots, crocking them freely and filling them with sandy soil, on the top of which place a layer of sharp silver-sand; water the soil to make it firm. Dibble ten cuttings into each pot, making them firm in the soil by again watering them lightly. Plunge the pots up to the rims in coal-ashes in a cold frame having a southern aspect. In this position they should remain until the middle of the following March. During this time they will require very little water or air—just enough of the former to keep the soil moist and a sufficiency of the latter on fine days to keep all sweet and clean. In March the pots should be plunged in a gentle bottom-heat (a partly spent hot-bed answers well), when roots will quickly be formed; and about the end of April the plants should be carefully separated, to prevent breakage of the roots, planting them in good soil on a border facing north, in rows one foot apart and 10 inches from plant to plant. In this position the plants should remain until the following April, when they can be transplanted to other quarters, or they may remain where they are for another season. Should any of the plants show a tendency to run up with one single stem instead of branching out, the point of each should be cut out, to induce the growth of side branches. A heavy retentive soil is what Aucubas enjoy. *S.*

HOP FARMERS.—"It is stated on the authority of a Kentish land agent, who is himself a farmer, that agricultural depression throughout that county is becoming more severe than ever. In the Weald a great deal of land is being laid down to grass, and the population of more than one village has decreased by some hundreds. In the neighbourhood of Frittenden and Marden there are at least twelve farms, each about 100 acres in extent, to be let, owing to the tenants giving notice to leave. Rents have been generally reduced to the extent of one-third of the former amount, but nearly every landlord has farms on hand. Hop growers have an enormous quantity of Hops on their hands, being unable to find purchasers even at ruinously low prices. One large grower in East Kent holds no fewer than 2000 pockets of the best Hops, and cannot get a single offer for any portion of them." In your issue of September 26, 1885, you inserted a communication of mine to Messrs. Hooper & Co., of Covent Garden, about Hop shoots. If things are still as bad in the Hop districts of Kent as they are painted in the above extract from the *Standard*, I think it high time that the British Hop farmers

should wake up to the necessity of attending to any suggestions for their benefit made by others. I have just returned from Maidstone, and do not think it is too late to save the present crop of Hop shoots for the London and Brussels markets. British farmers can ill afford to cut them to waste. *E. Belleruche.*

SOCIETIES.

ROYAL HORTICULTURAL.

TUESDAY, APRIL 10.—The meeting of the Committee took place at the Drill Hall, James Street, Victoria Street, Westminster, S.W., on the date above mentioned. Exhibits occupied the entire circuit of the walls, and a long table in the middle of the hall. Trade collections of Narcissi, Cinerarias, and Ferns occupied much of the space, and the miscellaneous exhibits the centre table. The scene was relatively bright, and the plants of much interest horticulturally; but the beholders other than those connected with the Society and the Press were but few.

Scientific Committee.

Dr. M. T. Masters, F.R.S., in the chair. Present: Messrs. MacLachlan, Michael, O'Brien, Ridley, Professor Scott, and Rev. G. Henslow.

Narcissus, fringed.—Professor Scott reported upon his examination of this monstrosity (figured at p. 405), and found that the orientation of the fibro-vascular cords was the same in the outgrowths from the corona as in the perianth leaves, but contrary to the arrangement in the corona itself—*i.e.*, they are normal, with the pith, or bark, on the lower side, and the xylem, or woody portion, on the upper; the fringes alternated with the perianth leaves, giving the impression that they constituted another whorl, so that the tubular parts below the perianth leaves was probably of the nature of a receptacular tube.

Cyclamen, fringed.—Dr. Scott had also examined the specimens exhibited at the last meeting. The petals were not reflexed as in the usual state, but have crowded outgrowths on the inner surface. The cords were reversed on the outgrowths, the orientation of the tracheae and pith being, therefore, just as they are in the corona of Narcissus. There was, however, no great regularity, the tracheae very frequently being quite central.

Dr. Masters observed that similar appendages occur on the outside of Gloxinias, and in them the colour becomes reversed as well. Mr. Henslow called attention to the description of fibro-vascular cords as given by M. P. van Tieghem as being too diagrammatic; that where that author laid stress on the reversal of orientation in the anatomy of pistils it was more general to find the tracheae central, or else surrounded by pith in an irregular manner. This often occurs with the placental cords which supply the ovules.

Cattleya Trianae.—Mr. Smee exhibited a monstrous form, which was referred to Mr. Ridley for examination and report.

Hyacinth Catkins.—Dr. Masters exhibited specimens from M. Sime bearing small female flowers at the base of the male, as well as in the usual terminal position.

Cyclamen with lacinate petals.—Mr. O'Brien exhibited a flower with petals cleft into several lobes, a result, probably, of some degree of impoverishment.

Quercus Skinneri, Acorns.—Mr. T. Christy sent specimens received from Mexico for tanning purposes. They are remarkably large, being from 1 to 1½ inch in length, and three-quarters of an inch in diameter. They were introduced originally about thirty years ago.

Citharexylon latum.—He also forwarded seeds of this plant—also from Mexico. The "nutlets" are oval, plano-convex, and deeply grooved within. They are used for a beverage, which is said to be intermediate in flavour between chocolate and coffee. Certain species of *Lantana*, of the same order, Verbenaceae, are used for Tea; but whether either genus contains alkaloids allied to theobromine or caffeine, is not known.

Floral Committee.

Present: Rev. W. Wilks in the chair; and Messrs. W. Goldring, W. Wildsmith, B. Wynne, H. Herbst, J. Fraser, M. T. Masters, W. H. Lowe, G. Duffield, C. Druery, R. Dean, W. Norman, G. Paul, C. Noble, H. Ballantyne, J. Dominy, H. M. Pollett,

A. H. Lendy, J. O'Brien, E. Hill, Shirley Hibberd, and J. Walker.

Mr. F. Ross, gr. to Sir G. Macleay, Pendell Court, Bletchingly, exhibited flowering sprays of *Bignonia Tweediana*, very abundantly flowered; the flowers are funnel-shaped, on the outside light yellow, and inside of orange. This fine old greenhouse climber should be grown by everyone possessing the necessary accommodation. It will grow well enough in a greenhouse, but it then flowers later, and the flowers do not last so long as when the plant is got into bloom in the spring, by growing it in an intermediate temperature. Flowers of the brilliant-flowered stove shrub *Brownea coccinea* came from the same garden; the colour is crimson, not scarlet, and the flowers form a rather close fascicle.

Some handsome spikes of *Deadrobbium nobile* were shown by Mr. W. Kirk, gr. to Lady Selborne, Blackmoor, Liss.

A bright rose-coloured *Mitonia vexillaria* Emperor Frederick came from W. Cobb, Esq., Silverdale, Sydenham (gr. Mr. Catt), who was awarded a Cultural Commendation. The plant was an example of careful culture.

Mr. T. Bunyard, nurseryman, Ashford, Kent, exhibited flowers of the same dark coloured *Chrysanthemum* which he sent for our inspection recently.

Quite a large collection of various plants well arranged were sent by Mr. B. S. Williams, Paradise Nursery, Upper Holloway. Conspicuous amongst them were two specimen *Adiantums*—*A. colpodium* and *A. atbiopicum* var. *elata*. The former is of an elegant slender habit of growth, with young fronds of a shade of buff—the latter is a tall grower of lax habit; the pinnae bluntly triangular, and the stripes tall black. *Selaginella cuspidata crispata* has an erect dense habit of growth and triangular fronds, arranged in such a way as to greatly resemble a fern. *Cordyle australis variegata* is a form of a well known plant with longitudinal stripes of creamy-white. Many varieties of *Amaryllis* were found in the collection, the newest being Emperor Frederick, scarlet, with rounded segments, strongly reflexed. The pretty *Ochna multiflora*, a few species and varieties of *Orchids*, *Camellia reticulata*; *Yuccas*, *Ferns*, *Crotons*, &c., completed the exhibit. A Silver-gilt Banksian Medal was awarded.

Various heads of flowers of *Clivia miniata*, raised from seeds gathered in South Africa, were shown by Mr. P. Davidson, gr. to Lord Wolverton, Iwerne Minster, Blandford. The colour of the flowers and their size, and that of the corymbs made them equal to the best strains artificially hybridised.

The contribution from Messrs. J. Veitch & Sons' nursery, Chelsea, consisted of *Amaryllis Finette*, *A. Rodney*, a crimson with white bands; *A. Conqueror*, deep crimson banded with green at the base of the petals; *Miss Roberts*, wherein the upper portion of the petals is crimson, and the lower white. The free flowering *Spiraea confusa*, a good-sized example, was shown, likewise *Chionanthus virginicus* (Fringe Tree), in well-flowered, dwarf, worked bushes. The singular-looking white flowers of this plant are something quite apart from the usual run of spring-flowering plants, and should make it to be much sought after by gardeners in search of novelties. *Iris reticulata*, a small collection of *Daffodils*, and the small form of *Narcissus nana*, completed the more prominent plants in this collection.

Messrs. Paul & Sons, The Old Nurseries, Chess-hunt, showed *Labrum alpinum*, a tree in a pot, and densely flowered; *Rosa polyantha*, the single-flowered variety; *R. p. Anna Maria* de Montravel, floriferous, white, in racemes; *Rosa macrophylla*, or *rubra plena*; *Rose Rivers' Musk*, a semi-double flower, in colour pink, and very free; *R. clinophylla plena*, bud filbert-shaped, flesh coloured; a pretty flower. The *Rhododendron Lady Alice Fitzwilliam*, nicely flowered was also shown. (A Silver-gilt Banksian Medal.)

Another good group of *Roses*, which received a similar award, was shown by Messrs. H. Lane & Sons, Berkhamstead, similar to what they showed at the previous meeting. The plants were very well flowered, the best examples being *Madame Charles Wood*, *Ulrich Brunner*, *Magna Charta*, *La Paquerette*, *Mignonette*, *Madame Marie Verdier*, *John Keynes*, and *Madame Lacharme*.

A good group of plants was sent by Mr. J. Roberts, gr. to Messrs. Rothschild, Gunnersbury Park, W., the most observable feature of which was the six bushes in pots of *Rhododendron Lady Alice Fitzwilliam*, a white Indian form, heavily flowered. The bushes were very even and short, 2½ inches in diameter by 2 feet high. A silver-gilt Banksian Medal was awarded.

The Royal Gardens, Kew, contributed an interesting collection of plants, chiefly Primulas, of which we may mention *P. Clusiana*, *P. Porteschlagneri*, *P. Facchini* (a capital plant), *P. marginata* and varieties, *P. pubescens* and varieties. Other plants included *Cistus Clusii*, *Mackaya bella*, and *Rhododendrons Falconeri*, *Campbellii*, and *cinnamomeum*; and *Cineraria cruenta*, interesting as being the original of the florists' *Cineraria*, of which latter a large group of plants, with large well-coloured flowers of good substance, was shown by Mr. J. James, Farnham Royal, Slough. One variety, named Marie, was certificated. It was dwarf and compact, rays white, of great substance and imbricated, violet disc. For the group a Silver-gilt Banksian Medal was awarded.

Mr. Haliburt, gr. to W. Clay, Esq., Grove Road, Kingston, showed a group of *Cyclamen* of good quality and strong, but with rather small flowers. Bronze Banksian Medal. A like award was made to Mr. H. B. May, Dyson's Nursery, Elmouton, for a very pretty group of *Ferns*, the effect of which was very striking. The various forms and shades of the foliage make these plants useful for grouping thus; *Pteris serrulata compacta*, *P. argyraea*, and various forms of *P. serrulata* and *P. cretica*, with *Adiantums* in great variety, formed the major part of the exhibit. *Mignonette* was also sent by Mr. May—very compact plants.

From H. M. Pollett, Esq., Fernside, Bickley (gr. Mr. Parks), there came a fine collection of *Odontoglossums* (all strong pieces) including several good vars. of *O. crispum*, *O. Ruckeriaum*, *O. Andersonianum*, and *O. Wilckeannum*, for which a Silver Banksian Medal was awarded.

Carnations were shown by Mr. C. Turner, Slough. They were Mrs. W. H. Greenfell and Purple King, both of which were certificated by the committee. The flowers of Mrs. W. H. Greenfell are very full, rich flesh-pink; and those of the other variety a dull purple, and also full, with large petals.

Other minor exhibits were *Cattleya Blunti* (a good piece), from Mr. Ballantyne, The Dell, Egham, Surrey; *Mignonette*, with good large spikes, from Messrs. Parker & Sons, St. Michael's Hill Nursery, Bristol.

Messrs. H. Low & Co., Upper Clapton, showed *Boronia megastigma*, *B. m. major*, and *B. m. floribunda*; the last-named is very free in flowering, with flowers of a lighter colour than in the type.

Cypripedium Mastersianum was shown by F. G. Tantz, Esq. (gr. Mr. Cowley); the dorsal sepal is broader than it is long, green, fading to a yellowish hue along the margins; nerves brown; petals 1½ times as long as the dorsal sepal, nearly half an inch wide, red-brown, with black spots at the base; the superior margin has a strange twist just below the apex, making it appear as though a piece had been cut out; lip red-brown with darker markings.

Narcissi.—Daffodils were largely shown by Mr. T. S. Ware, Tottenham: *N. bicolor Horsfieldi* was specially good, and *N. b. Emperor* was represented by flowers measuring about 3½ to 4 inches in diameter; *N. incomparabilis sulphureus* and *N. Golden Spar* were other good examples. Silver-gilt Banksian Medal. The exhibitor also contributed *Anemone blanda*, the blue flowers of which are very pretty; *Iris stylosa var. alba*, white with a suspicion of lilac on the standards—a very desirable object: *Trillium grandiflorum*, *Primula viscosa nivalis*, hardy *Orchids*, &c. A Silver Banksian Medal was also awarded to Messrs. Barr & Son, Covent Garden, for a collection of cut Daffodils and various *Crocuses* in pots. Of the *Narcissi*, Sir Watkin and Barri conspicuous were well shown, and other noticeable forms were *N. cyclamioens*, *N. minor*, *N. cernuus plenus*, *N. Golden Spar*, &c. Messrs. Collins Bros. & Gabriel, 39, Waterloo Road, London, S.E., also showed Daffodils, &c.; *N. pallidus praeox* and *N. obvallaris* were the most plentiful; *N. poeticus*, *N. princeps*, *N. telamoniensis plenus*, &c., were also shown. There were also a number of cut blooms of *Anemone fulgens*. (Silver Banksian Medal).

FIRST-CLASS CERTIFICATES.

To Messrs. Paul & Son, for *Rosa polyantha grandiflora*.

To Mr. C. Turner, for Carnation (tree) Mrs. W. H. Greenfell.

To Mr. C. Turner, for Carnation Purple King.

To Messrs. J. James & Son, for *Cineraria Marie*.

To Mr. B. S. Williams, for *Cordylinc australis variegata*.

To Mr. B. S. Williams, for *Amaryllis Emperor Frederick*.

To Mr. B. S. Williams, for *Selaginella cuspidata crispata*.

To Mr. T. S. Ware, for *Iris stylosa alba*.

To Messrs. Veitch & Sons, for *Amaryllis Rodney*.

To Messrs. Veitch & Sons, for *Amaryllis Fioette*.

To Messrs. Veitch & Sons, for *Amaryllis Conqueror*.

To Messrs. Veitch & Sons, for *Amaryllis Miss Roberts*.

To Mr. F. Ross, for *Bignonia Tweedieana*.

Narcissus Committee.

A meeting of the committee was held in the Drill Hall, James Street, on Tuesday, April 10. The name of the variety registered as Golden Prince was altered to Golden Plover by request. Professor Foster showed *N. calathinus* from Brest and from Spain, drawing attention to the spathe of each; also *Tazetta nobilissima* and *Telamoniensis plenus* (as far as they could be judged) collected in Asia.

A number of selected forms of *Pseudo-Narcissus* were sent or brought from several sources, some claiming to be as early in bloom as *obvallaris*. They were deferred, in order to be tested at Kew; and other varieties received were considered and reported on.

It was stated in the account of the last meeting that *N. minor citrinus* was found to be identical with *pallidus praeox*; this was a mistake, for although the two were thought by some of those present to be very much alike, the question of determining the name was postponed until after those blooms of each should have been examined which are now growing side by side at Kew. *C. R. Swasey Dickens, Hon. Sec.*

LINNEAN.

APRIL 5.—W. Carruthers, F.R.S., President, in the chair. The following were admitted Fellows of the Society:—Messrs. D. Sharpe, J. B. Furmer, and J. A. Voelcker. Mr. G. B. Sowerby was balloted for, and elected a Fellow. Amongst the exhibitions of the evening Mr. D. Morris, Kew, showed a curious native bracelet from Martinique. Although formed apparently of seeds, or beads of wood or bone, its real composition had puzzled both botanists and zoologists, and until microscopically examined could not be determined.

Mr. J. G. Baker, F.R.S., exhibited a series of specimens of *Adiantum Fergusoni* and *Capilluveneris*, and offered some remarks upon their specific and varietal characters. Mr. J. E. Harting exhibited a specimen of a rare British animal, the Pique marten, which had been trapped in Cumberland, and made some observations on the present distribution of the species in the British islands. Mr. Clement Reid exhibited a series of fruits and seeds obtained by Mr. J. Bennie from interglacial deposits near Edinburgh, affording evidence of a colder climate formerly than that now prevailing in the lowlands of Scotland. Mr. F. Crisp exhibited some fragmentary remains of a wild goose shot in Somersetshire, which has been reported as the lesser white-fronted goose, *Anser erythropus*, Linn., but which was apparently an immature specimen of *Anser albifrons*, Scopoli.

In the absence of the author a paper by Mr. A. W. Waters, "On some Ovicells of the Cyclostomatous *Bryozoa*" was read by the zoological Secretary, Mr. W. Percy Sladen, and after an interesting discussion the meeting adjourned to April 19.

Obituary.

JOHN HOLLINGWORTH.—The death of Mr. John Hollingworth, of Turkey Court, Maidstone, took place on Tuesday, the 3rd inst., at the good old age of eighty-two years. In conjunction with his brother Thomas he carried on the important Turkey paper-mills (Whatman's); and these two noble men—renowned for their support of every movement having for its object the good of the town, and for a long course of charitable benefactions carried on in the most unostentatious manner—were worthy successors of the brothers Cheerible. As an amateur rosarian Mr. John Hollingworth had made his mark. His flowers were famous throughout the Southern Counties, and he in his day took many prizes at South Kensington, the Crystal Palace, and elsewhere. For fifty years he had actively promoted the cause of horticulture in

Maidstone, and always took an active part in the work of the Maidstone Horticultural Society. The deceased was laid to rest amid the regrets of all classes, who mourn his loss as a public and private benefactor, and as a good and worthy man.

THE WEATHER.

(Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degree—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

THE PAST WEEK.

The following summary record of the weather for the week ending, April 9, is furnished from the Meteorological Office:—

"The weather has remained in a cold changeable state generally, with occasional showers of snow, hail, or cold rain, interspersed by intervals of bright sunshine. In Ireland and Scotland the showers have been somewhat less frequent than at the English stations.

"The temperature has been again below the mean generally, the deficit ranging from 4° or 5° in Scotland to as much as 9° in 'England, E.' the 'Midland Counties,' and 'England, S.' The highest readings, which were registered on irregular dates, ranged from 58° in 'Scotland, E.' (locally at Ochertyre), 54° in 'England, S.W.,' and 53° in the 'Midland Counties,' to 49° in 'England, E.,' 'England, S.,' 'England, N.W.,' and the 'Channel Isles.' The lowest of the minima, which were recorded on varying dates, ranged from 22° in 'England, E.,' and 23° in 'Scotland, E.,' 'Midland Counties,' and 'Ireland, S.,' to 23° in 'England, N.E.,' and 34° in the Channel Isles.

"The rainfall has been considerably less than the mean in all districts, the amounts measured in 'Scotland, W.,' and 'England, N.W.,' being scarcely appreciable.

"Bright sunshine has been much more prevalent than it was last week, especially over the eastern and southern parts of the kingdom. The percentage of the possible amount has ranged from 25 in 'Scotland, W.,' and 'Ireland, W.,' to 43 in 'England, E.,' 46 in 'England, S.W.,' and 54 in the Channel Isles."

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING APRIL 20. (AVERAGE OF FORTY-FOUR YEARS).

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

EUCALYPTUS COCCIFERA.—Will any of our correspondents inform B. H. Brooksbank where he can obtain plants or seeds of this tree?

NOTICES TO CORRESPONDENTS.

BOOKS: *Handbook of Hardy Trees and Shrubs*. By W. B. Hemsley, is published by Longmans & Co. We do not remember the price.

BRITISH PLANTS, VARIEGATED: *A. B.* Undoubtedly they are not uncommon, but we do not know from experience whether the peculiarity is reproduced from seed. Probably a certain proportion would be.

CAMELLIA: *W. P. & Sons*. Your seedling is very fine, and greatly resembles *C. planipetala*. It is worthy of perpetuation.

CARNATION: *H. H.* Cuttings may be struck now in pots of sandy loam in a hotbed. Do not keep the frame too close, but leave on a little air at night, and shade carefully till rooted. Do not leave the cuttings in the frame a day longer than is necessary. We cannot name the shrub from a leafed shoot only.

CHARLES DOWNING: *F. R.* He was a celebrated American nurseryman, born July 9, 1802, who started a nursery at his native place, Newburgh, New York county, in 1822. He devoted his energies to fruit growing and had one of the most complete fruit nurseries in the United States of America. He died recently, but we cannot now find the record of the event.

CARPET BEDS: *E. P. W.* Apply to Messrs. J. Carter & Co., High Holborn, London; or to Messrs. H. Cannell & Sons, Swanley, Kent.

CÆLOGYNE: *Fastidious*. *Cælog-yne*; or, more correctly, *Kælog-yne*.

CUCUMBER FOLIAGE: *Subscriber*. There is no disease, and we can detect no insects on the leaf and shoots; but these appear to suffer from want of air, and perhaps something deleterious perhaps too much sulphur on the pipes, or ammonia. Examine the roots for the Cucumber thread-worms.

EDGING FOR KITCHEN GARDEN WALKS: *New Hand*. You seem to favour Box for edging, but although it has a nice fresh look, it is the most expensive kind of edging you could employ, seeing that it must be clipped twice a year, mended every year, and relaid about once in six years, and, moreover,

forms a harbour for slugs and other creeping things which occasion loss of garden plants of various kinds. There are edgings now obtainable made in various coloured pottery, and of stone. A good one of the last-named is made of thin (1½ inch) slabs of a description of limestone found in the Isle of Purbeck, and which can be obtained from Swanage at a reasonable rate. It is everlasting, and the slabs being a foot or more in depth, cannot well be displaced if they are inserted five-sixths of their depth in hard soil. Box is suitable for pattern beds on gravel or sand, where the effect of diverse colours is made a point of.

ERRATUM.—In last week's number, p. 423, in "Rose Pruning," for April 1, 2, read March 20, 21.

FAIR MAIDS OF FRANCE: *J. H. S. W.* By this name *Ranunculus acontifolius* is usually understood by Englishmen.

KEITH'S CHALLENGE BOILER: *A Subscriber*. We know nothing personally about this kind of boiler.

LABEL: *W. M. G.* The method is a very good one, but not so easily made by a gardener, as the original label.

NAMES OF FRUITS: *W. Rutley*. It is impossible to name the Apple sent; it is quite out of character now.—*A. Moore*. We are still unable to identify your Apple. It is not of much merit, being deficient in flavour.

NAMES OF PLANTS: *H. Munro*. *Maxillaria ochroleuca*.—*Constant Reader*. *Arum triphyllum*.—*E. W.* *Allium neapolitanum*.—*E. G.* See next week.—*T. H.* Next week; it is not common.—*G. W. R.* *Odontoglossum odoratum*.—*T. D.* *Rhododendron grande*. The *Primula* is very curious, but examination must be deferred for the present. Many thanks.—*E. R.* *Oncidium sphacelatum*.—*Subscriber*. *Myrsiphyllum asparagoides*. *Mrs. Danielson*. *Camellia alba plena*.

SEEDLINGS OF TOMATOS: *J. Oake*. The loss of the plants appears to be due to the close nature of the compost—sea sand and loam—which, when dry, more especially, would form a hard impervious crust over the surface, excluding air from the roots, and possibly causing injury to the tender epidermis of the little plants by contraction following on drying. Cuttings of plants will often die off in exactly the same manner, and apparently from the same cause. The use of sea sand, if unwashed, is not to be recommended for any plants in pots. For Tomatos in the youngest stage of growth the soil used should be light and moderately rich, and the drainage good.

SEEDS: *R. Lowe*. Apparently an *Atriplex*.

UMBELLATE PRIMROSE: *W. J. H.* An ordinary white *Polyanthus* of the fancy type of which there are now hundreds. The pedicels appear to be a little too long to make a symmetrical truss.

WILD PLANT: *T. R.* *Poterium sanguisorba*.

CATALOGUES RECEIVED.

ELLWANOEER & BARRY, Mount Hope, Nurseries, Rochester, New York, U.S.A.—Fruit and Ornamental Trees, Roses, &c.

DIED.—March 27, Mr. GEORGE WILLERS, of the Trumpington Nurseries, Cambridge, at the early age of forty-six years. Mr. Willers, who was well known in the district, was highly respected and esteemed by all who knew him.

MARKETS.

COVENT GARDEN, April 12

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. E.]

TRADE somewhat better, supplies remaining the same as last week. A few samples of new Grapes to hand, but unable to compete with old ones. Prices unaltered. *James Webber, Wholesale Apple Market.*

SEEDS.

LONDON: April 11.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that an active consumptive demand for farm seeds now prevails. Fine Alsikes are held for more money, whilst white Clover and Trefoil, being also in moderate supply, continue very firm indeed. No great quantity of these varieties will apparently be carried over. Italian Rye grass is hardening. Perennials remain unchanged. Red Clover seed also shows no variation, Timothy is dearer. Santoin is scarce, the never very large stocks having melted away. Spring Tares command an advance of 2s. per quarter. Hemp seed is likewise higher. Canary seed is dull. Feeding Linseed steady.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended April 7:—Wheat, 30s. 0d.; Barley, 31s. 0d.; Oats, 15s. 8d. For the corresponding week in 1887:—Wheat, 32s. 8d.; Barley, 23s. 11d.; Oats, 15s. 8d.

FRUIT AND VEGETABLES.

SPITALFIELDS AND COLUMBIA: April 11.—Market firmer for best kinds of Potatoes, without advance in prices. A good general demand continues for vegetables at the following quotations:—Savoys, 6s. to 12s. per tally; Cauliflowers, 4s. to 10s. do.; Brussels Sprouts, 5s. to 6s. per bushel; Broccoli, 2s. to 3s. do.; Spinach, 1s. 6d. to 2s. per sieve; Turnip-tops, 1s. to 2s. 6d. per sack; Curley Kale, 2s. 6d. to 3s. per bushel; Greens, 4s. to 8s. per dozen bunches; Turnips, 3s. do.; Carrots, 2s. 3d. to 3s. do.; English Onions, 11s. to 13s. per cwt.; foreign do., 10s. to 11s. per bag of 110 lb.; Seakale, 1s. 6d. per punnet; forced Rhubarb, 2s. to 3s. per dozen bundles; natural do., 2s. to 3s. do.; Horseradish, 10d. to 1s. 6d. per bundle; Celery 8d. to 1s. 6d. do.; Parsnips, 9d. to 1s. per score; Cabbage Lettuces, 8d. to 1s. 6d. per dozen; Cos Lettuce, 2s. to 3s. do.; Eodive, 2s. do.; Leeks, 2s. do.; Beetroots, 8d. to 1s. do.; English Apples, 4s. to 7s. per bushel; American Apples, 14s. to 22s. per barrel; Mustard and Cress, 2s. to 3s. per dozen baskets; Carrots, 35s. to 50s. per ton; Swedes, 28s. to 32s. do.; Mangel, 20s. to 22s. do.

STRAFORD: April 10.—Quotations:—Savoys, 10s. to 11s. per tally; Greens, 4s. 6d. to 4s. 9d. per cwt.; Carrots, household, 55s. to 60s. per ton; do., cattle feeding, 26s. to 27s. 6d. do.; Parsnips, 6d. to 9d. per score; Mangels, 20s. to 23s. per ton; Swedes, 22s. to 25s. do.; Onions, English, 11s. to 13s. per bag; do., Dutch, 12s. to 13s. per bag; Apples, English, 3s. to 7s. per bushel; do., American, 10s. to 25s. per barrel; Watercress, 6d. to 8d. per dozen; Salads 1s. 6d. to 2s. per dozen baskets; Rhubarb, 2s. to 3s. per dozen bunches; Carrots, 2s. 6d. to 3s. do.

POTATOS.

BOROUGH AND SPITALFIELDS: April 10.—A moderate demand prevails, principally for the better qualities, which about support late value. Supplies are rather increased. Quotations:—Regents, 50s. to 100s.; Magnum Bonums, 50s. to 105s.; Champions, 50s. to 110s.; Dutch Rocks, 50s. to 100s. per ton.

SPITALFIELDS AND COLUMBIA: April 11.—Quotations:—Imperators, 70s. to 80s.; Magnums, 45s. to 90s.; Regents, 65s. to 90s.; Victorias, 50s. to 65s.; Champions, 50s. to 60s.; Beauty of Hebron, 120s. to 140s. per ton.

STRAFORD: April 10.—Quotations:—Scotch Regents, 75s. to 90s.; English do., 60s. to 80s.; do. Magnums, 58s. to 50s.; Fenland, 55s. to 60s. per ton.

ADVERTISERS ARE PARTICULARLY REQUESTED TO SEND THEIR ADVERTISEMENTS AS EARLY AS POSSIBLE.

SANKEY AND SON'S GARDEN POTS.

From Messrs. MARSHALL BROS. AND CO., Barnham and Brighton, Agents for our Pots for Brighton and district.
 "GENTLEMEN.—The last consignment of 16,000 pots to hand in very good condition. We like your pots very much; they are light, and very durable, and we save fully £50 per annum by using them instead of our local pots."
 From Messrs. ARMITAGE AND SON, Nurserymen, Huddersfield.
 "We have used for over twenty years, and are still using and selling, only Sankey's Nottingham-made Garden Pots."

"BULWELL POTTERIES," NOTTINGHAM.

Carriage and Breakage Free on £10 Orders. Half Carriage and Breakage Free on £5 Orders.
 Samples (carriage free) gratis, prices free on application.

From Messrs. HARLEY AND SONS, Dundee and Perth, N.B.
 "We are very pleased with quality of your pots; we grow large quantities of plants for market, and find nice-looking pots make the plants look and sell better; yours are not only superior to others in colour and shape, but are not half the weight, yet stronger, neither do they turn green."
 From Messrs. WALSHAW AND SON, The Nurseries, Scarborough.
 "The pots are so superior over all others we have used that we shall have great pleasure in placing our orders exclusively with you."

£800 saved— A Cash Saving of over £800 in 26 years by the use of WEEKS'S UPRIGHT TUBULAR BOILER.

THE ONLY INDESTRUCTIBLE BOILER.

UPWARDS OF 3000 IN OPERATION.

GUARANTEED CONDITIONALLY FOR TEN YEARS.

A REAL BOON TO GARDENERS

AND SOURCE OF PROFIT TO EMPLOYERS

Mr. CHALLIS, of Wilton House Gardens, writes on April 4, 1888:—

"We still continue to use about one-third or one-fourth chalk (according to circumstances) mixed with anthracite coal for heating the apparatus you fixed here 26 years ago. I think we have now about 8000 feet of piping attached to the two Boilers, only one of which we use at a time, and we find no difficulty whatever in maintaining the required heat in each compartment with this fire, except during the most severe weather, when we use anthracite only. The advantages obtained from the use of chalk are simply that it moderates and conserves the heat, economises labour in stoking, gives me about £20 worth of lime per year for use in the garden, and reduces the coal bill about one-fourth. My experience still convinces me that when properly fixed and well managed, for ECONOMY, SAFETY, and POWER, there is no Boiler used for Horticultural purposes equal to the Upright Tubular."

STATEMENT.

Average Annual Profit by Lime	£20
" " Saving in Fuel	12
" " Total Saving	£32
Saving in 26 years	£832

Weeks & Co.'s Horticultural Structures are equally high class. For full particulars and Coloured Lithographs of Boilers, also 13th Enlarged Edition of Illustrated Catalogue, and particulars of their new Hydro-Chloric Warming and Ventilating Apparatus, post-free, apply to

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,
 Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.
 A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

WANTED, a young Man, as JUNIOR CLERK.—Must have unexceptionable references.—Apply personally at Mr. WILLIAM BULL'S Establishment for New and Rare Plants, 536, King's Road, Chelsea, S.W.

GARDENING APPOINTMENT.

MR. J. T. FLETCHER, late Gardener to J. E. TAYLOR, Esq., Coppins, Iver, Bucks, has been appointed Gardener to S. ROBINSON, Esq., Lynhales, Kington, Herefordshire.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

SCOTCH GARDENERS.—JOHN DOWIE (of the late firm of Downie & Laird), Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Bailiffs, &c.

JOHN LAING AND SONS, having filled many important places, can RECOMMEND with every confidence, energetic and practical MEN of tested ability and first-rate character. Ladies and Gentlemen in want of Gardeners and Bailiffs, or Gardeners for first-rate establishments, or Single-handed situations, can be suited, and have full particulars by applying to us. No fees charged.—JOHN LAING AND SONS, The Nurseries, Forest Hill, S.E.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

E. P. DIXON AND SONS, Hull, can RECOMMEND a few competent HEAD GARDENERS, FOREMEN, and JOURNEYMEN, and will be glad to give full particulars to any Lady or Gentleman requiring the same.

GARDENER (HEAD), where three or four are kept.—Age 28; fourteen years' experience in all branches of the profession. Four years Foreman in present situation.—E. BROOKS, Vicars Hill, Lymington, Hants.

GARDENER (HEAD), where two or three are kept; age 29, single.—J. AMYS, Gardener to the Hon. Mrs. Eliot York, Hamble Cliff, Southampton, can with confidence recommend his Foreman G. Dovey as above.

GARDENER (HEAD).—Age 34, single; thoroughly experienced. First-rate Grape and Plant Grower, and good Kitchen Gardener. Good references.—P. 3, Arney's Cottages, Sutton Common, Surrey.

GARDENER (HEAD).—Age 45, married; thirty years' experience. Thoroughly practical and trustworthy. Eleven years in last and eight in previous situation.—J. R., 55, Percy Road, Kilburn, N.W.

GARDENER (HEAD).—Age 30, married; good knowledge of Orchids, Stove and Greenhouse plants, all kinds of Fruit, Flower and Kitchen Gardening. Would take good single-handed place.—E. ISAACS, Shenfield Road, Reading, Berks.

GARDENER (HEAD); middle-aged.—W. SWAN, late of Fallowfield, is now open to an engagement; thorough practical knowledge of all the branches of the profession; Orchids a speciality. First-class character and testimonials.—W. SWAN, 32, South Meadow Lane, Preston.

GARDENER (HEAD), where one or more are kept.—Age 26; understands general routine Inside and Out. Abstainer. Reference as to character and ability can be had from K. Butler, St. Dunstons, Regents Park, N.W.—J. HARRIS, address as above.

GARDENER (HEAD).—(GEO. BALLANCE, for the last four years Gardener to E. W. Parker, Esq., Skirwith Abbey, Penrith, is open to re-engage. Knows the whole routine of Practical Gardening, and is well up in Rural Improvement, the Renovation of Old Gardens, and the Formation of New.

GARDENER (HEAD); age 29.—Mr. WILKINSON, Gardener to Mrs. Schuster, Cannizaro, Wimbledon, can with confidence recommend a young man, as above, having been with him five years; fifteen years' experience in Vines, Stoves, Kitchen Garden, &c.—LAY, Cannizaro, Wimbledon, S.W.

GARDENER (HEAD).—H. YOUNG, The Gardens, Downside, Stoke-Bishop, Bristol, is at liberty to engage with any Lady or Gentleman requiring the services of a thorough practical man as above. Six years in present situation, previously employed at Chatsworth, Lockinge, and Rolleston Hall. Excellent testimonials from each of the above places.

GARDENER (HEAD).—Age 35, married; twenty years' practical experience in good establishments in Early and Late Forcing of Fruit, Flowers, and Vegetables, the Cultivation of Stove and Greenhouse Plants, Orchids, &c.; also Kitchen Garden and Pleasure Grounds. Five years' good character.—JOHN FINLAYTON, Farnham Royal, Slough, Bucks.

GARDENER (HEAD WORKING).—Married, no family; thoroughly practical in all branches, with first-class references.—H. F., Whittaker's Library, Marina, St. Leonards-on-Sea, Sussex.

GARDENER (HEAD WORKING).—Age 29, married, no family; thorough, practical, and energetic. Very highly recommended.—W. GIBSON, Farington House, Preston, Lancs.

GARDENER (HEAD WORKING).—Thirteen years' practical experience in all branches. Good character.—G. L., The Gardens, Kempshott Park, near Basingstoke, Hants.

GARDENER (HEAD WORKING).—Age 46; no encumbrance. Twenty-eight years' experience in Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants, Flower and Kitchen Gardens. Six years' character.—M., 24, Anatola Road, Highgate, N.

GARDENER (HEAD WORKING).—Married, abstainer. Experienced in all branches, North or South. Six and a half years in last and nine in previous situation. Good character and references.—J. MERRICK, Rosebank, Merton, Surrey.

GARDENER (HEAD WORKING).—Married, no family; experienced in Early and Late Forcing of all kinds of Flowers, Fruit, and Vegetables. Good Orchard Grower. Can be highly recommended.—W. T., 34, Salisbury Road, Highgate Hill, N.

GARDENER (HEAD WORKING).—J. CARROLL, for the last four years Foreman at Woolton Hall, Woolton, Liverpool, seeks a situation as above. Fourteen years' practical experience in leading establishments, thoroughly acquainted with the Forcing of Fruit, Flowers, Vegetables, and the general routine of Gardening. First-class testimonials from above and previous Nobleman's places.—65, Alberton Road, Woolton, Liverpool.

GARDENER (HEAD, OF SINGLE-HANDED).—Age 35; thoroughly experienced in Vines, Cucumbers, Melons, Wall Fruit, Flowers, and Kitchen Garden. Good references. Twenty years' experience.—A. W., Mrs. Hobbs, Birch Street, Nayland, Suffolk.

GARDENER (HEAD, OF SINGLE-HANDED).—Age 36; understands all Branches of Gardening. Good references.—**MR. STEVENS**, 67, Elthorne Road, Holloway, N.

GARDENER; age 32.—**R. SANDERS**, Gardener to A. de Rothschild, Esq., will be pleased to recommend his Foreman, A. French, to any Lady or Gentleman requiring a Gardener. Over six years in present place.—Halton Gardens, Triug, Herts.

GARDENER.—Married, no family; thoroughly understands Gardening in all its branches. Vines, Glass, &c. Sixteen years' experience. Good character from previous and present employer.—**WILLIAM TRIPP**, Station Road, Tynning, Hants.

GARDENER (WORKING); age 30, married.—A GENTLEMAN wishes to very highly recommend his Working Gardener—an exceptionally good Vegetable, Fruit, and Flower Grower, and a thoroughly honest, sober, and industrious man. Understands Management of Cows.—Apply to **R. SAVORY**, Esq., Park Lawn, Weybridge, Surrey.

GARDENER, where another is kept, or good SINGLE-HANDED.—Age 30, married, with family; good knowledge of Stove and Greenhouse Plants, Vines, Flower and Kitchen Garden. Four years in present situation. Good character. Abstainer.—**R. S.**, 15, Russell Terrace, Ravenswood Road, Balham, S.W.

GARDENER (SINGLE-HANDED, OR WHERE help is given).—Three years in present situation. Total abstinence.—**G. P.**, 6, Chestnut Cottages, East Finchley, N.

GARDENER (GOOD SINGLE-HANDED, OR WHERE help is given).—Age 25, married; twelve years' practical experience; highest references.—**W.**, Well House, Well Street, Wrexham.

GARDENER (SINGLE-HANDED), OF SECOND where three or more are kept.—Age 25, married; ten years' experience Inside and Out. Good character.—**ELPHICK**, The Yews, Crawley Down, Sussex.

BAILIFF (WORKING) AND STOCKMAN; married, no incumbence.—A GENTLEMAN can most highly recommend his Working Bailiff and Stockman.—**J. S. PARKHOLME**, Elm Park Gardens, S.W.

HOLLOWAY'S OINTMENT AND PILLS.—A frequent cause of gout and rheumatism is the inflammatory state of the blood, attended with bad digestion and general debility. A few doses of the Pills taken in time are an effectual preventive of acute gout and rheumatism. Anyone who has an attack of either should use Holloway's Ointment also, the powerful action of which, combined with the operation of the Pills, must infallibly effect a cure. These Pills act directly on the blood, which they purify and improve. Having once subdued the severity of these diseases, perseverance with the Ointment, after fomenting the affected joints with warm brine, will speedily relax all stiffness and prevent any permanent contraction.

SALES BY AUCTION.

Wednesday Next.—(Sale No. 7670.)

5000 Grand Bulbs of LILIUM AURATUM, from Japan. MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, April 25.

On view morning of Sale, and Catalogues had.

Wednesday Next.—(Sale No. 7670.)

CYPRIPEDIUMS.—Highly Important Sale. CYPRIPEDIUM HIRSUTISSIMUM, and other grand species. MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, April 25, at half-past 12 o'clock precisely, by order of Messrs. Hugh Low & Co., the finest lot hitherto offered of the rare and lovely CYPRIPEDIUM HIRSUTISSIMUM, equal in condition to the best plants in established collections, amongst them grand specimens, and one marvellous mass with forty-five growths, and measuring 3 feet by 3 feet; also several hundred masses of a grand CYPRIPEDIUM, many with flower-buds, and leaves as finely marked as those of Phalaenopsis Schilleriana, some 10 inches long by 2 1/2 inches wide. Collector writes, it is very much like C. Godefroyae, but believes it is a far better species; flower when stretched out about 4 inches across, the whole flower profusely spotted, on dorsal sepal as much as on the petals and lip. Cypridium in the way of C. Regnierii, splendid masses; Angulosa Clowesii, Aerides crassifolium, the King of the Aerides; Calanthes from Siam, Dendrobium signatum from Siam, producing flowers as large as those of D. aureum, four on a spike from top to bottom of bulbs, 4 feet in length; D. Benouae, D. Devonianum (the Bhamo variety); D. suavisimum, the finest specimens ever offered; Saccobium caeleste, very fine specimens; Vanda corulescens, V. cœrulea, V. Parishii, and other choice ORCHIDS.

On view morning of Sale, and Catalogues had.

Thursday Next.—(Sale No. 7671.)

EXTRAORDINARY MASSES OF CYPRIPEDIUM GODEFROYÆ. MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, April 26, by order of Mr. F. Sander, specially selected by Collector, Grand Masses (probably many of them new) of CYPRIPEDIUM GODEFROYÆ, and a Cypridium with enormous green leaves, found in quite another part, and far away from Godefroyae: these look very distinct and fine.

On view morning of Sale, and Catalogues had.

Thursday Next.—(Sale No. 7671.)

RADIATUM and other extraordinary varieties of ODONTOGLOSSUM VEXILLARIUM. MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, April 26, by order of Mr. F. Sander, a fine lot of ODONTOGLOSSUM VEXILLARIUM, consisting of the finest possible forms.

On view morning of Sale, and Catalogues had.

Sale Thursday, April 26.

DENDROBIUM NOBILE SANDERIANUM, Rehb. f. This is undoubtedly one of the very finest Dendrobium in existence, and a close rival to Dendrobium nobile nobiliss, which it much resembles. It is as large and finer in form, and has a far finer and larger bulb centre. See drawing of this wonderful Dendrobe.

MR. J. C. STEVENS has received instructions from Mr. F. Sander to include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, the entire stock (excepting bulbs kept for propagating) of DENDROBIUM NOBILE, Sander's variety. For beauty and grandeur there are few Orchids in existence to rival this Dendrobe.

On view morning of Sale, and Catalogues had.

Sale Thursday, April 26

A New Species of LADY'S SLIPPER, from New Guinea. CYPRIPEDIUM ROTHSCCHILDIANUM, Rehb. f. Now in flower at the St. Albans Orchid Establishment, and pronounced by those who have seen it, one of the very finest Cypridiums ever introduced.

MR. J. C. STEVENS has been instructed by Mr. F. Sander to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, the entire stock of CYPRIPEDIUM ROTHSCCHILDIANUM.

On view morning of Sale, and Catalogues had.

Sale, Thursday, April 26.

CATTLEYA AUREA. Very Grand Importation. MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, a specially grand lot of CATTLEYA AUREA, just to hand in most superb order. This will be found to be the finest importation ever come to the hammer.

On view morning of Sale, and Catalogues had.

Sale, Thursday, April 26.

2,000 ODONTOGLOSSUM HARRYANUM. MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, a most wonderful importation of ODONTOGLOSSUM HARRYANUM, and undoubtedly the grandest lot that could possibly be brought to this country; the masses are superbly leaved, and marvellous varieties may be looked for. The plants were brought home under the special care of Collector, who describes this lot as containing flowers of enormous size and brilliant colouring; we are sure that nothing like them has previously reached this country.

On view morning of Sale, and Catalogues had.

Sale Thursday, April 26.

At 38, King Street, Covent Garden, W.C. Specially rare and fine ONCIDIUM. ONCIDIUM BIFOLIUM MAJUS. Only once this so beautiful Oncidium has been imported, and the locality in its native country was lost for many years. We have succeeded in rediscovering this fine Orchid, and MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, by direction of Mr. F. Sander, a specially grand importation, in unusually fine order, of ONCIDIUM BIFOLIUM MAJUS. This handsome Orchid has often been eulogised by the Press, and by all to whom it is known. It is, however, so rare, that only one or two old collections of Orchids contain it. The flowers are very elegant, and produced on drooping spikes, large, and sepals and petals are chocolate, marked with yellow, and lip deep golden yellow. It is a plant of most easy culture, and it gives us special pleasure to be enabled to offer such a fine and so rare an Orchid.

On view morning of Sale, and Catalogues had.

Sale Thursday, April 26.

At 38, King Street, Covent Garden, W.C. Very rare and fine ONCIDIUM.—ONCIDIUM SPLENDIDUM. MR. J. C. STEVENS has received instructions from Mr. F. Sander to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, a splendid importation of ONCIDIUM SPLENDIDUM. For many years past we have tried to discover the habitat of this most important Oncidium, and have now succeeded. The flowers are 4 inches long, similar to Oncidium tigrinum, but more lovely. For full description see Catalogue, which may be had in due time of the Auctioneers.

On view morning of Sale.

Thursday, May 3.

Valuable ESTABLISHED ORCHIDS, from a well known private collection. MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 3, at half-past 12 o'clock precisely, a fine lot of choice ESTABLISHED ORCHIDS, comprising splendid plants of Cypridium Sedeni, Spicarianum, Colognye cristata, 1 feet across, Cattleya gigas Normanii, Cattleya exoniensis, part of original plant, Oncidium marianthum, Masdevallia Chelsoni, Veitchii, Lælia purpurata, 18 in pan, Masdevallia bella, and a number of M. Harryana, including several splendid specimens in 12 and 16-inch pans, and comprising the very finest varieties.

On view morning of Sale, and Catalogues had.

The Valuable Collection of Orchids formed by the late John Day, Esq., of Tottenham.

MR. J. C. STEVENS begs to announce that he has been favoured with instructions from the Executors of the late John Day, Esq., to SELL by AUCTION, without the least reserve, at his Great Rooms, 38, King Street, Covent Garden, W.C., his entire Collection of ORCHIDS, consisting of the choicest species and varieties, and including many plants of exceptional interest. Amongst other varieties will be found a grand collection of the rarest and choicest CYPRIPEDS, in the finest health. The First Portion of this Collection will be SOLD on WEDNESDAY and THURSDAY, May 9 and 10. N.B.—For fuller particulars, see Gardeners' Chronicle, March 24.

Sale Thursday, May 24, Without Reserve.

At 38, King Street, Covent Garden, W.C. CATTLEYA LAWRECEANA, specially large and fine flowered variety. See dried flowers.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 24, by order of Mr. F. Sander, a specially large and grand importation of CATTLEYA LAWRECEANA. This consignment has been collected in a quite different district, from whence no Cattleya Lawrenceana have ever been introduced. There is as much difference between this and the ordinary C. Lawrenceana as there is between the starchy variety of Odontoglossum crispum and the broad petalled forms. The dried flowers on view will give some idea of the magnificence of this variety.

On view morning of Sale, and Catalogues had.

Special Sale on Monday Next, April 23.

CATTLEYA LAWRECEANA. A wonderful importation collected and brought home by M. J. D. Osmer, now in the very best possible condition, scarcely a plant having lost a single leaf on the journey.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on MONDAY NEXT, April 23, at half-past 12 o'clock precisely, without reserve, a magnificent importation of the beautiful CATTLEYA LAWRECEANA consisting of about 600 plants. They were collected at the proper time when in flower by Mr. J. D. Osmer, and brought over under his special care. The whole will be found to be in the very best possible health and condition with perfectly sound and firm roots and full of green leaves. Amongst the importations will be found numerous splendid masses and very fine varieties, one being specially marked as having very light rose coloured flowers. The Sale will also include about 150 lots of well-grown ESTABLISHED ORCHIDS and a small importation of various ORCHIDS received direct from the Brazils.

On view morning of Sale, and Catalogues had.

Tuesday Next.

CARNATIONS and PICOTEES, a first-class collection of the best varieties; 500 Standard and Dwarf ROSES, selected FRUIT TREES, Hardy EVERGREENS, RHODODENDRONS, HERBACEOUS PLANTS, CLIMBERS, and GREENHOUSE PLANTS.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at the City Auction Rooms, 38 and 39, Gracechurch Street, E.C., on TUESDAY NEXT, April 24, at half-past 12 o'clock precisely.

On view morning of Sale. Catalogues had at the Rooms, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Tuesday Next.—Orchids in Flower.—Special Sale.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., TUESDAY NEXT, April 24, at half-past 12 o'clock precisely, about 300 lots of ORCHIDS in FLOWER, from various collections, amongst which will be found the following:— Cattleya Mendelii, very fine specimen and variety; Masdevallia Veitchii grandiflora; Cattleya Mossie, grand specimen; Odontoglossum Harryanum; Dendrobium nobile nobiliss; Odontoglossum Wilckeanum; Dendrobium nobile Cooksoni; also very fine varieties of Odontoglossum Alexandre, O. Rossi majus and O. vexillarium, Cattleya Lawrenceana, Lælia purpurata Russelliana, and many others.

On view morning of Sale, and Catalogues had.

Wednesday Next.

10,000 LILIUM AURATUM, splendid Bulbs, from Japan. An importation of 25,000 FRESIA REFRACTA ALBA, VALOTTA PURPUREA, true; DISA GRANDIFLORA (tubers), BRUNSVIGIAS, VELTHEMIAS, and other CAPE BULBS; 20 specimen SEAFORTHIA ELEGANS, COCOS WEDDELLIANA, and other PALMS, very suitable for decorative purposes.

MESSRS. PROTHEROE AND MORRIS will include the above in their SALE by AUCTION, at their Rooms, on WEDNESDAY NEXT, April 25, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Wednesday Next.

LILIUM AURATUM from Japan, Collection of the beautiful Japanese MAPLES, a choice assortment of English-grown LILIES, including most of the best varieties in cultivation; GLADIOLI, GREENHOUSE PLANTS, in variety; Standard and Dwarf ROSES, HERBACEOUS PLANTS, CARNATION, PICOTEES, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on WEDNESDAY NEXT, April 25, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Wednesday Next.

SALE OF STOVE and GREENHOUSE PLANTS, &c., from SAMPLE.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on WEDNESDAY NEXT, April 25, at half-past 12 o'clock precisely, a large quantity of GREENHOUSE PLANTS, from sample—1600 Dentzia gracilis, 200 Escallonia Ingers, 200 Garrya elliptica, 100 single white Macartney Roses, 300 Pinks, Mrs. Sinkins; 500 Cloves, Carnations, White Perfection; 500 Hollyhocks, fine named sorts; named Carnations and Picotees, Herbaceous Calceolarias, &c. Samples will be on view on the morning of Sale. Catalogues forwarded on application to the Auctioneers, 67 and 68, Cheapside, E.C.

Kingston-on-Thames.—Without Reserve.

Important to Exhibitors, Gentlemen, Florists, and others. The whole of the well-known collection of Specimen Exhibition STOVE and GREENHOUSE PLANTS, which have taken so many Prizes at the leading Metropolitan and Provincial Shows, by order of Messrs. T. Jackson & Son, who have given up exhibiting.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL by AUCTION, on the Premises, The Nurseries, Kingston-on-Thames, adjoining the Railway Station, on THURSDAY, April 26, at 12 o'clock punctually, without reserve, the above valuable COLLECTION of EXHIBITION PLANTS, amongst which will be found numerous very fine specimen and half-specimen Azaleas, specimen and half-specimen Ericas in great variety, Greenhouse Rhododendrons, Ixoras, Anthurium Schzerianum, Lapagerias, specimen Hardy Ferns, specimen Palms, and other Decorative Plants. May be viewed three days prior to the Sale. Catalogues obtainable on the Premises, and of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C., and Leytonstone, E.

Friday, April 27.—Established Orchids.

A portion of the well-known collection of ESTABLISHED ORCHIDS, by order of C. Dorman, Esq., of The Firs, Laune Park, Sydeham, who is making alterations to his Greenhouses, necessitating the disposal of some of the Plants.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from C. Dorman, Esq., to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, April 27, at half-past 12 o'clock precisely, a portion of his well-known collection of ESTABLISHED ORCHIDS, amongst which will be found the following valuable plants:— Lælia purpurata, magnificent plant, 142 bulbs, 22 leading growths, 12 sheaths; Cattleya exoniensis, good plant; Reineckiana superba, true; Wagnerii; Lælia euspatha; Cymbidium Parishii, good; Cymbidium pendulum atropurpureum, very fine plant (rare); Vanda Sanderiana, 4 leads plant, good variety, 4 leads; Cymbidium insigne Wallacei; Dendrobium Leachianum; Dendrobium nobile Cooksoni.

On view morning of Sale, and Catalogues had.

Friday Next.

IMPORTED ORCHIDS. MESSRS. PROTHEROE AND MORRIS will include in their SALE, at their Rooms, on FRIDAY NEXT, April 27, by order of Mr. F. Sander, a large quantity of Imported ORCHIDS, including Cattleya Mossie, Odontoglossum Phalaenopsis, Angreecum Sanderianum, Vanda teres, also, another property, a few well established plants of Phalaenopsis Brassia species, and Dendrobium thyrsiflorum.

On view morning of Sale, and Catalogues had.

Sales by Auction continued on p. 484.

SPECIAL SALE ON MONDAY NEXT, APRIL 23.

CATTLEYA LAWRENCEANA.

A wonderful Importation, collected and brought home by Mr. J. D. Osmer, now in the very best possible condition, scarcely a plant having lost a single leaf on the journey.

MESSRS. PROTHEROE & MORRIS are instructed to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **MONDAY NEXT**, April 23, at half-past 12 o'clock precisely, without reserve, a magnificent importation of the beautiful

CATTLEYA LAWRENCEANA, consisting of about 600 plants.

They were collected at the proper time, when in flower, by Mr. J. D. Osmer, and brought over under his special care. The whole will be found to be in the very best possible health and condition, with perfectly sound and dormant eyes, and full of green leaves. Amongst the importation will be found numerous splendid masses, and very fine varieties, one being specially marked as having very light rose-coloured flowers.

The Sale will also include about 150 lots of well-grown ESTABLISHED ORCHIDS, and a small importation of various ORCHIDS received direct from the Brazils.

On view morning of Sale, and Catalogues had.

THE LAWSON SEED AND NURSERY CO., LIMITED (IN LIQUIDATION), BANGHOLM NURSERIES.

The FOURTH and MOST IMPORTANT of the Great CLEARANCE SALES

WILL TAKE PLACE ON

THURSDAY, FRIDAY, and SATURDAY, April 26, 27, and 28, at 11 o'clock Forenoon each day.

MR. DAVID MITCHELL, HORTICULTURAL AUCTIONEER, has been favoured with instructions from the Liquidators to SELL by PUBLIC AUCTION, a further portion of the VALUABLE NURSERY STOCK belonging to the above Company, at the BANGHOLM NURSERIES, FERRY ROAD, and INVERLEITH ROW, EDINBURGH.

The Stock to be offered for Sale comprises a fine lot of ORNAMENTAL EVERGREEN and DECIDUOUS TREES and SHRUBS of all sizes, for Park and Villa decoration; and at this Sale will be specially offered MANY THOUSAND HOLLIES of all the well-known varieties, comprising Golden Queen, Silver Queen, Gold and Silver Variegated, Moonshine, Nobilis, Hodgensi, Donningtonensis, &c., &c. The Hollies are in sizes suitable for immediate effect in many times transplanted Specimens, and also in all sizes from young Nursery Plants upwards. There will also be offered Fine Coniferæ, Golden Yews, Abies Douglasii, Picea nobilis, Picea Nordmanniana, and some fine plants of QUERCUS PANNONICA, &c., &c., &c.

This Nursery has for nearly half-a-century been famed for Hollies, and the attention of Purchasers is particularly drawn to this stock, which is in the finest possible condition for transplanting, the present time being eminently suitable for the purpose.

On the Second Day of the Sale there will be offered the whole stock of the splendid New Golden Variegated HODGENS HOLLY, which originated in the Bangholm Nursery, consisting of Twenty-four Plants together with the original plant of Ilex Hodgensi from which the first grafts were taken. This lot comprises the whole stock, which is therefore unique, and will be a valuable acquisition to any Nursery.

Descriptive CATALOGUES are in preparation, and may be had on application to Mr. W. E. DIXON, the Manager, Bangholm Nurseries; or to the Auctioneer, 6, Comely Bank, Edinburgh. Cars pass the Nursery every ten minutes.

67, George Street, Edinburgh, April 17, 1888.

GEO. TODD CHENE, C.A., } Liquidators,
JOHN SCOTT TAIT, C.A., }

The Final Sale will take Place on May 3, 4, and 5.

WEDNESDAY NEXT.—Sale No. 7670.

CYPRIPEDIUMS.—HIGHLY IMPORTANT SALE.

CYPRIPEDIUM HIRSUTISSIMUM and other grand species.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, April 25, at half-past 12 o'Clock precisely, by order of Messrs. Hugh Low & Co., the finest lot hitherto offered of the rare and lovely CYPRIPEDIUM HIRSUTISSIMUM, equal in condition to the best plants in established collections, amongst them grand specimens, and one marvellous mass with forty-five growths, and measuring 3 feet by 3 feet; also several hundred masses of a GRAND CYPRIPEDIUM, many with flower-buds, and leaves as finely marked as those of Phalenopsis Schilleriana, some 10 inches long by 2½ inches wide. Collector writes it is very much like C. Godefroyæ, but believes it is a far better species; flower when stretched out about 4 inches across, the whole flower profusely spotted, on dorsal sepal as much as on the petals and lip. CYPRIPEDIUM in the way of C. Regnieri, splendid masses; ANGULO CLOWESI, AERIDES CRASSIFOLIUM, the King of the Aërides; CALANTHES from Siam, DENDROBIUM SIGNATUM from Siam, producing flowers as large as those of D. aureum, four on a spike, from top to bottom of Bulbs, 4 feet in length; D. BENSONIÆ, D. DEVONIANUM (the Bhamo variety), D. SUAVISSIMUM, the finest specimens ever offered; SACCOLABIUM CÆLESTE, very fine specimens; VANDA CÆRULESCENS, V. CÆRULEA, V. PARISHI, and other choicé ORCHIDS.

On view morning of Sale, and Catalogues had.

Without Reserve.—Sale Thursday Next. April 26.

MR. J. C. STEVENS has received instructions from Mr. F. SANDER to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, April 26, at half-past 12 o'Clock precisely:—

THE NEW CYPRIPEDIUM ROTHSCHILDIANUM, RCHB. F.

THE NEW DENDROBIUM NOBILE SANDERIANUM, RCHB. F.

SPLENDID RADIATED VARS. OF ODONTOGLOSSUM VEXILLARIUM.

THE VERY RARE ONCIDIUM SPLENDIDUM.

THE MAGNIFICENT ODONTOGLOSSUM HARRYANUM.

THE NEWLY RE-INTRODUCED ONCIDIUM BIFOLIUM MAJUS.

Also specially selected masses of ODONTOGLOSSUM BLANDUM, O. PESCATOREI, O. GRANDE, &c., together with a grand lot of CATTLEYA AUREA and other Magnificent ORCHIDS.

On view morning of Sale and Catalogues had.

NEW EDITION, CORRECTED UP TO DATE.

 Descriptive LIST on application.
ISAAC DAVIES & SON,
 NURSERYMEN, ORMSKIRK, LANCASHIRE.

well, although it had to fight for existence with the numerous "cormorant" roots of the Bamboos which latter usually starve or kill everything in their proximity in my garden. After hesitating two or three years it became firmly established, and then began to grow with amazing rapidity and strength. In fifteen years it clothed three sides of the tower, 66 feet in height, with a most luxurious vegetation, waving branchlets in the air in every direction.

It was a lovely sight, admired by all who saw it, and I was delighted with my African friend, whose presence and efforts to clothe my old tower I welcomed with enthusiasm. He grew and grew winter and summer, at all seasons, day and night. The more we cut him back the more vigorous he became. Three sides of the tower had disappeared in a covering of thick Ivy branchlets and foliage; indeed, all but the southern facing, which he seemed to avoid.

My enthusiasm received, however, a sudden and severe check. The inner walls of an annexed building, which he had also covered, above 2 feet thick, became damp; the mortar peeled off, and, lo and behold! the Ivy appeared inside, after having pierced through this thick wall in many places. This fact made me anxious. I examined the tower carefully, and found that my friend had taken possession of it, and was actually eating it up; numerous branches, not mere roots, had pierced it between the stones, and were living on the old mortar. I had given hospitality evidently to a terrible parasite, who was rewarding me by eating up my very vitals. With a sigh on leaving last spring I gave orders to have him cut at 20 feet from the ground, and rooted up. Underground we found roots as thick as a man's thigh, which appear to be usually the case with these luxuriant Southern climbers. He had beaten the Bamboo, invaded the garden in every direction, and was destroying the old tower, and that rapidly. I gave directions to my gardener to leave the upper 40 feet intact, to see what would take place.

On my return four months later, I found the upper 40 feet of the Ivy on the tower as flourishing as ever. It did not appear to have suffered in the least from the mutilation it had undergone, from having had both roots and trunk cut away. It was growing on, as green as ever, clearly living on the mortar of the tower by the roots it had sent into every jointure. This I had seen before. I had observed a small Ivy growing on a wall, alive and flourishing, in a sun-exposed situation, on a new wall, years after its roots and stem had been cut away.

This experience opened my eyes to the danger I was running. I had the Ivy ruthlessly torn off the tower, and cemented all the old joints of the stonework from top to bottom on all four sides. Henceforth I shall follow the Southern system, and allow no parasitic vegetation of any description to exist on the walls of my tower, and let it raise its head to the sky naked and forlorn, as is the case with all public monuments in the South. All who have travelled, if they will consult their memories, will recollect that they have never seen Ivy on public monuments in the South. My experience is clearly that of all time, and the danger of parasitical plants to buildings, old or new, is so generally acknowledged in the South, that they are never allowed. In England, in a minor way, the same thing must take place.

I take this opportunity to ventilate a conceit, and to ask a question. Does Ivy ever attach itself to a shrub or tree with thorns, say to a Rose tree? I cannot recollect such a fact in gardens, woods, and hedgerows, and several friends whom I have questioned say the same. Is it so?—for if it is, the Ivy, the parasite, has more sense (instinct) than human beings, who are constantly attaching themselves to those who have moral thorns, concealed or open, and once so attached as they cannot untwine, without getting lacerated and mangled as the results. *Henry Bennet, M.D., Torre di Grimaldi, Ventimiglia.*

ORCHID NOTES AND GLEANINGS.

LÆLIA FLAVA, Etc.

A distinct and closely related group of *Lælia* is formed by this species, *L. cinnabarina* and *L. harpophylla*. All three are Brazilian, the two first having been introduced forty or fifty years ago, while the last made its appearance in 1873. *L. flava*—the one perhaps least often met with—I saw a few days ago, flowering very prettily in the Messrs. Veitch's establishment at Chelsea. The flowers, of which there were six or seven on the spike, measured 3 inches across and were of an exceedingly bright yellow colour, the only variation being a few faint crimson lines along the side lobes of the lip. The pseudobulbs are ovate, and bear one or two thick, very leathery and purplish-tinted leaves. The unusual colour of the flowers, which is perhaps most nearly approached in Orchids by those of *Masdevallia Davisii* renders this a very desirable plant. *L. cinnabarina* is similar in habit to the above, but may be recognised by the more elongated, stem-like character of its pseudobulbs. The sepals and petals have a more acute shape, and the entire flower is of an orange-scarlet colour. *L. harpophylla*, the freest flowering and most useful of the group, has also bright orange-scarlet flowers, and a white blotch on the lip; it is readily distinguishable by the slender terete stems, which are 10 to 12 inches in height.

These *Lælia*s require to be grown in good peat-fibre, with a small addition of sphagnum and crocks, and succeed best in a light airy position in an intermediate-house. The growths should be well ripened off in autumn, otherwise there is a tendency during the dark, foggy weather which follows for the pseudobulbs to decay, especially those of *L. cinnabarina*. Whenever decay makes its appearance the part affected should be cut out, and flowers of sulphur rubbed over the wound.

SELENIPEDIUM GRANDE.

This striking hybrid—better known, perhaps, as a *Cypripedium*—is one of the many products of Mr. Seden's skill and is now flowering in the Kew collection. Its parents are *Selenipedium Rœzlii* and *S. caudatum*; and it bears a considerable resemblance to the former in the general aspect of the flowers. They are, however, giants compared with those of *S. Rœzlii*; and the side petals become upwards of a foot in length, and show strikingly the influence of *S. caudatum*. A notable feature of the plant is the size of its leaves, these being when fully developed 2½ feet in length, and 2½ inches in width. Even when out of flower well-grown plant is a striking object.

LYCASTE SKINNERI.

For its size this Orchid is probably capable of producing more flowers than any other. We have now a plant bearing from a single pseudobulb no less than fifteen large and fully opened flowers. This fact may be worthy of mention, because during the last three years the plant has been systematically treated with fish-manure when in active growth, and at the commencement of that period the pseudobulb was little larger than a pigeon's egg, and produced but three flowers. A good method of applying this manure is to make about half a thumb-potful into a paste, and then mix it with four gallons of water. This proportion may be given from once a fortnight to once a month, according to the character of the growth, and only during the growing season. It is said that the systematic use of this kind of manure is apt to induce an apoplectic condition in the Orchids to which it is given, and that they are finally liable to "go off" very rapidly, but during the last years I have used it for *Lycastes*, *Pleiones*, *Anguloas*, and similar gross feeding Orchids, with entirely beneficial results. *W. B.*

MASDEVALLIA CULEX.

Mr. F. W. Moore, of Glasnevin, has been good enough to send me a specimen of this plant, which

proves to be *Pleurothallis macroblepharis*, as I indicated probable a week or two ago. Both the pieces which have come into my hands have proved to be this, though it is quite likely that *P. Barberiana* may also have been distributed under the name, as Mr. O'Brien (to whom I am much obliged for his reply) indicates. In the first case I found the name written *pulex*, and both ways of spelling would have appeared in my note but for a misprint. I may add, that I hope these spurious names, which should never have been given, will be allowed to drop at once, and thus avoid more confusion.

TRIAS PICTA.

A plant of this rare and interesting little gem is now in flower in the Kew collection. It is planted on a small piece of Tree Fern stem, and is in robust health in the warm division of the Orchid-house. It forms a compact mass not 3 inches high; the pseudobulbs are shortly ovoid, with four rounded angles, and the fleshy leaves narrowly ovate, with an acuminate apex. The fleshy flowers are about three-quarters of an inch across, honey coloured, densely spotted with light reddish-purple spots, and borne on the shortest possible stalks. It is a native of Burmah, where it was discovered by the Rev. C. E. Parish. It figures as *Bulbophyllum (Trias) pictum*, Par. and Rehb. f., in the enumeration of Moulmein Orchids in the *Transactions of the Linnean Society*, vol. xxx. But as *Trias* is considered a distinct genus in the *Genera Plantarum*, and as the habit is so distinct, it may as well stand as above. *Trias oblonga*, the other species of the genus, is another little dwarf, which is occasionally met with in collections. *R. A. R.*

CÆLOGYNE CRISTATA.

The plant of *Cœlogyne cristata*, of which we give an illustration (see fig. 68, p. 489), is that known as the Chatsworth variety, and was grown in Mr. W. Lee's garden, Downside, Leatherhead. Mr. C. Woolford, the very successful cultivator of Orchids at Downside, supplies the following particulars:—"The plant in question is kept in the Cattleya-house all the year round, and measured when photographed more than 7 feet across. It has not been potted for three or four years, and has so overgrown the pan (24 inches diameter) in which it stands, that the latter is almost hidden from view."

This form of *Cœlogyne cristata* is one of the best in cultivation; the pseudobulbs and foliage are of a darker green colour than most other varieties; each spike bears from six to nine flowers, of a large size, and the colour is of the purest white.

Cœlogyne cristata is a native of Northern India, and was first flowered in this country by Mr. George Barker at Birmingham in 1841. The Chatsworth form of *cristata*, although very fine, is said by Professor H. G. Reichenbach to be inferior to *C. c. var. maxima*.

DAFFODILS.

The following remarks on Daffodils were made by Mr. J. Walker, of Whitton, Middlesex, on the occasion of the meeting of the Horticultural Club on Tuesday, April 10, inst., at the Hotel Windsor, Victoria Street, Westminster:—

When I agreed with our Secretary at our annual gathering in January, to read a paper on Daffodils, I then expected to have had a much larger number of varieties to put before you, but "the best laid schemes o' mice and men gang aft a-gley," especially when one has to depend on the elements. I daresay you are all aware of the opinion that prevails that we have too many varieties of the Daffodil, under names, and to some extent this is true. I observed one writer advocates ten varieties as being sufficient; on the other hand, Mr. Barr, in his *Book of Daffodils*, out of 185, has no less than 102 varieties of single-flowered *Incomparabilis*—two extremes, seeing that they commence to flower in ordinary seasons in February, and continue until the

end of May, and ten varieties would only give one variety in ten days. If there is to be a Royal Horticultural Society Daffodil Committee, and if each individual is to exercise his discrimination, there will be plenty of scope for him: indeed, the number of good varieties is so large, that I will now confine my remarks to those only which may be considered the commercial varieties of the Trumpet-flowered section.

If we take the yellow forms first, I fear we shall have to pass by the English Pseudo-Narcissus, few if any of these succeeding under cultivation. Of the light yellow Narcissus, Emperor stands alone, and it has as yet no rival; and if we look at the deep yellows, the same may be said of *Narcissus maximus*. Both these varieties will be hard to beat.

cutting my beds of *Horsfieldi*, *Empress* commences to bloom; and when *Empress* is passed, *grandis* begins—these three varieties giving flowers for a period of about one month. To this section may be added Dean Herbert, J. Walker, M. Foster, J. B. M. Camm, and Mrs. J. B. M. Camm—all interesting flowers, quite distinct, and worthy of a place in any collection.

Although the white Narcissi are very pretty, they are not found so valuable for marketing as the yellows or bicolors, they being much more difficult to grow. Of the hybrids, Mrs. W. F. Burbidge is entitled to the first place: the flower is of fine form and substance, possessing likewise a good constitution. Next come Mrs. Thompson and Dr. Hogg, *cernuus pulcher*,

will be found that there are not two flowers alike; it seems as if each one was a seedling, whereas the flowers of our Tenby variety are all so much alike that it would lead one to suppose they had all originated from one bulb. It may be worth our while to inquire if we obtain any of our varieties from reversions, I for one believe that we do; some persons are of the contrary opinion. It may be very difficult to get direct and trustworthy evidence on this point, although strong circumstantial evidence can be produced. I believe a change rarely takes place in the progeny of bulbs of one's own growing, but rather from bulbs received from outside sources that have been grown for a long time in soil altogether different in its nature from one's own. It

FIG. 63.—*CÆLOGYNE CRISTATA*, CHATSWORTH VARIETY. (SEE P. 488.)

I will now name a few in their order of flowering:—Tenby, Ard-Righ, Troilus, Henry Irving, Golden Spur, General Gordon, Captain Nelson, J. G. Baker, Blondin, Vicar of Lulworth, Hudibras, Edward Leeds; and there are doubtless many more which could be mentioned that are as good. Of those that resist the wind, sun, and rain best, are the Tenby and Troilus; the last named variety was introduced by our friend Mr. Wilks, who says that it has no origin, but is like the parson's calf which came alive. Those which possess the finest formed trumpets are J. G. Baker, and Captain Nelson. If we now take the bicolor section it will be very difficult to say with which variety we should lead off—*Empress*, *Horsfieldi*, and *grandis*, seem to have an equal claim, although, on heavy land, *Empress* will beat *Horsfieldi*, whereas on light land the order is reversed. I find that when I have about half done

Wm. Goldring, F. W. Burbidge—all very good varieties. Of those that are not known to be hybrids, I have not the slightest hesitation of placing our English *cernuus*, or what Hartland calls Bishop Mann; first it is a model flower, and stands well when cut. Of this class *cernuus Niobe* and *Colleen Bawn* are exquisite examples. The one which I should like to take next is *Leda*. In mentioning this variety I am aware of treading on delicate ground, as Mr. Barr challenges its name by calling it his *tortuosus*; but this I am certain of, that what he gave me in 1882 as *tortuosus* is not Mr. Hartland's *Leda*.

This is a question that cannot be settled by any one person, but may be decided when we learn the results of certain trials that are being made at various places. Before bidding good-bye to this section let us consider *N. pallidus præcox*, and it

would seem that it is when the bulb receives a violent change, the old blood is set a going. Mr. Dickson's opinion about a Sir Watkin is that the bulbs he received in 1884 had been grown in the same place for quite eight or ten years. Those I obtained were planted in soil that had been broken up about two years previously and had been meadow-land for a long course of time. When they had flowered in 1885 we got one flower with an orange cup, which we call *Lady Wynn*. The same may be said of Mrs. Thompson, which I contend is a short form of *cernuus pulcher*.

I have no doubt that the bulbs grew in the Aldborough Rectory garden from the time Leed's collection was divided, until the time of Mr. Nelson's death. It would appear that the greater length of time the bulbs are grown in one place, before being removed and planted in soil of a

different nature, the greater the change which is likely to take place.

With regard to the treatment of Narcissi this is very varied, seeing that the plants come from so many different parts of the world. As regards the depth at which they should be planted, much will depend on the nature of the soil, and the size of the bulb, but it is very certain that a bulb planted 6 inches deep will not make root so readily or so strongly as one planted only 2½ inches deep. As a rule the bulbs may be planted deeper on light land than on one that is heavy in its nature; again, if they are to remain more than one year in the ground, they should be planted somewhat deeper than if they are to remain but one season, the bulbs tending to grow upwards, and on wet land it would be advisable to raise the beds by throwing out alleys. I should consider 3 inches of soil on the top of the larger bulbs, and 1½ inch over the smaller ones, a fair depth.

With regard to the time to plant, the careful cultivator will soon discover that this also varies with the variety. I have planted Poeticus in June when the foliage was green; and the finest bed of yellow Hoope-ticoat that ever I grew was planted in February; however, it would be wise to have all planting over by the end of September, so that the bulbs may have time to make plenty of "fibre" before winter sets in, and such will come up much stronger than those planted later.

The time of lifting is also varied, but there is no safer guide than to lift as the foliage of each variety begins to die off, and when lifted they should never be allowed to be exposed to the sun or rain, but be placed on trays in an open airy shed, allowing whatever soil that may adhere to the bulb to remain until they are cleaned. I wish to lay particular stress on the matter of storing after having been cleaned, for if they are then placed in bulk they will become mildewed, and, if spread out, they also get deteriorated.

The more one studies them the more it will be found that there is an individuality about each one of them which must be taken into consideration, and it will be found that some varieties will require to be lifted every year, while others may remain in the same spot for a number of years and do well. If it were not for the labour and expense it would entail I would lift all my bulbs every year; and if this method was practised I have no doubt there would be fewer complaints about "rust."

I do not know if any one of you may have observed that a stray bulb growing with another variety will invariably do better than when in a bed of its own sort. If this be so it goes some length to prove that one variety takes something out of the ground which another variety does not. I think that most of you will agree when I say, that hybrids are much easier cultivated than species, or naturalised hybrids, though amongst the latter are some of varieties as easily cultivated as the former. Of the hybrids; the two I find the most difficult to grow and to multiply, are Dr. Hogg and J. G. Baker.

Now I do not know who is responsible for naming these two weak varieties after two gentlemen possessing so much—what shall I call it—fibre, grit, or will?—but I have a strong opinion that there should be some trace of the quality of the individual in the flower.

As an instance of this incompatibility, Mr. Barr in his book of 1885, has a single incomparibilis that he calls "Wellington;" now, imagine an incomparibilis with a flimsy perianth, and called Wellington!

Now, practically with all that can be said, or done, there is no hard and fast line to be laid down, as may be done with the cultivation of Anemones, Ranunculus, Tulips, Dahlias, &c.; but I am convinced the day will come when Daffodil growers, will be as anxious to change their bulbs as farmers now are to change their seed Wheat or seed Potatos; and if each individual interested in Daffodil work would contribute his experience to a sort of general fund, we should soon come to a still better understanding with our friends the Daffodils.

FLORISTS' FLOWERS.

THE AURICULA.

THIS will undoubtedly be a late season, even should the weather change considerably for the better; but as far as I can judge from my own collection and what I hear from growers in the North, the prospects of a good bloom are excellent. I hope members of the National society will do their utmost to bring up as many plants as possible to the exhibition on April 24 at the Royal Scottish Volunteers Drill Hall, James Street, Westminster. Nearly all Auricula growers have heated houses now, where they can keep the cold from their plants; and if this has been done since January, the plants will doubtless be in good condition. In such seasons as the present the flower-trusses of the show varieties are generally much drawn up, owing to heating the house and neglecting to ventilate sufficiently. The best house for Auriculas is a low span-roofed one, and the plants ought to be arranged as close as possible to the glass; moreover, night and day the ventilators ought to be open a little to ensure a constant circulation of air. We have a row of cast-iron "hit and miss" ventilators in the walls opposite the hot-water pipes; and these are kept open even in frosty weather, but the cold air is warmed as it passes over the pipes, and filters up amongst the plants on the stages. On the mornings of fine days air must be admitted freely, and early.

The florist does not waste his precious morning hours in bed, and as the sun shines in on the plants he will observe how rapidly the temperature rises if the ventilators are not open at the top of the house. Unless it be frosty we open the top lights a little at 6 A.M., and again about 8. Shading is necessary as soon as the pips are expanded, for if the sun catches them the rich colour fades, and the flowers may crumple up. Intending exhibitors should thin out from the trusses all imperfect pips, so as to allow of the perfect development of those which remain. Some trusses produce too many flowers, and in that case many of the small centre pips should be removed. Our alpine Auriculas have always been in time for the National exhibition the last Tuesday in April, without removing them from the cold frame; but this year it has been necessary to place them in a heated house. Besides the Auriculas we have now species of other Primula which make the Auricula-house much more attractive. We had excellent example of both alpine and Himalayan species in flower early in March this year, and Primula flowers will be plentiful until the end of May. Those who object to cultivate these alpine treasures in pots, miss the delicate beauty of the flowers early in the year, and in untoward seasons the bloom is usually very poor indeed out-of-doors. Many persons fail to successfully cultivate these Primulas year after year in pots, a fact due in some cases to improper methods of cultivation; but on the other hand many Primulas fail to do well after having flowered a year or two, and it is thus best to raise a few plants annually from seeds; even the common Primrose succeeds best the first year, producing the largest and the finest flowers.

The best way of raising these Primulas and Auriculas from seeds has probably not yet been determined. I have sown the seeds as soon as they have been saved, and this is probably the best way to make sure of their not being injured by damp, but the seeds will keep very well until January, when all of them may be sown together. Nearly the whole of them will vegetate during the months of February and March; in fact, the larger proportion of the seeds sown in summer will remain dormant in the soil until early in spring. I place the seed-pots or pans in the Auricula-house, when germination proceeds but slowly, I have at the present time plants of many species ready to prick out from sowings made in January. The plants must be pricked out as soon as they are large enough, or they run the risk of falling a prey to damp if allowed to remain in the seed pans. J. Douglas.

SOURCES OF THE NITROGEN OF VEGETATION.

FOR many years past the question of the sources of the nitrogen of our crops has been the subject of much experimental enquiry both at Rothamsted and elsewhere. In the *Proceedings of the Royal Society*, vol. xliii., is given a summary by Sir J. B. Lawes, Bart., and Professor J. H. Gilbert, of their own more recently published results bearing on various aspects of the subject, together with reference to the results and conclusions of others which have recently been put forward.

Until the last few years, say our authors, the controversy has chiefly been as to whether plants directly assimilate the free nitrogen of the atmosphere; but recently the discussion has assumed a somewhat different aspect. The question still is, whether the free nitrogen of the air is an important source of the nitrogen of food of vegetation; but whilst few still adhere to the view that chlorophyllous plants directly assimilate free nitrogen, it is nevertheless assumed to be brought under contribution in various ways, coming into combination within the soil, under the influence of electricity, or of micro-organisms, or of other low forms which thus indirectly serve as an important source of the nitrogen of plants of a higher order.

In their earlier papers Messrs. Lawes and Gilbert concluded that, excepting the small amount of combined nitrogen annually coming down in rain, and the minor aqueous deposits from the atmosphere, the source of the nitrogen of our crops was substantially the stores within the soil and subsoil, whether derived from previous vegetable accumulations or from recent supplies by manure; and recent Rothamsted investigations show that in those experiments soils and subsoils down to the depth at which the action of plant-roots has been proved, there exists a store of about 20,000 lb. per acre of already combined nitrogen. And while it is true that many soils will contain much less there are many, especially good garden soils, which contain a much larger amount of inherent fertility.

The history of both agriculture and horticulture throughout the world, so far as it is known, clearly shows that a fertile soil is one which has accumulated within it the residue of ages of previous vegetation, and that it becomes infertile as this residue is exhausted. *John J. Willis, Harpenden.*

CHRISTMAS ROSE CULTURE.

MR. JENKINS gives us another interesting record of actual experiences in Christmas Rose culture, p. 336, and I am glad to find it confirmatory of what I have written on the subject. It is one which is attracting an extraordinary amount of attention. The demand for plants has been very large, and all the nurserymen's stocks are nearly exhausted. We have had many visitors at Brockhurst studying our amateur mode of culture, and one gentleman had purchased 2000 plants, which he was going to cultivate for the flower market, as he found his farm did not pay under present prices of corn and beef. Here, then, is a practical idea worth working at by gentlemen farmers, who may enjoy flower-growing instead of ordinary farming. The demand for flowers is on the increase, and many florists find it far more profitable to sell flowers than plants. Mr. Jenkins asks if my experience agrees with his as to the time at which the roots of *H. niger* are formed. Now, this is a botanical question which well deserves careful study. A root, we are told, "is merely a prolongation downwards of the stem, and the part where they unite is the column or neck." "Afterwards the root is distinguished from the stem by the absence of a provision for the development of leaf-buds." "Such plants as the Anemone japonica have the power of forming buds on what are usually called their roots." (*Encyclopedia Britannica*, article "Botany.") Now, this variety, *H. n. maximus*, has the same power in a remarkable degree. Miss Hope

pointed this out in the *Gardeners' Chronicle* (December 25, 1875) thirteen years ago. She first divided the large plants of *H. n. maximus* into smaller ones, and then cut off as much of the "rootstock" as could with safety be spared, leaving the "true roots" attached to the neck of the plants intact. She then took the rootstock and cut it up into pieces an inch or two in length, "according to the appearance of the buds or swellings," and she found that a very large proportion of these grew into plants, just as the eyes of the Grape Vine produce Vines. I have followed this plan for years successfully. Thus it is evident that Hellebores have two very distinct sorts of roots. The "rootstocks," as Miss Hope calls them, and the "true roots." It was the latter which I termed rootlets (p. 200) in the article to which Mr. Jenkins refers. These may be described also as fibres from the main roots, and I suppose that they serve to collect food for the main fleshy rootstock, and furnish the life of the plant. So far as my observation goes these rootlets are pushed out in March just before the leaves are renewed, and it is at this time that the plant is in its most critical stage of growth, and when removal is not wise. When the plant has just finished blooming, say in February, its next duty would be to mature the seed, if it had any; but as *H. niger* seeds very seldom under culture the plants are then at rest, and it is an excellent time for division and replanting. The plant soon after gets its new rootlets into the new soil, and grows accordingly. Therefore in February I said I should remove two-year-old plants because they were then at rest; and I believe this is also the best time for dividing large plants. Miss Hope advised July for cutting up the rootstocks of *H. n. maximus*, and in this she was right, as it is quite a different matter. My experience, however, is that the root-cuttings do quite well in February also.

Mr. Jenkins also remarked upon my experience with the very large clump of *H. major*, removed here from Devonshire three years ago. Finding it made no progress I had it taken up early in February and divided. I found it to be a large fasciculated mass of roots, all crowded closely together, and those in the centre quite weakly and incapable of bearing good flowers or foliage. The outer rings only were healthy, and they alone seemed to bear good flowers and leaves. The clump would have divided easily into nearly 300 plants, each with its long fleshy root and its crown complete. Every one of these would form a good plant in time, but we left them in small clumps, and these made three dozen good-sized clumps, which were planted out in prepared soil. I had this plant carefully examined in view of the recent discussion about large fifteen-year-old plants, and I am more satisfied than ever that there is a stage in the growth of Hellebores, when it is much better to divide a plant than to continue its growth. The centre of this large example was quite inactive, and a mere circle of small plants would have produced as many blooms. The fourth and fifth years after division I find the plants quite large enough, producing a hundred flowers at one time; and by a judicious system of dividing old plants, and growing them forward, a good succession of large specimens can always be in readiness.

Our outdoor Hellebore plants, sheltered by frames and *clôches*, have been superior to those grown in the cool greenhouse during the past season, but in very wet winters it is otherwise. Both systems should, therefore, be followed, if practicable, as each has its advantages.

No plant deserves frame culture better than *H. n. maximus*. The beauty of its delicate rosy-white flowers is greatly enhanced by this protection, and there are always flowers to be had, from October to February, from a large frame of it. The plants—all our *H. n. maximus*—now in 3 feet borders, so that a frame 12×3×3 feet, can be readily placed over any portion of the beds when required. This is especially needful in snowy weather, and the flowers are continuously produced, irrespective of the cold. This variety differs entirely from all the *H. niger* and *H. n.*

major classes in its root and habit, and it requires a very different treatment. It is, however, the easiest to manage of any, and I think it is the best of all the Hellebores after all for garden purposes, because of its steady continuance in bloom, and its grand foliage. *Wm. Brockbank, Brockhurst, Didsbury.*

THE MELON PEAR.

I INTRODUCED the "Pepino" in 1882 (see p. 753, December 17, 1887) from Guatemala, where it is extensively cultivated in the highlands at an elevation of from 2000 to 5000 feet. The plants there yield abundantly, in fact enormously, 100 to 150 fruit to a vine 4 feet in diameter being nothing uncommon. I have seen it yield similarly in California, but whenever exposed to too much heat and dryness, it is very slow to set fruit. I would recommend you to start the plants in pots; the slips grow as readily as Willow cuttings. Then prepare cold frames with plenty of manure under. Set out as early as possible in spring, and when all danger of frost is over, remove the frame, and if possible, shade slightly. There is no fruit in the tropics or semi-tropics which so readily allays thirst as the Pepino. When properly grown it contains, besides the sugar, an acid of the most refreshing and remarkable kind. A single ripe Pepino will allay thirst for several hours even in the hottest weather. If grown under too much heat this acid is more or less wanting, and the Pepino becomes worthless or insipid, and resembles then simply an inferior Musk Melon.

One winter I picked my Pepinos in November, a day or two before hard frost. They were then unripe, but of full size. They began to ripen at Christmas, and I kept most of them until March; I kept them only in a box in a cold room. This shows the excellent shipping quality of the fruit. I have no doubt that where the Pepino can be set to fruit in abundance, it will prove a most valuable fruit. It is one of the finest I know of, and suits my taste.

Your suggestion that the fruit would be fine as evaporated (dried) strikes me as a new and valuable one. In some parts of Florida the Pepino has produced satisfactory crops—twenty to thirty fruits to the vine at one time. In its native home it bears continually the year round. Could not possibly a hybrid be produced between the Pepino and the Tomato? I have an idea such a fruit would be very desirable. At present I am not in position to experiment, but I suggest that those who are should try. Fertilise the flowers of a Tomato vine with the pollen from a Pepino, and raise seedlings and fruit them. Something very desirable may be had. The small yellow Tomato, so much eaten now, would perhaps be the most desirable variety to experiment upon. *Gustav Eisen, Kern Co., California, in "American Orchard and Garden."*

FRUIT REGISTER.

PEAR ALEXANDRINE DOUILLARD.

A STRIPPEN variety of an old Pear, which appeared, as is ignorantly said, by accident. M. Burvenich remarks that a tree of *Beurré d'Amanlis* in his possession produces every year branches on which the leaves are wholly white. Buds taken from these albino branches do not "take" when budded, while buds taken from the base of the branch grow, but produce shoots with entirely white leaves. *Bulletin d'Agriculture, March.*

APPLE GOLDEN NOBLE.

I was pleased to see this fine Apple was included in the excellent collection shown by Messrs. Veitch & Sons, at the spring meeting of the Royal Horticultural Society on March 27 last. With us it thrives uncommonly well in every aspect, is of very robust constitution, and an abundant bearer. The handsome fruit, when fully matured, leaves nothing to be desired in appearance, and it is, in fact, a noble Apple. As a culinary fruit it has few equals, having just

enough acidity to make it agreeable to the taste without the addition of sugar. I consider it superior, in this respect, to the Wellington or Dumelow's Seedling. During the spring time, well kept examples are an ornament to the dessert, and are formidable rivals to some other favourite late keepers in flavour and appearance. The fruit requires careful handling, by reason of the clear yellow of the skin showing bruises very quickly. The fruit hangs well on trees exposed to high winds, the short, stout footstalk contributing doubtless to this. With some growers Golden Noble is confused with Waltham Abbey Seedling, but they are quite distinct, the former being of erect and robust growth, the latter somewhat pendulous and less strong. We recommend those who have not yet tried the former kind to add it to their collections, being convinced that it will give satisfaction. *J. Hudson.*

PEAR ALEXANDER EARLY.

This is a new and valuable American variety, of medium size, of a fine mottled colour and rich flavour; and while found to be hardy outside, it makes also an excellent forcer. Mr. Thomas King, The Gardens, Devizes Castle, has this season forced it with great success: he began gathering from it on the 26th ult., and by the 30th he had taken eight and a half dozen fruits from the tree; and he speaks of it in the highest terms as suitable for early work. The house was shut up about the middle of November. Mr. G. Bunyard, in his *Fruit Catalogue*, states that it is earlier than the Early Beatrice by ten days. *R. D.*

PEAR BELLE PICARDE.

A Pear of large size, with short stalk, regular pyriform shape, orange-red and speckled on the sunny side; eye deeply set; flesh white, melting, sugary; season December—June. A good dessert Pear, but specially recommended for cooking. *Revue Horticole, April 1.*

NOVELTIES IN DUTCH BULBS.

THESE bulbs have been better than usual, and as the season is unfavourable to the too rapid development of the bloom, these have remained in good condition for longer periods. We attend to the wants of our plants until the leaves begin to decay and the bulbs matured, and then remove them from the soil, to be put aside to plant in pots for early flowering the next season; afterwards to be planted out-of-doors. I find the bulbs of Tulips and Narcissus flower nearly as well the second year as the first. The newer varieties of Hyacinths have been exhibited in very good condition this year. In novelty of colour and size of spike they are much liked, and are surely if slowly displacing the old varieties. King of the Blacks, for instance, as exhibited this year, has been remarkably fine; the colour is rich blue-black. Masterpiece, a very dark blue, has also been fine. The pale blue Princess Mary of Cambridge is a lovely colour, which does not fade like *Czar Peter*. A well-known pale yellow variety, Queen of the Blues is a distinct pale blue variety, likely to become famous, but I have not yet seen the spikes large enough for exhibition. Amongst crimson varieties nothing can surpass *Vuurbaak* when it comes out as it has done this year; I grew six bulbs of it, and every one of them produced spikes fit for exhibition. Linnæus has also been very fine; there is a rosy tinge in the crimson of this variety. Of the pale red or rose-coloured varieties there is nothing yet, equal to the semi-double *Koh-i-noor*; it can always be depended upon to produce massive spikes. Messrs. Veitch, of Chelsea, exhibited quite a new variety of this colour named *rubra maxima*; the spikes were long, and massive at the base, but rather too thin at the top; they may grow out of this another season. *Etna* is distinct, and has been very fine this year; the bells rosy-red in colour, well formed, and producing a solid massive spike.

White varieties are still headed by *La Grandesse*,

the form of whose bells and the massiveness of the spike are remarkable; *L'Innocence* has been good, and the old variety *Mont Blanc* still retains a second place. The best yellow *Hyacinth* I have seen as yet is *Criterion*, a new variety exhibited by Messrs. Veitch, of Chelsea; and quite desirable is *King of the Yellows*. *Sybil* is certainly one of the best of the lilac-purple varieties; it is less bright than *Sir Henry Havelock*, but the spike is larger and very massive.

Star of Hillegom is the best of new blush coloured varieties shown this year. It is a semi-double with well formed, large spikes. Amongst Tulips we do not seem to improve upon the few old standard varieties, *Ophir d'Or* is the most recent, and is the best yellow extant, the flowers being large and well formed. The best white variety is the rather new white *Joost van Vondel*; *Proserpine* remains the best formed rose-coloured early Tulip; *Keizer's Kroon*, *Wouwerman*, and *Joost van Vondel* are the best of the rosy-crimson varieties.

A few desirable *Polyanthus Narcissus* have come to the front during the past few years. *Narcissus*, yellow with orange cap, flowers very freely, but the colour is not so rich as that of *Jaune Supreme*. *Mont Cenis*, a variety I have grown for two seasons, has flowers which are white with a yellow cap, freely produced, but these are smaller than those of *Bazelma major*. The plant has a more compact habit; and the trusses are supported on stouter stems. *J. Douglas*.

APPLE CULTURE.

It is a somewhat odd circumstance, that whilst not only is a special society or committee formed for the purpose of favouring the growth in this country of an article of such questionable value as Tobacco—Parliament itself being even moved to aid and encourage its culture—that little or nothing should be done of a specially practical nature to promote Apple culture materially. Possibly the secret of this activity on the part of Tobacco growers is found in the trade pressure which has been exercised in its behalf, and which doubtless hopes to find in British Tobacco culture eventually some tangible reward for its enterprise. But no one will for a moment hold that for general usefulness or national value Tobacco can for one moment compare with Apples; for the latter, far beyond being a luxury, is indeed food, and, it might be added, essential food for a nation in a temperate climate such as that of England. Possibly an exotic plant such as Tobacco is needs very much nursing and care, hence the formation of a body specially to protect its interest. Apples are of rougher mould, and can fairly well take care of themselves. Still farther, they are happily exempt from the thrall of the revenue officer, although were they not so we should doubtless find far more of Governmental concern for Apples' welfare. Not that Government aid is needed in respect of Apple culture specially, but it is certain that some valuable Parliamentary help might be given in the direction of placing the holding of land upon a more simple and equitable basis. At present, if landowners refrain from planting trees or refuse to do so at their own expense, tenants, whether farmers or market gardeners, have little inducement to do so, except where land is held on long leases. But it is seldom that these exceed twenty-one years, and few are the tenants, farmers especially, who will plant Apple trees with the assured certainty that at least one half of their term of holding the land must expire ere the trees will prove profitably productive. That is specially the case with orchard standard trees, and peculiarly so in respect of some of the strongest growing but most enduring varieties. Generally the market grower, and especially those who cater for the London markets, favour the growth of Apples which, fruiting fairly early in the season, may be gathered and marketed ere the winter sets in. It is thus seen that as far as the market trade is concerned very little is done towards competing

with the American or Canadian Apple grower, whose fruit comes to hand later in the year, and it is also evident that the imported American fruits but inappreciably affect the average market grower's profits. We have to get farther afield to find the needful area for competitive Apple culture, and that will be best found on the sunny slopes and sheltered valleys of our southern and western counties, where, without doubt, aided and protected by liberal land laws, Apple culture in an extensive way may well become a matter of national importance and of exceeding interest and profit.

Without doubt we should find an immense impetus given to Apple culture in the rural districts, where small farms and holdings were plentiful—assuming, of course, that such farms and holdings were either directly the actual cultivators, or else that occupiers had very long leases, or held under such conditions as would ensure to them the full value of their trees in the event of being dispossessed. It may be urged that landowners having suitable sites for extensive Apple orchards might well undertake the first cost of planting trees, which would, after all, be, to wealthy men, no great burthen; but then that could only be urged where landowners really were wealthy, whereas but too many are now poor, and still farther, so many of them are mere life tenants of their land, and have but small interest in planting and improving for the benefit, perhaps, of successors. Of course, the case of working and beneficial occupiers of land differs very materially from that of the ostensible owner, who is not the real occupier, for the former has every reason to make the most of his holding, consistent with safety, for his future interests; but when the working occupier of land is his own landlord also, then the motives to make the most of the land are doubled, because the product of labour is in that case to the present worker's entire profit. If, in conjunction with that production for the benefit of the living worker, the land is increasing in productive value for the benefit of his successors also, so much the better; hence it is very evident that the inducement to plant Apple trees on own holdings would be far greater than all those which now exist. It is very obvious also that the mere planting of Apple trees in quantity, and even of the most desirable kinds, is far from being enough. Land, let it naturally be ever so good, must none the less be prepared by deep cultivation, and, if need be, drainage, although it would hardly be good policy to plant extensive Apple orchards on land which needed costly draining. However, more or less expenditure of this kind would have to be met if an Apple orchard was to develop into a good though perhaps deferred investment. In all cases the trees would need staking and some occasional pruning, and it would be good policy to utilise the soil around the trees by growing for several years Potatoes, Maogels, or other crops which required no machinery to harvest. The trees getting by that time strong and well established, would be able to hold their own should the land be laid down to grass, for, after all, whether culturally the best plan or not, popular favour is most generally shown for orchards on grass. That so many of what were promising orchards on grass have done so badly later is due, first to the fact that the ground was not in the first place deeply moved and drained; second, that the grass has received but little manurial aid, indeed has been robbing the roots of the trees of their food; and lastly, the trees have, as a rule, been grossly neglected in the matter of thinning and cleaning. That there are plenty of fine orchards on grass in the western counties is certain, but those, it is found, are chiefly occupied with trees which are required to produce decent cider fruit, and not such fine fruits as will compete with the American imports. We are not so ignorant of the requirements of Apple culture in this country as to need the aid of a commission of inquiry into the methods of culture, &c., found so abundantly in North America. Given a free hand, without doubt our growers and occupiers of land at home could hold their own with the rest of the world. It may

be that some sound advice as to the best sorts of Apples, to grow for mid-winter marketing, and such as would be able to compete with American Apples, is needful; but the selection should be a liberal one, because sorts vary much in diverse soils and districts. We seem to be unanimous as to the great merit of the *Blenheim Pippin* for such purpose, and although a dozen others as good may not be found, at least not a few nearly so are available; we can furnish an immense area, ranging from Worcester in the west, to Cornwall in the south, and Kent in the east, which could furnish thousands of acres of suitable land for Apple production; and we may be assured also that our nursery trade would soon respond to the demand for suitable kinds if once created. Just now, perhaps, nurseries teem with too many kinds, two-thirds of which are worthless for the special purpose in view; but any great national effort in Apple planting will not be made immediately, and ere it is made it is hoped that nurserymen will have fully prepared for the demand. *A. D.*

COLONIAL NOTES.

FREESIAS AT THE CAPE.

PRACTICAL men at the Cape have read Mr. J. G. Hill's communication, p. 107, January 28, upon the *Freesia* with much surprise. It is scarcely possible that he is by mistake writing about a different plant from the white-flowered species, known rightly or wrongly among gardeners as *F. odorata alba*, and cultivated here in thousands for export; yet his description of it as 3 feet high makes one suspect an error. There are two garden forms of the white-flowered *Freesia*, and two of the yellow one, but none of them are in the smallest sense semi-aquatic, nor are they to be found near streams. Their natural habitat is dry stony ground, where the almost perpendicular formation of the rock leaves numerous cracks and crevices level with the surface. In these the *Freesias* grow and prosper, although their bulbs are often compelled to flatten out like a penny piece. I believe the original locality whence the white *Freesia* was obtained by Ecklon and Zeyher was not far from Bredasdorp, at a farm called Zoetendaal's Vrey, and onward towards Cape Agulhas. The yellow *Freesias* are quite Eastern; they come to us from the neighbourhood of Uitenhage. As to the culture, I find it an impossibility to keep them growing all the year, as *Vallottas* and *Imantophyllums* may do, and if they get water in our dry summer—that is, from December to March—the greater part of the large bulbs rot. It is just this peculiarity of our Western Cape bulbous plants, and of *Freesia odorata alba* among them, that renders their culture so difficult in the Eastern Province and Natal. There the seasons are the converse to ours, and they have a rainless winter and a wet summer. Hence your correspondent must either be writing of some other plant than this *Freesia*, or else he has been misinformed, for it is not a native of Natal, and when grown there is even more difficult to manage than in England.

There would probably be fewer failures if this plant were treated as is usual with Dutch bulbs. My plan would be to put from six to nine bulbs about 1 inch deep in well drained sandy loam in 6-inch pots; set them on a hard bottom, and after a good watering cover over with cocoa-nut fibre or other light material. Before long the pots will be full of roots. When the plants begin to show up above the soil remove them to a warm greenhouse, and keep them well supplied with water.

I find here that bulbs which are left in the ground all the year flower much better than those that have been lifted. Those planted early in March make more foliage and bloom better than those that are planted in April, and so on, till such as are left above-ground very long will not start at all that season. This is probably the explanation of complaints made respecting imported *Freesias* not

coming up. They have been kept dormant too long, and their season for starting has gone by. I much prefer the medium-sized bulbs to the very large ones, which are apt to spawn. A bed of these lovely bulbs, with 9000 or 10,000 of them in flower at once, is a sight worth coming to the Cape to see, and you may find their whereabouts by their perfume long before you see them. *H. Chalwin.*

— My colleague and head gardener, Henry Chalwin, in the above note gives his experience about Freesias, and I have added the locality whence Ecklon and Zeyher are believed to have got the white Freesia, and where it is said to have been originally found by Upjohn.

Many of Ecklon and Zeyher's exsiccata are marked "A. D. B. G.," that is, *aus dem botanischen garten*—meaning the plot of garden ground where Advocate Joubert permitted Ecklon to cultivate his bulb stock. As the *Topographisches Verzeichniss* is dated 1827, there is reason to conclude that this Freesia has been under culture for at least sixty years, and by perpetual selection of the whitest flowers the present garden form has been fixed. Now and then in our gardens plants appear exactly resembling Redouté's fig. 124, *Gladiolus xanthopilus*, with short scape, abundant foliage, and perianth yellow-stained within, purplish without. As a rule, these are rogued out. I do not remember to have seen a truly wild example of the white-flowered plant. There are only garden examples in the Cape Government herbarium. My conclusion is that *F. odorata alba*, so-called, is *F. xanthospila*, Klatt., and that the type-form is fig. 124 of Redouté's *Liliaceæ*. Of the other species *F. Leichtlinii* is unknown to me, even by figure. *F. odorata* of Ecklon is his No. 286, a dwarfish, short-leaved bright yellow-flowered plant from Uitenhage. On first starting, the leaves turn over sideways flat to the ground, and do not take the erect position till the scape appears. *F. refracta*, Klatt., is, by the author's quotation, Redouté's fig. 419, —a taller species, with dull greenish-yellow perianth. We scarcely deem it worth cultivation. Hence the garden view that there are two yellow Freesias and two white or whitish ones. Can the synonyms be put in order, or must all four forms be lumped under *F. odorata*? If so, Ecklon's name must be dropped as the authority, and the responsibility assumed by some one else. *P. MacOwan, Botanic Garden, Cape Town.*

SOLANUM CORNIGERUM.

Since my last I have taken especial pains to verify what I then suspected, viz., that *Solanum cornigerum* was merely a variety of *Solanum mammosum*. I have found plants producing both varieties of fruit, some with none, some with one, two, three, four, and five protuberances on the fruit. The plant is very common here, and each variety can be gathered at will from the same plant. Seed has been sent to the Royal Gardens, Kew, and other places, which will, when grown, doubtless prove the point, viz., that *S. cornigerum* is merely a variety of *Solanum mammosum* as aforesaid. *J. H. Hart, F.L.S., Royal Botanic Gardens, Trinidad.*

ENTOMOLOGY.

THE FLY OF THE IRIS LEAF.

THE injury committed by insects upon plants is not confined, as might at first be supposed, to the destruction of the leaves, flowers, or even the stems, by those parts of the plants being entirely devoured by the depredators. Partial injury is often as detrimental as total destruction, and it may be carried on without the enemy being detected or even its presence being suspected. This is especially the case where, from their minute size, the insects are enabled to subsist within and devour the interior of stems or of leaves whilst both the upper and under surfaces of the latter exhibit no appearance of the mischief going on within the leaf. The caterpillars of the larger and better known moths or other insects, for instance, devour the entire leaves

of plants sometimes as in the case of the ermine moth, lacquey moth, Currant saw-fly, &c., entirely defoliating the plants on which they are found; but there are many smaller species of moths and other tribes of insects which find sufficient subsistence in the parenchyma of the leaves, their presence being only detected by the sharp eyes of the horticulturist who perceives an unusual difference in the surface of the leaves, in the shape of withered patches, which might be supposed to originate in sun-burn or spots of rain at unusual times. Such was the case with some plants of *Iris ochroleuca* forwarded to us last August by a correspondent who had noticed such patches on the leaves as partially represented in our woodcut (fig. 69) where the patch is seen of a lighter tint both above and below the portion of the upper surface of the leaf, which has been raised in order to show the interior of the wounded part of the leaf, with a row of little oval black shining bodies arranged side by side, one of which is represented magnified in the upper part of

end, the head small and very retractile, armed in front with two or three points, one of which extends backwards internally, and constitutes the instrument which the insect employs for raking up the fine particles of the fleshy interior of the leaf for its food. There are no legs, and the extremity of the body has two very small retractile appendages, which are thickened at the tips.

The injured portion of the leaf also contained several specimens of the perfect insect produced within the pupa-cases, but these were unfortunately in an imperfect condition, so that I am unable to give so satisfactory a description of them as I could desire. It is, therefore, on this account that I can only provisionally suggest the generic name of *Agromyza* for this insect (a species of which genus was figured by Mr. Curtis as the Pansy fly, *A. violæ*, in the *Gardeners' Chronicle*, 1844, p. 244), and the specific name of *A. Iridis*. They measure about one-eighth of an inch in length and one-quarter of an inch in the expansion of the wings. They are of a black colour, and the upper side of the abdomen is flat. The wings hyaline, with fine black veins, which are of a yellowish tinge towards the base of the wings. (In our figure of the fly the two short cross veins in the middle of the wings are represented too far apart, and they are nearer the base of the wings than the middle of the disc.) The legs are black, and the balteres have the terminal knob white.

Notwithstanding the apparently secure position within the leaf, the larvæ of the fly are attacked by a beautiful little Pteromalideous parasite, of a golden-green colour with yellow legs, one of which I detected escaping from the pupa-case of the diptera. *I. O. W.*

CULTURAL MEMORANDA.

MAURANDYA BARCLAYANA AND ITS VARIETIES.

THESE are half-hardy purple and white flowering climbers of small growth, well adapted for greenhouse cultivation as basket or rafter plants, and will succeed out-of-doors in warm situations, and are then serviceable for planting at the margin of vases, on rockwork, or to twine round the stems of standard Roses and similar supports. Seeds sown now in light sandy mould, covered lightly, and after watering put into a warm frame and watered through a fine rose, will soon come up. The young plants should be pricked out into pans at 2 inches apart, or put into small pots, watered, and put back in heat, subsequently taking the plants up with little balls of soil, and transferring them to their flowering positions, making the soil firm about the roots in planting. Those plants intended for planting out-of-doors should be duly hardened off before being planted. In the greenhouse the plant is a perennial, and may be planted in the border, and allowed space to grow freely.

MANDEVILLA SUAVEOLENS.

A free-growing greenhouse climber, with fragrant pure white flowers. It is propagated from cuttings and seed. Those not having cuttings at hand, and who wish to grow the plant, should obtain a packet of seed, and sow it at once in light mould, in heat. The young plants should be pricked out like *Maurandya*, in a compost of fine sandy loam and leaf-mould, watered, and put back into heat, and near to the glass to avoid weakly growth. In due time pot them off into 3-inch pots, shading the plants from the sun until the roots have taken to the soil, keeping them moist at the roots, and in a growing atmosphere in a close frame.

EUPATORIUM RIPARIUM.

AS a winter-flowering plant this is now well known and appreciated, especially as it may be cultivated in any greenhouse from which frost is kept out. Small plants in 3-inch pots, allowed to grow without being stopped, are excellent for furnishing when 12 to 15 inches high and 6 to 9 inches through at the base. These in the course of two or

FIG. 69.—THE IRIS FLY.

the woodcut, and is seen to be impressed transversely, forming not very well defined segments, and which is the indurated skin of the larva or coarctate pupa, as it has been erroneously termed, of a small two-winged fly, the real pupa of which is inclosed within the oval shining black body. This is the ordinary condition of the pupæ of the very numerous species of dipterous insects forming the great genus, *Musca*, of Linnæus, or rather the modern family of *Muscidæ*, of which several instances are figured in our entomological series of articles, as in the Holly leaf-miner, *Gardeners' Chronicle*, 1846, p. 444; or the Marguerite leaf-miner, *Gardeners' Chronicle*, 1853, p. 593; but in no instance have we met with these pupa-cases arranged in the peculiar manner shown in the species now under notice. Our correspondent informs us that this insect appears to affect the whole of the species of the section of the genus *Iris*, to which *I. ochroleuca* belongs, but that the sections of *I. siberica* and *germanica* are free from its attacks.

Within the affected portion of the leaf a few larvæ of the fly were also found, one of which is represented magnified on the right side of our woodcut; it is long and fleshy, and narrowed at each

three years may be grown to large dimensions—5 feet in diameter if necessary. Increase is by cuttings of the young growths or by seed sown at once, the young plants flowering next winter.

The seed should be sown in fine soil, on a slight hotbed, and the seedling plants pricked out into a pan, and returned to the hotbed, afterwards potting them off before they touch each other, and growing them in frames, shifting as may be necessary during June and July. *H. W. Ward.*

BALSAMS.

Sow the seeds singly in thumb-pots filled with light soil, water lightly, and place in warmth. When they are up keep the young plants always near the glass and moist at the roots. Shift them into 3-inch, 6-inch, 7½-inch, and 8½-inch pots respectively before the roots become matted, keeping a small percentage of the plants in 6-inch pots for furnishing purposes, and pick all the flowers off the plants as they appear until a fortnight before the time at which it may be desired to have them in flower. A good compost to grow them in, consists of four parts fibry loam and one of horse-droppings and leaf-mould. The plants require air in abundance through all their stages of growth, to prevent them making weakly growth; and overhead syringing on bright afternoons promotes growth, and wards off the attacks of red-spider. After the plants have pushed their roots well into the soil of their last shift, alternate waterings of diluted liquid manure at the roots will prove beneficial.

TUBEROUS BEGONIAS IN POTS.

No time should be lost in putting these into heat, and a forcing-house will suit their present requirements admirably. Prick over the surface of the soil before giving sufficient water at the roots to moisten the soil. As soon as the tubers start into growth shake the old soil off the roots and repot in a mixture of four parts fibry loam and one of horse-droppings and leaf-soil, with a dash of coarse sand added, returning the plants to a position near the glass, and giving water to settle the soil about the roots. A week or two later, after the roots have got to work, stand the pots on coal-ashes in a frame or pit having a southern aspect, where they may have plenty of air admitted in favourable weather, so that the growth may be sturdy. To increase the plants, cuttings of the young growths about 2 inches long should be taken, and put into pots filled with sandy soil, and plunged in a hotbed, watered and kept close till rooted, when they may be potted off singly into 60's and returned to heat, and, after the roots have pushed into the soil, be stopped, and afterwards treated as indicated above.

MANETTIA BICOLOR.

This graceful twining plant is rarely met with in prime condition, and this is the more remarkable as the plant is a wonderfully free grower. Its habit is nearly as slender and graceful as the well known *Myrsiphyllum asparagoides*, and add to this its brilliant flowers, produced from the axils of the leaves, and about the size of a single *Bouvardia* flower, and we have a very pretty flowering plant. The leaves are of a pleasing light green colour, opposite, narrowly elliptical, and tapering to each end, with the apex pointed. It has a free branching habit, and the flowering sprays look exceedingly well either on the plant, or when cut and mixed with other flowers, its pendulous habit making it very useful for placing in vases and epergnes. The plants can be kept for years, but the most satisfactory way of growing the plant is to raise a fresh specimen annually. Cuttings put in at the present time and treated in the usual way will by autumn have made nice flowering plants. If large masses are desired put several cuttings in a pot, and give liberal treatment afterwards. A light open compost and stove temperature suits it best. It begins to flower about Christmas, and lasts about six months. There are several other species of *Manettias* worth growing, indeed some are larger flowered than the species under notice, but bicolor I consider is the most attractive

of the group. *M. micans* has shining wide-mouthed flowers, and makes a good pillar plant, which by syringing well during the growing season may be kept free from insect pests, scale being perhaps the most troublesome if it gets a footing; should it do so, a little "Swift and Sure" insecticide, applied according to the directions on the bottles, will speedily remove it.

GOODIA LATIFOLIA.

A beautiful Australian Pea-flowered plant, not often seen outside public gardens, yet it is a good ornamental plant for the greenhouse or conservatory. It is of a free branching habit, producing large panicles of yellow flowers from the points of the branches—both main and lateral branches flowering freely. The standard or outside petal is, as usual, the largest; it is yellow with a brownish-red splash of colour at the base; the wings are erect, closely applied together, and enclosing the keel, which is small. The flowers have an agreeable scent, and last for a considerable time in perfection. Propagation is by cuttings, but seeds are the best means of increasing the plant, which, if sown now and grown well, will flower about this time next year. After the plants have done flowering they should be cut hard back, syringed, and otherwise encouraged to break; after which they may be slightly shaken out and repotted in good fibrous loam and leaf-mould, and towards the end of summer they are benefited by being stood out-of-doors, housing them before there is danger from frost. *F. R.*

CINERARIAS.

A pinch of seed should be sown now, and again in about a fortnight. The seed must be sowed thinly and evenly in well drained pans of light sandy loam and leaf-mould; make firm and water before sowing the seed. Cover lightly with very fine soil, put in heat, and place a square of glass over the pan, and over it a little moss, which must be removed as soon as the seedlings appear, and the glass a few days later, and the pan be placed near to the glass to prevent the weakly growth in the plants. *H. W. W.*

THE SUPPLEMENTARY SHEET.

THE BAOBAB TREE.—This giant of the vegetable kingdom, which Humboldt speaks of as "the oldest organic monument of our planet," belongs to the natural family, Bombacæ. The Baobab was considered the largest tree in the world, but is now known to be exceeded, in length of trunk at least, by the *Sequoia gigantea* of California. The usual height is from 50—70 feet, and not at all in proportion to the dimensions of its trunk, which occasionally reaches a diameter of 30 feet.

The flowers are white, solitary and pendent on long stalks, and when open are quite 6 inches across. The fruit is an oblong woody capsule covered with short down, and measures nearly a foot in length: internally it is divided into eight or ten cells, each cell filled with pulp, in which the seeds are imbedded.

A. digitata, the species figured in our Supplement, goes under various names in the different parts of the African continent, of which it is a native, and is known to English travellers as the *Æthiopian Sour Gourd*—*Monkey-bread*.

It is found in Abyssinia, Senegal, and on the west coast as far south as Angola, and on parts of the east coast. The particular specimen figured grew at Quillimane, on that coast. This tree is 120 feet in height, and is of the supposed age of 5000 years. The data as regards age is taken from Adamson's computation of the age of a tree he saw in Senegal in 1794, which was 30 feet in diameter, and whose age he stated to be 5150 years. From the bark a coarse fibre is obtained, which the natives manufacture into ropes, &c., and the leaves are used as a sauce with their food, not as a condiment but to diminish the excessive perspiration. The pulp of the fruit is given in malarial fever.

The photograph from which our figure was taken

was kindly furnished by our valued correspondent, Mr. W. Adlam, of Pietermaritzburg, Natal.

CELOSIA PYRAMIDALIS VAR.

The plant from which our illustration is taken was shown in a group at the November exhibition of the Birmingham Chrysanthemum Society, by Messrs. Thompson. It is a well developed plant, of rich crimson colour, called *plumosa*. The cultural details, which are very simple, are as follows:—

The seed was sown on March 15, in heat, and the young plants were potted into 60-pots and grown on in a Cucumber frame until 8 or 9 inches high, and were then re-potted and grown on in an intermediate-house with a temperature of from 50° to 60°, and ultimately removed to a cool house. The plants averaged 4 feet in height from the pots, and 2 feet 6 inches through. The soil used is two part loam, one part well decayed horse-dung, and one part leaf-soil, with a sprinkling of guano in the compost. The plants are not stopped at any stage. With this easy cultivation the *Celosia* should form an important object amongst our winter decorative plants, and smaller plants in smaller pots would find a ready sale, but it is seldom that we see it done well.

THE ORCHID HOUSES.

WINTER being now past, the time has come for arranging the Orchid-houses for the summer season. Long practice in Orchid growing teaches gardeners who study the requirements of their plants that certain plants do best when placed in certain positions. This may often be done for convenience rather than for any other motive, and the surrounding conditions are often such that plants thrive in an extraordinary manner, thereby teaching a useful lesson to the observant gardener. Many hints can be gathered by visiting various collections of Orchids, especially when those in charge of them are ready, as they mostly are, to explain their methods of cultivation, and thus, by exchanging notes, much time is saved in arriving at proper methods which suit certain species of Orchids. Anyone commencing to grow Orchids soon discovers that there are other points of culture to be studied besides that of temperature. Many species enjoy the heat of the warmest house in the summer, but it requires some forethought to place the shade-loving species and those that enjoy plenty of light in their proper position during the summer months. Those who have the choice of only three separate houses in which to grow their plants may succeed very well by shading one part of the house heavily or fixing a permanent shading over a part, and by this means making less use of the roller-blind, and giving the other occupants of the house as much sunlight as they require. Most of the *Dendrobiums*, when growing, delight in the heat and moisture of the East Indian-house, provided they can be lightly shaded. I have previously given a list of those species which I have found to grow best in strong heat; to these might be added a great many more.

Every assistance should be given to Orchids starting to grow by keeping a moist atmosphere while there is plenty of sun-heat, and no more ventilation being given to the warmest houses than is necessary to keep the air sweet. In order to prevent the moisture from escaping too rapidly from the East Indian, cool, *Odontoglossum*, and *Masdevallia* houses, ventilation should be given at the top only, during bright sunny days. The cool-houses need fire-heat no longer, and should be shaded sufficiently heavy to keep down the temperature as soon as the outside temperature rises to more than 40°.

Cold winds are found to be very trying to the various species of *Phalanopsis*, which may, however, be assisted by placing a little fresh green sphagnum about the roots; and such as require it may now have new baskets or cylinders. *Lycastes* and *Anguloas* should be examined as soon as growth recommences. For a potting compost use lumps of fibry peat and light loam, some sphagnum and broken Oak leaves. After potting water sparingly for some time, only damping the surface with a fine rose syringe.

There will be found much to do in the *Cattleya*-house, and the plants of *Cattleya Trianae* and *Calogyne cristata* should be set right for the summer. A growing temperature should be maintained after this date. The temperatures may range as follows:—Cool

Odontoglossum and *Mislevallia*-houses, 50°—60° F.: intermediate-house, 60°—70°; East Indian, 65°—75°. On bright days check the fires, and afford a little ventilation by the upper sashes early in the day, but let the temperature of the East Indian-house rise 10° or 15° before ventilating it. *Cattleyas* and *Lælias* are best kept in health when the air of the house is caused to circulate by means of top and bottom ventilation. *C. Woolford, Downside, Lztherhead.*

PLANTS AND THEIR CULTURE.

PALMS AND CROTONS.—With attention to one or two details the culture of these plants is simple, both genera with few exceptions delighting in a high temperature, with abundance of moisture both at the roots and in the atmosphere—and, unless when in a young state, full exposure to the sun. Both require rich soil of a loamy character, and Palms that of a heavy holding nature, to which their roots can lay a firm hold. There are a few points which should be observed in potting Palms, viz., to afford good drainage, and never, if it can be avoided, to cut off any of the roots, especially if the plants be small or weak, as their chances of recovery from the injury will then be extremely small. If the plant is sickly, and has not got the best of soil to grow in, it will be better, provided the drainage is made good, to leave it alone until it shows signs of renewal of growth; and in repotting be careful not to bury up the stem of the plant, but let its base be level with the surface of the soil; inattention to this particular would most likely prove fatal, even in the case of large plants. Unhealthy Palms, when the drainage and soil are good, are best assisted by applying a top-dressing of some mild manure, which will do much more for them than if they were shaken out and repotted. The present is a good time to give the collection a general overhauling, the conditions being now favourable for the growth of the more tropical species. Some useful species do very well in an ordinary greenhouse, provided sufficient moisture is afforded them and they are occasionally well syringed. In a fernery or greenhouse where frost is excluded, the following species may be grown:—*Areca Baureri* and *A. sapida*, *Kentia australis* and the genus *Rhapis*, also *Scaforthia elegans*, *Jubæa spectabilis*; and, as is well known, *Chamærops Fortunei* and *excelsa*, which are hardy in this country. It is, therefore, evident that some species of Palms may be successfully cultivated by anyone who has a garden; but without plenty of heat at command it would be but misdirected energy to attempt the cultivation of the tropical species, *Stevensonia*, *Maximiliana*, *Calamus*, *Desmonicas*, or *Cocos*. Palms, with few exceptions, are propagated by seeds, which if plunged in a moist bottom-heat will soon germinate, when they should be potted off singly before the roots get entangled. The seeds of popular sorts, as *Cocos Weddelliana*, *Kentia*, and *Livistona*, *Latania borbonica* come frequently to the London sale rooms, and can be purchased at a few shillings per thousand seeds.

Crotons require a treatment similar to that afforded the tropical Palms, but less care need be exercised with the roots in re-potting, but avoiding over-potting, and making the soil in the pots quite firm about the roots. *Crotons* are propagated either by seeds or cuttings. For cuttings select large pieces and treat them as advised for cuttings at p. 110, January 28. There are now many forms of these plants, but few surpass the old *C. angustifolius*, when it is well grown, especially as an object for the table. These plants are much benefited by copious and forcible syringing, at least once a day, well damping the house afterwards. As regards the ventilation it is better to keep the front or bottom ventilators shut, leaving open a chink at the top to let out superfluous heat, and to change the air gradually.

Cool Bulbous Plants.—*Ixias*, *Sparaxis*, *Babianas*, *Gladiolus Colvillii*, *Scilla peruviana*, the evergreen *Libertias*, and similar things, are now pushing up their flowering-pikes, and should have increased attention as to watering, cleaning the surface of the pots, and ventilation. If the stock of bulbs is large, a portion may be brought in the greenhouse to flower earlier than the bulk, but it should be remembered that the plants dislike fire-heat. A place in a light, cool frame, with free circulation of air on favourable occasions, and not over much water are the proper conditions for these plants.

Greenhouse Bulbous Plants will require similar attention. *Lachenalias* which are coming into flower should be kept close up to the glass, taking care not to place them in a draught. These are handsome little plants, and are very effective when arranged with other plants. *L. aurea*, *L. Nelsoni*, *L. tricolor*, and *L. pendula* are the species usually met with in gardens, and are probably the best of the genus. The Australian *Patersonias* may be potted if they require it, using chiefly peat and sand only. These plants like plenty of water when growing, and must not be dried off like deciduous bulbs. *Hamanthuses*—quaint looking plants in flower and foliage, but withal interesting and showy. The brushlike scarlet or white inflorescence usually springing from the naked bulbs is followed by huge thick leaves, generally in pairs. In *H. Kalbreyeri*, *H. puniceus*, and others the leaves are more inclined to be petiole or sheathing, oblong and bluntly pointed, and in *H. sanguineus*, *tigrinus*, and others the leaves are very large and ornamental. These plants do not require much water at any season, and it should be entirely withheld as the leaves ripen off.

Herbaceous Calceolarias.—Keep a sharp look out for greenfly, and do not permit it to obtain the least footing, or the beauty of the plants when in flower will be short-lived. It is safer to fumigate them occasionally, even if no fly be then visible. A little tobacco-powder dusted on the under-side of the leaves is a good preventive. Neatly stake the flower stalks as they push up, and shade the plants from bright sunshine; in watering give frequently weak doses of soot-water, which has become clear after mixing, or, where it can be had, use diluted liquid farmyard manure, and guard against letting the plants get dry. *F. Ross, Pendell Court.*

THE FLOWER GARDEN.

TREES AND SHRUBS.—Examine those which were recently transplanted, and water the same if necessary. Evergreens in light or sandy soils will be greatly benefited by copious watering at the present time, the ground, owing to the meagre rainfall, being abnormally dry, and not favourable to root-growth. Any plants which show signs of shrivelling of the bark of last year's growth should have temporary shelter from the drying east winds which we may experience any time during the next few weeks. Most of the planting operations for the current season, excepting that of *Hollies* and *Conifers*, should now be completed, and wherever it is admissible mulch newly planted stuff.

Seeds.—The present is an opportune time for sowing seeds of numbers of hardy perennials, which, although succeeding out-of-doors if properly treated, I prefer to sow in pots of moderate size and place in cold frames. The pots should be clean and well drained, and filled two-thirds full with potsherds and a layer of moss over these, and making up with suitable compost. The following plants may be raised from seed, viz.:—*Agrostemma Flos Jovis*, *Anthericum liliago*, *A. lilastrum*, *Aquilegia*, *Campanula carpatia*, *C. turbinata*, *Chelone Torreyi* and *C. barbata*, *Cheiranthus alpinus*, *Dietamnus fraxinella*, *Dodecatheon splendidum*, *Genium coccineum*, *Lynchnis Haageana*, *Oenothera macrocarpa*, *Poppies*, *Himalayan Primulas*, *Rudbeckia Newmanni*, *Silene acaulis*, *Silene alpestris*, *Phlox* and *Delphiniums*. Many more might be named, but these will be found suitable for a beginning. *J. Horsfield, Heytesbury.*

FRUITS UNDER GLASS.

PLUMS.—Where the fruit is set too thickly, thin them out so that the crop is evenly distributed over the trees, always leaving those which are the best placed. Pinch lateral shoots so as to produce fruit spurs about the third or fourth leaf, and remove the point from strong shoots, but allowing the leading shoots to grow where there is further need for extension. Plums are subject to be infested with the same insect as Cherries, and the same means hold good for their extermination. *See Calendar, April 14.*

Pears.—Whenever it is noticeable which fruits appear most likely to take the lead, all others should be removed forthwith, and by-and-by the number of those left may be reduced to one on a spur, if there be an even distribution of them over

the trees. Pinch in the lateral growths in time, and frequently examine the foliage at night for weevils; syringe the trees twice a day, and give good attention to watering them.

Strauberies.—To secure fruit of the finest flavour the plants must receive abundance of air, and a cool atmosphere for a few days after they are coloured, else they will not be worth eating. Continue to bring forward successions as the earlier plants are cleared out, and continue the copious syringings and the daily application of weak manure-water; give attention to the early thinning of the fruits, and hand fertilisation may now be discontinued, the more thorough ventilation and bees, &c., rendering that act unnecessary.

Melons.—The earliest fruits will now require to be supported when growing on trellises, and for this purpose some growers use pieces of board of 6 inches square suspended by a string or wire at each corner, others three or four strands of soft matting crossed. I have tried both these methods, and find that when touched by any object there is a liability of the arrangement being upset, the sudden jerk often detaching the fruit from the stalk. I have a preference for a 9-inch square of netting suspended by the four corners, which is secure against such accidents. The night temperature may range from 70° to 75°, admitting a little air whenever the weather is fine. Attend to top-dressing and to stopping the shoots of successions after the requisite number of fruits have been set, and keep up the supply by timely sowings. For succession pits a temperature of 65° to 70° will be sufficient at night. Avoid the too liberal application of water, this being conducive to weak foliage, and which is readily injured by the sun's rays.

Cucumbers.—Do not overcrop the plants, or exhaustion will follow, and some considerable time will elapse ere they can be brought to bear satisfactorily again. Pinch the shoots of vigorous plants at each joint, but where the plants have been in bearing some time, or have been overcropped, allow a few extra vines to run, removing all old leaves as soon as they become discoloured. If greenfly should appear fumigate lightly on three successive nights, always having the foliage dry prior to the operation. Keep the temperature at 70° to 75°, and the bottom-heat at 85°. Plants in hotbeds will be better to have the fruits laid on slates, to secure them against being blanched. These frame plants do not require so much feeding as those grown on trellises in pits or houses, as the roots penetrate into the manure composing the hotbed. *W. M. Baillie.*

THE KITCHEN GARDEN.

HINTS IN SEASON.—Beet sown early in heat will require to be pricked out into light soil, using frames which can be shut up at night. Brown Cos Lettuce in pits should have plenty of water, with an occasional dose of liquid-manure, and be tied up for use as required. The planting of all late varieties of Potatoes should now be finished as soon as possible; Cabbage beds should have the surface-soil carefully stirred with the Canterbury hoe after heavy rains, in order that the plants may obtain the full benefit of the sun-heat, and to prevent the growth of weeds.

Seeds to be Sowed.—White Cos Lettuce, Brussels Sprouts for the latest crop, Scotch and all other Kales, Savoys, Rosette Colewort, Chou de Burgley, and all varieties of Broccoli. Of the latter it is well to reserve a portion of seed of the latest kinds for sowing a month hence. The above should all be sown on a fairly rich border in shallow drills 2 inches wide and 9 inches apart in preference to the broadcast system of sowing, and be at once protected with nets from loss by birds. A good quantity of Marrowfat Peas should again be sown. These will produce a more abundant crop if the rows stand 20 or 30 feet apart, as they then are benefited by the greater amount of sunlight and air that reaches them. This can easily be arranged at this season by running rows at intervals between other crops. Turnips Early Milan and Snowball, Spinach, Asparagus, and Seakale may likewise be sowed; and as the last two crops usually remain for two years before they are lifted, they should be sown on well prepared ground into which plenty of manure has been dug. *W. H. Divers, Kelton Hall, Stamford.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, APRIL 24 } Royal Horticultural: Scientific, Fruit and Floral Committees meet.

SHOWS.

TUESDAY, APRIL 24 } National Agricola (Southern Section), at Victoria Street, S.W.

WEDNESDAY, APRIL 25 } Ancient Society of York Florists.

THURSDAY, APRIL 26 } Royal Horticultural Society of Ireland.

SALES.

MONDAY, APRIL 23 } Cattleya Lawrenceana and other Orchids, at Protheroe & Morris' Rooms.

TUESDAY, APRIL 24 } Orchids in flower, at Protheroe & Morris' Rooms.
Carnations, Picotees, &c., at the City Auction Rooms, by Protheroe & Morris.

WEDNESDAY, APRIL 25 } Importations of Orchids from Messrs. H. Low & Co., and 5000 Lillium auratum from Japan, at Stevens' Rooms.

WEDNESDAY, APRIL 25 } Lillium auratum, Freesias, Cape Bulbs, and Carnations, &c., at Protheroe & Morris' Rooms.
Stove and Greenhouse Plants from sample, at Protheroe & Morris' Rooms.

THURSDAY, APRIL 26 } Importations of Orchids, from Mr. F. Smuler, at Stevens' Rooms.
Specimen Plants, at Messrs. T. Jackson & Sons' Nurseries, Kingston-on-Thames, by Protheroe & Morris.

FRIDAY, APRIL 27 } Portion of the Collection of Established Orchids, the property of C. Dorman, Esq.; also Imported Orchids, at Protheroe & Morris' Rooms.

The Ghent Show.

THE preparations for the opening of the great Ghent Show on Saturday last were somewhat interfered with by the unexpected visit of the King of the Belgians and his suite before the organisation of the Jury was well completed, and hence a certain amount of delay and more confusion were inevitable. It is, however, a matter for pride and satisfaction to us to have to record that among the very first procedures was the presentation by His Majesty, to our most valued correspondent, Professor REICHENBACH, the President of the Jury, of a Gold Medal in recognition of the invaluable services rendered by him for so many years, mainly through the medium of these columns, to all interested in Orchids, either commercially or as amateurs. The inscription on the Medal runs thus:—

Viro clarissimo
REICHENBACH Hamburgensi
qui Orchideis describendis
de hortorum ornata
per orbem terrarum
optime meritus est
Societas gandavensis
D xv. Apr. A. MDCCLXXXVIII.
hunc numum d.d.

The presentation was made, on behalf of the Royal Society of Agriculture and Botany, with

a few of those graceful, well-turned expressions of which kings and princes have the secret.

The Horticultural Press, represented by the editors of the leading horticultural papers of Europe, also received a flattering acknowledgment from His MAJESTY, who took the opportunity of commending the services of the *Gardeners' Chronicle* when its Editor was presented to him as a Pressman and one of the Vice-Presidents of the Jury. British exhibitors received similar royal recognition in the persons of Messrs. BULL, VEITCH, and WILLIAMS. The KING, who was attended by a brilliant suite and escorted by military, then proceeded leisurely through the show, spending some three hours in the examination of the whole exhibition. On the departure of His MAJESTY the jury commenced their labours. Most of the countries of Europe were represented on the jury, not only by nurserymen and amateurs, but by eminent botanists, among whom we noticed the Professors of Botany from Brussels, Ghent, Liège, Hamburg, Lille, Dresden, Warsaw, Berlin, Leyden, &c. Our own countrymen were dispersed among the different sections, Dr. MASTERS being nominated Vice-President of the Jury and President of the First Section (new plants); Dr. Hogg, President of the Fourth Section (Palms, Cycads, Pandanads); Mr. HARVEY presided over the Tenth Section (Camellias, &c.).

We must refer to another column for an account of the show, which will remain open till Sunday next, but which is too vast to be treated in detail. Moreover, the task of the reporters was rendered unusually difficult, by the delay in the issue of the catalogue and the quite incomprehensible system of numbering adopted—schedule and catalogue differing totally, and the numbering on the exhibits themselves often differing from either, while the labels on the plants were too often undecipherable.

Speaking generally, we should be inclined to say that Ghent, if it be possible, has surpassed itself in this its twelfth quinquennial International Exhibition. Certainly, the Exhibition is larger than ever, and more varied, and this, although certain sections are less well represented than on some other occasions. The Exhibition, as a whole, is one of unusual magnitude, great diversity and general excellence.

The President of the Society, the Count KERCHOVE DE DENTERGHEM, is the life and soul of the exhibition, directing, guiding, supervising every department with an energy that seems proof against fatigue, a skill and a knowledge equal to all demands, and a cordiality of manner that charms every one even more than his extraordinary gift of eloquence.

One thing, and one thing only, casts a shade over this brilliant Exhibition—and that is, the gaps that time inevitably makes in the muster-roll. We miss the brilliancy of MONREN, the learning of PLANCHON and KICKX, the sterling qualities of VERSCHAFFELT and VAN GEERT, not to mention those of our own country, whom the irrevocable decree has prevented from attendance at the present quinquennial floral function.

Large as the accommodation is, it is still, as we have stated, insufficient for the purpose, and hence the general effect of the great hall, in which the larger part of the Exhibition is held, is somewhat marred by the densely crowded groups. The centre of the great hall is, as usual, occupied by a brilliant mass of Azaleas; around the sides of the building are groups of magnificent Palms and stately Cycads, while above the glorious groups of miscellaneous plants tower the slender stems of lofty Tree Ferns. Glowing An-

thuriums and brilliantly coloured Cliveas relieve the monotony of the green foliage plants.

As many of our readers know, while the larger groups in the central hall remain untouched, the smaller ones, which comprise the details which fill in the picture, are entirely re-arranged after the decision of the jury has been taken. The work of effective re-arrangement fell upon Mr. EERHAUTE, a son of a well-known member of Mr. VAN HOUTTE's staff; and considering the difficulties of his task, the overabundance of material, the relatively inadequate space, and the very short time at his command, he must be said to have accomplished wonders.

On an upper floor are spacious rooms destined for the exhibition of new plants, Orchids, Amaryllis, bulbous plants, a lovely series of Bertolonias, exhibited by M. BLEU, &c. Here is the splendid lot of Amaryllis exhibited by Messrs. VEITCH, and which has taken the horticultural world by storm, and secured redoubled honours on the exhibitors. Mr. B. S. WILLIAMS' group of Cyclamens has also excited general admiration, a circumstance that those who are acquainted with his excellent strain will not be surprised at.

In the grounds is a vast annexe, which of itself is a large exhibition of the first class, filled as it is with Ghent Azaleas, Rhododendrons, Camellias, flowering and ornamental foliaged shrubs, Cinerarias, grand plants of *Cytisus racemosus*, and a host of other things. Here Mr. CANNELL upholds the honour of his country by a fine collection of double Cinerarias, trusses of Pelargoniums, and beautiful sprays of Pride of Penshurst Carnation. In addition to this are various small span-roofed houses, one devoted entirely to Orchids, others filled with Azaleas, Rhododendrons, alpine plants, and a charming little collection of terrestrial Orchids, &c. A collection of Babianas, Ixias, and various bulbous plants in one of these houses is very remarkable for the time of year.

Scattered about the grounds are groups of Conifers, not so fine as usual, and some of them badly named; magnificent standard and pyramidal Bays, a specialty of Ghent, exhibited by Messrs. VERVAENE and others; huge tubs of New Zealand Flax, shown by M. DE SCHUYVER; and almost equally large clumps of *Aspidistra*; these strike the attention of the most heedless visitor. Fruit and vegetables are entirely unrepresented.

Exceedingly interesting and curious is the reproduction of the building in which the first exhibition of the now famous Society was held in 1809. This was a wooden shed attached to an *estaminet*, and measuring some 40 feet by 24 feet. Along one side of this humble tenement was a bench or stage, on which fifty plants were exhibited. One prize only was awarded—a Silver Medal—to M. LE BÈGUE, for *Erica tricolor*. The canteen at one end of the building, with its pipes and glasses, has been faithfully reproduced. The matches, composed of dried Hemp-stalks dipped in sulphur, tallow candles of the period, pictures, almanacs, a quaint clock, and thermometer, and various paraphernalia, afford a scene of striking quaint interest. The managers of the present Exhibition have endeavoured to get together as many of the kinds of plants as were shown in February, 1809, as possible, and in this they have been fairly successful, assistance having been rendered from the various botanic gardens of Kew, Leyden, and others. It may be interesting to give the names of the plants constituting the first Exhibition, and most of which were represented on this occasion, *Jasminum glaucum*, *Andromeda lucida*, and *Porlandia rosea* (*sic*), not having been obtainable:—

well as a constant succession of flowers and plants on exhibition. For the purpose of properly displaying the collections which will be formed, it is desired to provide a number of hothouses and conservatories, which, it is suggested, should be erected by exhibitors. The Director-General of the Exhibition, M. BERGER, has just written to the Lord Mayor's Committee to ask if any English constructors are inclined to exhibit buildings of this character. I would draw the attention of those interested to this fact, and to say that I shall be glad to give them any further information as to the conditions under which the buildings will have to be put up, if they will communicate with me at the offices of the British Section Committee, 2, Wallbrook (Mansion House), E.C."

ADIANTUM FERGUSONI.—We have received the following communication from the Director of the Royal Gardens, Kew, with reference to this plant:—"The interest which this fine Fern has excited, induces me to think that it may be worth while to place on permanent record in the *Gardeners' Chronicle* the account which was given me in a letter by the late Mr. W. FERGUSON of its first discovery. *W. T. Thiselton Dyer*.

"Extract from a letter from W. FERGUSON, dated Colombo, April 28, 1885:—"On my return from Putalun, about 85 miles north of Colombo, in November, 1881, I stopped a night at Negombo, about 21 miles north of this, and by a curious coincidence the next house to the rest-house in which I put up, was that of your acquaintance, T. G. DE LIVERA, Esq., District Judge of that place. On walking over to call upon him, I found this Fern, for the first time, in a small pot between plants of *Adiantum tenerum* and *A. Farleyense*, and said to Mrs. DE LIVERA that I thought it was *A. Farleyense*, which had taken a great bound and gone back to be a fruitful Fern. I went on purpose to Negombo a short time ago to trace out the history of this Fern; but I am sorry to say it is involved in obscurity. Mrs. DE LIVERA got the plant from a family of DE SILVAS close by, a member of whose family is said to have got it at a sale of plants at Colombo, and this is all its history in the meantime. Here, in Kelvin Grove, it is a tall, stiff Fern, about 2 feet in height and 4 feet in expansion, growing in coir fibre and in a tub. It has seeded freely here in the walls of wells, and in crevices in walls round my house; in fact it has no barren fronds at all, and the tiny seedlings show no difference from the parent plant when they are quite young. It is surely too robust a plant to be squeezed into any form of *A. Capilluveneris*, and the nearest to it that I can suggest is *A. concinnum*, of which several forms are in cultivation here. But after I get a photo taken of this giant Fern, I shall take up good specimens, with roots and all on, for Mr. MOORE, and Kew. I feel very grateful to Mr. MOORE for the honour he has done me in naming this rare Fern after me, and for Mr. BAKER for all the trouble he took respecting it."

NOTTS HORTICULTURAL AND BOTANICAL SOCIETY.—At the last monthly meeting, held at the Nottingham Mechanics' Institute, for the purpose of hearing a number of papers read on "The Duty of the Gardener to his Employer," for which three money prizes had been offered by Mr. S. THACKER, Mr. J. BOOTH presided. After Mr. WOODWARD had read the essays under their respective *noms de plume*, the prizes were awarded by ballot, the result being:—1st, Mr. N. H. Pownall (gr. to Mr. F. Wright, Lenton Hall); 2nd, Mr. J. H. Walker (gr. to Mr. J. W. Lewis, Hardwicke House, The Park, Nottingham); 3rd, Mr. St. T. Wright, Glewston Court Gardens, Hereford.

FRUIT GROWING IN HAMPSHIRE.—A meeting of persons interested in the fruit-growing industries, chiefly Strawberry cultivators from Farnham, Botley, and the vicinity, was held on Wednesday, April 11, at the George Hotel, Winchester, under the presidency of the Mayor of the City, Mr. T. E. KINNY.

HORTICULTURE IN CALCUTTA.—From Mr. JADRU CHUNDER BISWAS of the Empress Nursery, Calcutta, we have received a photograph showing a group of miscellaneous plants exhibited by him at a recent flower show in Calcutta. The plants are what here would be classed as stove-plants, including tree Ferns, Palms, Nepenthes, Marantas, Tillandsias,

Dracena Goldieana, *Eucharis*, *Anthurium*, and many others. For the good natives of Calcutta it is doubtless a matter of satisfaction to see the plants that form the adornment of European conservatories, but for the British element surely it would be far more interesting to see specimens of the native flora. The photograph before us is interesting as showing what may be done by enterprise and skill, but we do not want photographs from Calcutta to show us plants with which we are familiar from every day contact. On the other hand, representations of the flora of the country would have far more interest for us at home, and we expect also for the British residents at Calcutta. Think of this, Mr. JADRU CHUNDER BISWAS.

HORTICULTURAL SOCIETIES' SCHEDULES.—Of these seasonable compilations there are before us—Winchester, announcing a general show on July 12, and another, on November 13 and 14, of Chrysanthemums. The statement of accounts shows a loss on the two previous years of more than £29 in all. Brighton Chrysanthemum Society intends to hold its show on November 13 and 14. The balance-sheet indicates a better financial state than Winchester, the balance in hand at the end of 1887 being £43 3s. 9d., but does not show so well as in 1886, when the balance was £82 9s. 5d. It is evident that these two important Southern societies are either spending more than they should in providing amusements for their patrons, or that the horticulture-loving public and the gardeners are not contributing to their support as they once did.

CINERARIA BLOOMS.—Some specimen blooms of their Brilliant prize *Cineraria* have been sent us by Messrs. J. CARTER & Co., Holborn, which are, as regards the size, substance, &c., equal to any that we have seen elsewhere. A flaked variety is a break in colour; Snowflake, a pure white, is very good; and the quilled flower, Emperor William, is very distinct. They have at the present time something like 500 plants in full flower at their nurseries, and which are well worth inspection.

APPLES FROM THE CAPE.—We learn from the *Agricultural Journal*, Cape Town, that nine cases, containing approximately 10,000 Apples, have been shipped per *Athenian* and *Trojan*. The Agent-General here, who will receive them and arrange for their sale in London, will also report on the result of the experiment. The fruit is the produce of the districts of Stellenbosch, Tulbagh (Ceres), and Queen's Town.

REFLEXED JAPANESE CHRYSANTHEMUMS.—The Revision Committee (Messrs. LEWIS CASTLE, GEORGE GORDON, and HARMAN PAYNE) appointed by the National Chrysanthemum Society to tabulate and arrange the returns for the new catalogue, have prepared the following list of reflexed Japanese as a guide to growers intending to compete in the new classes provided for these varieties. It must be pointed out that the varieties named as Japanese reflexed are only excluded from the true reflexed class; they can be shown in all the Japanese classes as before. Nearly two-thirds of the thirty members of the committee have named varieties they consider should be classed in the new section, and a total exceeding sixty varieties have been thus mentioned. The following twenty-four have obtained the highest number of votes, and will form the select list recommended by the committee for exhibition. They are arranged in the order of merit as determined by the votes, and those that are also specially adapted for culture as specimen plants are indicated by an asterisk:—*Elaine, *Maiden's Blush, *Triomphe du Nord, *Dr. Macary, La Triomphante, L'Adorable, Magdaleine Tezier, *M. Astorg, Amy Furze, Jeanne Délaux, Père Délaux, M. John Laing, *Val d'Andorre, *M. Henry Jacotot, *Flambeau, Gorgeous, *La Nymphé, Criterion, *L'Africaine, *Roseum superbum, Phœbus, *Margot, *Wm. Holmes, and *Tendresse. A few have advocated transferring Cullingfordi to the Japanese reflexed section, but the majority are in favour of its retention in the true reflexed class.

As for Ghent hospitality, it knows no bounds, its only fault is its profusion. The grand banquet to the Jury, presided over by the genial and learned Count DE KERCHOVE, and attended by two of the Ministers and a large number of local celebrities, was a truly magnificent affair.

The members of the Belgian Horticultural Press also invited their colleagues of other nations to a friendly dinner, over which Count DE KERCHOVE presided with his usual eloquence, and more than his customary humour. We cannot pass over this reference to the Belgian Press without mentioning a veritable *tour de force* accomplished by the *Revue de l'Horticulture Belge*, of which Count DE KERCHOVE may be styled the *redacteur en chef*. On the Sunday evening, at the banquet to the jury, each member found beneath his plate a copy of the *Revue* with a long and detailed account of the Exhibition which had only been opened in the morning. This smart piece of business deserves commendation on the part of those who can appreciate the difficulties of the task.

The International meeting of horticulturists, after a long discussion, condemned the Phylloxera laws, and advocated Free Trade in horticulture.

We should egregiously fail in our duty if we did not emphatically express our sense of the very cordial welcome afforded to our compatriots.

THE ROYAL HORTICULTURAL SOCIETY.—A meeting of fruit growers, florists, nurserymen, seedsmen, and commission salesmen, will be held in the rooms of the Covent Garden Club, at the hotel of the same name, on Monday, April 23, at 9 P.M., to discuss the question of co-operating with the Royal Horticultural Society in the advancement of horticulture. The attendance of all interested is requested. Mr. J. B. THOMAS, Covent Garden, is the president of the Club.

THE HORTICULTURAL CLUB.—The usual monthly dinner and *concezzazione* were held at the Hotel Windsor, Victoria Street, which is likely to be the future quarters of the Club, and was attended by a large number of the members, amongst whom were Mr. J. Lee (Chairman), the Rev. W. Wilks, the Rev. F. H. Gall, Messrs. Crowley, H. J. Veitch, H. I. Pearson, C. J. Pearson, Geo. Paul, and James Walker. The arrangements were considered to be in every respect an improvement. In the evening an admirable paper was read by Mr. James Walker on "Daffodils," and a discussion was entered upon afterwards, in which Mr. Wilks and others took part.

PARIS UNIVERSAL EXHIBITION, 1889.—We have received the following communication from Mr. H. T. WOOD, Hon. Secretary to the British section of the above undertaking:—

"Amongst the attractions at next year's Paris Exhibition it is proposed to have flower-shows, as

NATIONAL AURICULA SOCIETY (SOUTHERN SECTION).—The following has been received from Mr. J. DOUGLAS, Honorary Secretary:—"Circulars have been issued to all the members of the Society informing them of the arrangements for the exhibition to be held in the Drill Halls of the London Scottish Volunteers, James Street, Westminster, on the 24th inst. I am writing this note on the 14th, and a few days ago the prospects of the Northern exhibitors getting their plants in was problematical. Now things are much more promising for a good show. One of the leading Northern exhibitors intends to be present, and I hope to hear that more will be able to say they will come south in a day or two. I hear the flowers have come in rapidly since the change in the weather. When vegetation has for long been held in suspense by adverse weather it is astonishing how rapidly it moves with a favourable change. I hope members and exhibitors will not only attend in force themselves, but will also bring their friends with them. An excellent luncheon will be provided at the Hotel Windsor, quite close to the Drill Hall, at 1.30 P.M., tickets for which may be obtained from the Secretary or the Chairman of Committee, the Rev. H. H. D'OMERAIN, Hotel Windsor, Victoria Street, S.W., also from any member of the committee. The Council of the Royal Horticultural Society have kindly placed the Drill Hall at the service of the Society, and Mr. BARON will receive the entries from exhibitors as usual. Other spring flowers besides Auriculas are likely to be exhibited, forming a really good spring show, and a large attendance of visitors would make things lively and pleasant all round."

EFFECTS OF THE WINTER 1887-88 IN THE SOUTH OF FRANCE.—The winter has proved disastrous to many of the supposed acclimatised plants in the littoral region of the South. M. NAUDIN, in *Le Bulletin de la Société d'Acclimatation*, gives a dismal list of losses and injury at the Villa Thuret. Most of the *Acacia*, *Aberis Myoporium*, *Rhus*, and *Polygala*, have had their leaves destroyed. *Phoenix spinosa*, *Livistonia australis*, *Eucalyptus Ravertiana*, *maculata*, *citriodora*, and *helicifolia*, with *E. globulus*, *cornuta*, and others, are cruelly injured; but, on the contrary, *Eucalyptus viminalis*, *urnigera*, *rostrata*, *crebra*, *resinifera*, *linearis*, *Muelleri*, *cordifolia*, *gomphocephala*, and *microtheca*, are quite unhurt. *Jubaea spectabilis* and *Phoenix canariensis* have proved themselves to be insensible to the frost.

LINDFIELD CHRYSANTHEMUM SOCIETY.—The committee of the above Society having decided to give an entertainment in aid of the Gardeners' Orphan Fund, arrangements have been made for holding the same on Wednesday, April 25, in the Assembly Rooms, Lindfield, under the patronage of the Hon. A. E. GATHORNE-HARDY, M.P., and Lieut.-Col. DUDLEY SAMPSON, J.P. Mr. A. J. BROWN is the Chairman of Committee, and Hon. Local Secretary of the Gardeners' Orphan Fund.

SHOW FIXTURES.—The Newcastle-upon-Tyne Autumn Show—always looked forward to in the North of England—is fixed for August 22, 23, and 24, in Leazes Park. Valuable money prizes are offered, amounting in all to £342 14s., and the Royal Horticultural Society's Medals for twenty-four Hollyhocks, and for a vase or epergne of cut flowers. The schedule of the Bath Floral Fête Committee's shows is to hand for the exhibitions on May 16, July 5, and November 7 and 8. The Veitch Memorial Medal and £5 are offered for eight Chrysanthemum blooms (four large incurved flowered and four Japanese), at the last mentioned show. At the Rose Show (in July), two National Rose Society's Medals are offered for single best blooms in the display, and Silver Cups and money equivalents in other classes, and also a Gold Medal and cash as prizes for local amateurs. Another exhibition will take place on September 5 and 6, when, as the British Association will be visiting Bath, on that occasion large prizes will be offered, and the schedule will appear at a later date.

HOME CORRESPONDENCE.

NEW FELLOWS FOR THE ROYAL HORTICULTURAL SOCIETY.—Your obliging insertion of my letters continues to bring in names of candidates for Fellowship. In this neighbourhood, within a walk from my house, thirty-nine owners of gardens themselves and two of their friends have added their names to the list of guinea and two-guinea Fellows, while some have not yet answered, and others have not yet been written to. I have little doubt that we shall make the number up to fifty owners of gardens. Surely this proves that if ladies and gentlemen are shown that they owe a debt to the Society for the work it has done, and is doing, to improve horticulture, and that if friends of the Society will take a little trouble each in her or his own district, a very large increase in the number of Fellows will result. An influential friend, who feels as strongly as I do the importance of moderate subscriptions, has done in his neighbourhood (Chislehurst) what we are doing here, *George F. Wilson, Heatherbank, Weybridge Heath*.

MEETING DAY OF THE ROYAL HORTICULTURAL SOCIETY.—The note on this matter at p. 495 is opportune, as the success of the Society will depend on the amount of patronage it receives, and therefore no effort should be spared in trying to make its meetings as convenient to distant patrons as to local ones. At present local supporters have the best of it, as it is required that objects sent for the opinion of the Fruit or Floral Committees be delivered by 10 A.M., which rule, however, is by no means rigidly enforced. The committees sit at 11 o'clock, and this last hour may be taken as the extreme limit. Now, this hour is too early to admit of parcels being delivered with anything like certainty when despatched from a distance on the previous day; the consequence is, that supporters around London are able to avail themselves of the advantages of the meetings to a much greater extent than are provincial people. As a remedy it has been suggested that the day of meeting be changed, but several difficulties present themselves here. I presume no one would suggest either Monday or Saturday, while Wednesday or Thursday would, it seems to me, place the Horticultural Press (which does much to further the Society's interests) at a disadvantage, owing to the time of publication. I do not argue that the Royal Horticultural Society ought to be guided solely by these considerations, yet possibly they are worthy of more than a passing thought. It has occurred to me that what is desired could be accomplished by altering the hour of meeting instead of the day. Suppose that 1 o'clock were the hour for the committees' meeting. They would still have time left to get through their work, and I see no reason why the Fellow and public should not be admitted at the same time as the committees' commence their labours, for it could hardly be seriously urged that they would, in any appreciable degree, impede the progress of business; indeed, I think this little alteration would prove both agreeable and advantageous to all who take part in those meetings. At present some exhibitors and committeemen must start at an hour so early that the whole day is taken up, but if the hour were later business men would be able to see to the morning's letters, &c., before starting, or in the case of a gardener he would be able to see that everything was in order for the day. Moreover, if these people wished to transact any little business in town it would be better if they were able to get this through before coming to the meeting. They would not then have to hurry away (now frequently the case) as early as possible after the committee had risen, to which bodies these last remarks more particularly apply. This arrangement would permit the majority of parcels posted on Monday being delivered in time. But the parcel-post is by no means the best medium for conveying fragile objects, and many would prefer sending by passenger train, in which case parcels despatched early on Monday, from any part of Great Britain and the chief Irish ports, would be delivered in time. For example, the train leaving Aberdeen at 5 P.M., and Perth at 7.30 P.M., Monday evening, arrives in London by 8 next morning, so that this late train would leave between four and five hours for delivery; but parcels could be in London by 4 A.M. if despatched by the earlier train. It appears that all that is required to enable distant exhibitors to forward their things in time, without

standing over Sunday, is merely to postpone for two hours the time of opening. *F. B.*

RICHARDIA ÆTHIOPICA.—The advantage of planting this plant out in the open during the summer—a practice largely followed by many of the growers of this useful subject round London—is seen in some very fine specimens Mr. J. Davidson has in the conservatory at Highfield Park, Heckfield, Hants. The plants are in 9-inch or 10-inch pots, they are most luxuriant in growth, and have each thrown up three and four and more very fine growths: they bloom with remarkable freedom, and produce spathes of very large dimensions. The plants are turned out of the pots and planted in good soil in the open ground as soon as it is safe to do so; there they remain during the summer, and in the autumn they are lifted and potted in rich soil, and brought on gradually into bloom. Some of the specimens are of very large size, and form conspicuous objects in the house in which they are flowering. *R. D.*

DOUBLE DAFFODILS.—An interesting example of the way in which Nature can be accelerated in respect of the expanding of double Daffodils was noted in the early vinery of Messrs. W. & E. Wells' gardens, Hounslow. A large iron cistern, a bath, and several pails, each containing water, were all crum-full of bunches of double Daffodil buds—for they were simply buds, without an atom of colour being visible when cut. Thus subjected to warmth with ample moisture for the stems to absorb, the blooms expand freely in twenty-four hours, indeed, whole bunches of buds thus forced have been found fully expanded after but one single night's subjection to the heat. It is obvious that if the flowers are left outside until opening naturally they will but turn in with the general bulk, and that bulk is enormous. Double Daffodils are usually serviceable at Easter, but this year, to the harm of the flower growers, Easter was too early and the season too late. *A. D.*

EUCHARIS AMAZONICA.—Permit me to draw the attention of Mr. A. Macdonald to what I think with good cause to be quite a mistaken idea. On p. 403, March 31, in writing of his own success with these plants and his neighbours' failures with the same, Mr. Macdonald says:—"I am of opinion that as long as they are kept in robust health the mites will not attack them." This is certainly an erroneous idea, of which I have had ample proof for a long time past whilst watching healthy *Eucharis* and the mite thriving well together. My experience is (and has been worked out by a series of long and carefully-made experiments) that, if from any cause the *Eucharis* become unhealthy, every wound made by the mite is at once attacked by the fungus—probably the yeast fungus—so fully and ably described and illustrated by Mr. Grove in your issue of March 27, 1886, and that this fungus seems to spread more rapidly on bulbs and their roots in light soil, rather than in strong loam. I have been carefully watching two lots of plants which are growing side by side in a stove, plunged in ashes, in strong bottom-heat; the one lot, in strong loam, are robust and healthy, but infested with the mite, and to a certain extent with fungus. The other lot is not thriving in the light compost, the plants unhealthy and miserable looking, with every wound made by the mite, a dull red mass of fungoid disease, and the roots for the most part rotten. For bulbs thus badly affected I am of the opinion that there is no cure, having tried almost every known remedy without success. The starving method which Mr. Macdonald refers to is undoubtedly the cause of numberless failures with *Eucharis*, and I quite agree with him that so long as the plants are kept growing freely they may be kept in good health even when infested with mite; but as soon as the plants receive a check, either by withholding water or placing them in a cooler house with a view to flowering them, the mite then undoubtedly gains the mastery, and the plants get into bad health; and once in that condition it is impossible for them to recover. But I am convinced that *Eucharis* do not flower so freely when always kept in the same condition as when they are to a certain extent dried off. But the practice followed by many gardeners, viz., that of removing the plants when they have completed their growth in a stove, where they have had perhaps a good bottom-heat, and placing them in a house, say of 15° colder, is certainly contrary to sound practice. Plants free from the mite will doubtless stand the treatment without any visible injury, but let the plants once get infested with mites then the practice must be abandoned. Manure-water used carefully is un-

doubtedly very beneficial to Eucharis, both in growing and flowering, but I am of opinion that rotten manure and leaf-mould used when potting is conducive to the increase of the mites and fungi. But half crushed bones used in the place of so much rotten manure is undoubtedly far preferable, serving not only as a substantial manure, but as a material to keep the soil open, and assist the percolation of water. *C. B. Kestley, Torquay.*

GROWING CHRYSANTHEMUMS AGAINST SOUTH WALLS FOR DECORATION.—I have to thank you for permitting me to commend this method in your columns, more especially as it is a departure from the orthodox system. There is, however, no reason, as in Mr. E. Molyneux's case—Swanmore Park—why the various methods should not go on side by side, *pari passu*. I, however, want the wall system to get a fair chance, and this is why I took exception to Mr. J. Horsefield's suggestion (p. 303) to "turn out the old stools, and reduce the balls to one-third of their bulk, and plant firmly"—that is, to plant the old stools; but this I never do. My method—very fully described last December by Mr. Dumper, Summerville Gardens, Limerick, in *Gardening World*—and I presume of many others, is to specially prepare the border in front of the wall, best soil and richest manure, 2 feet deep and more wide, and plant with single rooted plants any time from mid-February when convenient. My plants were snowed-up and repeatedly frozen under a layer of dry hay since that date, and now seem not to have lost a leaf by it. All the newest and best varieties are included, and I may at once state, with proper thinning, disbudding, and nailing out of the shoots as they develop while reflexed, do best—none fail. They are protected by an overhanging eave and with tiffany in November and December, and then numbers are pleased to see them. This wall would be bare and utilised otherwise. Are there not thousands of similar cases that could be made objects of great interest for nine months out of twelve? There are 300 varieties there now, pictures of health. *W. J. Murphy, Clonmel.*

VIOLETS AND WALLFLOWERS.—We have rarely had a worse season for these favourite sweet-scented flowers than is the present one. In ordinary good years vast quantities of the fine dark red Wallflowers would now be crowding the market vans, furnishing labour on the one hand and remunerative returns for the grower on the other. Now the plants are almost bare of flowers, for the check to the plants given by the last year's drought has not been alleviated by the long cold spring, which assists nothing and checks everything. Violets, again, usually in their full height of flowering, and providing abundant labour for hundreds of women in gathering, are but a miserable dribbling crop, and fully 60 per cent. below the average of produce this time last year, and still more than is found in a really good Violet year. We have had no actually good Violet seasons for several years. Still nothing checks the determination shown on every hand to increase breadths, in view of a possible good season somewhere. *D.*

FRUIT RATES OF TRANSIT, &c.—The large body of fruit growers whose field of culture is found in South Hants have taken up arms against what are regarded as the excessive charges of the railway company for carrying their fruit from the local stations to London. The commission of the London salesman also forms the subject of severe criticism, these averaging 12½ per cent., inclusive of certain market dues; and as the rail charges amount to 7½ per cent., no less than 20 per cent. of the grower's profits are absorbed in these two items alone. It is therefore no subject for wonder that the growers should not only rebel, but should also combine to endeavour to bring about some appreciable improvement. What is sought for is, first, a very material reduction in the rail charges for the transit of the fruit to the market; and, second, some scheme by which the local gardeners could have their own salesman, who would undertake to dispose of the fruit consigned at a very moderate commission. To that end it is proposed to form an association of local growers which the special salesman should represent, and if any growers refused to join the association they would have to accept the responsibility of their isolation. The local growers, who seem to be chiefly engaged in the production of Strawberries, state that they send not less than 350 tons to the London market annually—an enormous quantity, and producing on the average £31 2s. 11d. per ton, or a total of about £13,000 in one season.

These figures demonstrate the importance of the Strawberry growing trade of Hants. The deduction of about £10 per ton for transit and sale is a big amount, and serves to show how largely land products help to enrich carriers and middlemen rather than the actual producers. The injustice of the present system of rail charging for transit over some sixty to seventy miles is shown in the fact that one truckload of fruit would, in many boxes from diverse consignors, come to as much as £10; indeed, as some seven or eight truckloads were often sent away in a single night, the cost of transit came to some £70 or £80. The charge for a single box of fruit to London averaged 2s. Of course were an association formed the fruit could be consigned solely by the manager or secretary to the salesman at tonnage rates, and the saving in that direction alone would be enormous—far more than repaying the charges incidental to the maintenance of the association. Whilst the oppressive nature of the charges upon the growers is thus clearly set forth, it is made obvious that only by combination can a remedy be found. Even if Parliament rendered the abatement of the rail charges compulsory—and it is very doubtful whether it will go very far in that direction—growers have the matter very largely in their own hands, when they agree to combine and send their fruits over the railway as a single consignment at a very considerable reduction of cost. The question of the payment of middlemen or salesmen is far from being a new one, but is necessarily incidental to a state of things which prevents the grower from selling in person as the metropolitan market gardeners do, thus enabling them to retain the whole of the resulting profits. If growers will consign to ordinary salesmen they must take the consequences; whilst if they combine to retain the services of a single salesman at a very reduced rate of commission, they may find certain market influences antagonistic, and in that way, perhaps, prevent the fruit from securing its full value. The matter is surrounded by difficulty, and needs to be very boldly faced. In the interests of fruit culture it is important facilities of sale should be ample and helpful; and if the association of the South Hants' growers can create greater facilities, no doubt growers everywhere will reap the benefit. *Spade.*

SCENTED-LEAVED PELARGONIUM FAIR HELEN.—I was at Highfield Park, Heckfield, Hants, the residence of F. Marson, Esq., a few days ago, and saw against a trellis at the back of one of the plant-houses a large plant of this charming Pelargonium, which, in addition to a sweetly fragrant foliage, has also very pretty light well formed flowers, like those of a small fancy Pelargonium, produced on numerous compact trusses. It is a good grower and remarkably free, and the plant—planted out in a border—seemed to be in a position that suited it exactly. It is very continuous in bloom, and can be said to be in bloom all the year round. Fair Helen was the name given to it by Mr. J. Davidson, the gardener, and it may be recognised by some under this appellation. Its value for cutting from can scarcely be over-estimated, and I should think it would make a delightful summer bedding plant. *R. D.*

WANTED, A GARDENER.—We are glad to see in the editorial foot-note to the remarks and suggestions of "Querist," under the above heading, that there is some hope of a revival of gardeners' examinations, that were held some years ago under the auspices of the Royal Horticultural Society, and more particularly of young practitioners. Those who have any ambition to excel in their occupation, should not delay to prepare themselves for this test of their knowledge of gardening and general subjects. Any candidates who can successfully pass an examination such as that required by the Society should, and we firmly believe would, have a distinct advantage in these days of competition in obtaining posts suited to their abilities. The requisite study of the various subjects included under the head of horticulture combined with actual practice, which are requisite to pass the examination with success, will be time well spent, and will not be a matter of regret in the future. The plea of not having sufficient time for study can hardly be urged by many, and the aids to a preparation for an examination are so very abundant in the horticultural literature of the present day, that no reasonable excuse in that direction can be made. We do not in the least reflect on the way in which young men spend their spare hours, but we would impress the fact on their minds that those who give the most time and the greatest determination to

their improvement, and become well versed in all matters pertaining to their profession, are those who in the future will stand the best chance of obtaining the better class of situations. Such certificates as a candidate may obtain would beneficially supplement the recommendation of former employers. It must be borne in mind by young gardeners that the education of the present day is far in advance of that afforded only a few years ago, and will tend to force many competitors out of the field who may be a few years their seniors. Theory we well know is useless to a gardener without practice, but the two combined, if backed up with good general education, will make the road to success much more certain. When well equipped for his work by education how much easier become the various operations in a garden to a gardener, as he then not only knows how to do a thing but also why it is done. Some twenty years back we had an ambition to go up for the exams. of the Royal Horticultural Society, and in some of the succeeding years did so, the result being one of entire satisfaction, and we never regretted the time spent in preparation. There were some persons who said they did not see the use of such things, and were inclined to dissuade us from the course of study received. I have now in my mind several who passed just about the same time, and who are now doing well (Messrs. Wynne, Lynch, and Burbidge, for instance). I hope with you, Mr. Editor, to see a revival of these examinations, and in no better way can this be done than under the auspices of the Royal Horticultural Society. Published results of all examinations should be given prominence, for the benefit of those who pass the same and as an incentive to others. *J. H.*

—It was with the greatest interest that I read the article under the above heading in a recent issue. Surely something can be done for us young gardeners who are in want of situations. Your correspondent makes mention of the Colonies. I am sure that there are hundreds of young gardeners who would emigrate immediately if there was the least prospect of suitable situations. [An emigrant should not always think of the suitability, &c.] Certainly a large majority of young recruits will agree with me when I say that I hope the proposition made by "Querist," referring to the possibility of the Royal Horticultural Society issuing certificates of efficiency, will receive early attention from that body. What can be more just than to let gardeners have the situations who prove themselves fittest for them? For do we not know that there are many situations filled by men who are not competent, and who have never served an apprenticeship or in any other way acquired a knowledge of their business? There can be no doubt that if the granting of certificates could be carried out it would make matters much better for gardeners and help to improve their profession. *R. Larcombe, Harbury, Carlisle.*

BEES.—The long spell of cold weather, and the unusual absence of spring flowers, owing to the lateness of the season, may lead to dysentery among the bees. Its presence is indicated by yellow spots and foul odour. It is recommended that stocks suffering from this should be at once moved into clean hives, the old hives being washed on the inside with a weak solution of carbolic acid. If the weather is not warm enough for the change to a clean hive being made in the open air, it should be carried to a warm kitchen or any suitable place indoors, and the transfer made there. *R. D.*

THE HARDY FRUIT GARDEN.

DISBUDDING.—This operation must now be commenced, the young shoots on Peach and Nectarine trees being sufficiently developed that they can now be easily rubbed off. The operation of disbudding requires care in carrying it out, and should be done not all at once, but at three or four different times, allowing an interval of five or six days between each, until the trees are finally disbudded for the season. As a commencement, remove all the fore-right shoots—those which grow at right angles, or nearly so, with the wall; then by degrees reduce the number of those on the sides of the branches, but be sure to leave the two lowermost buds on a shoot, as these will be the bearing wood of the next season. Young trees require treatment rather different, as shoots in sufficient number must be left for their

formation and extension, so that the wall or fence may be covered quickly.

Grafting.—The weather has been very favourable for this operation, which should be proceeded with as expeditiously as possible, the sap being rapidly on the ascent. If clay be employed it is a good practice to bind some moss over the clay, by which means the cracking which always takes place from shrinkage will be averted. *A. Ward, Stoke Edith Gardens, Hereford.*

SOCIETIES.

INTERNATIONAL HORTICULTURAL EXHIBITION AT GHENT.

THE Royal Society of Agriculture and Botany of Ghent opened their Quinquennial International Exhibition on Sunday last. In another place brief allusion is made to the history of this powerful Society, and to its modest beginning. As the show will not be closed till the evening of the 22nd, and the journey from London occupies only some eight or nine hours, there will be still time for gardeners to visit this remarkable exhibition, from which they cannot fail to learn some useful lessons. In proceeding to note a few of the details of the present very magnificent exhibition, we do so with a sense of the difficulty of the task, arising from the magnitude of the show, our own limited space, and the inconvenient system of numbering the exhibits, so that it is difficult, and in some cases impossible, to ascertain to whom certain groups belong.

NEW PLANTS, &c.

New plants of a distinct character and likely to make a useful future were few and comparatively unimportant. A 1st prize was awarded to M. Paul de Hemptinne for a remarkably white variegated form of *Vriisia hieroglyphica*, and 2nd, to Mlle. Block, for a very extraordinary Bromeliad with ornate leaves, 2 feet in length and 9 inches in width and of a peculiar reddish tint.

M. E. Pynaert van Geert exhibited some very good novelties: *Begonia Lubbersii* has the colour somewhat of *B. Rex* with the habit of *B. argyrostigma*, but the leaves are peltate and sharply pointed at each end. *Adiantum Regina*, *Pteris tremula grandiceps*, and *Gymnogramma elegantissima* (a form of *G. schizophylla*), and some new and rare Palms and other plants coming from him; *Begonia Louise Closson* and *Boronia heterophylla* in the exhibits of MM. Fr. Desbois & Co., were noteworthy.

The *Alocasia* (of the *Veitchianus* section), Comte de Kerchove President, sent by M. E. Vanden Abele & Co., was also the best thing in its kind; and MM. Jacob Makoy & Co., of Liège, sent some rare and interesting Aroids, Bromeliads, and other plants. Among MM. Jacob-Makoy's plants may be specially mentioned the handsome new Fan Palm, *Bismarckia nobilis*, the curious *Nepenthes picturata*, an Aroid from the Congo, with hastate green leaves with white raised blotches on the upper surface looking like a paper pattern affixed to the upper surface of the leaf. *Alocasia Leopoldi*, shown in this section, has bluish-green deeply toothed leaves.

M. Van Houtte shows a collection of *Nepenthes*, but lacking the colour we are accustomed to see in Messrs. Veitch's plants.

Dichorisandra pubescens var. *taniensis* of M. Ed. Pynaert van Geert seems likely to be a plant in general demand. M. Pynaert also shows a handsome new *Begonia* with claret-coloured foliage sprinkled with white hairs and with pendulous racemes of pink flowers. The new plant is called *President de Bonreilles*.

The principal prize takers in this section were MM. Jacob-Makoy, Desbois et Cie, J. Hye Lyeysen, A. Van Geert, Pynaert, Van der Cruyssen, Vuylsteke, and the plants exhibited by them are for the most part noted under special headings.

ORCHIDS.

These certainly formed one of the most beautiful and considerable features in the exhibition—a feature long to be remembered by all who were fortunate enough to see it, tastefully arranged as they were in the various galleries, all the accessories of Maiden-hair Ferns and other foliage plants being duly studied, with much advantage to the general effect. The

chief interest was centered in the fine arrangements in the end gallery, which contained the collection which secured the Gold Medal given by the Queen of the Belgians for the largest and most meritorious collection. This coveted prize was secured by Mr. A. Peeters, of Brussels, with a fine lot of over one hundred well grown and flowered plants, many of them large and rare examples. Prominent in the group appeared a fine variety of *Cymbidium Lowianum*, *Odontoglossum Jenningsianum*, *Lycaste Skinneri alba*, *Celogyne cristata alba*, *Laelia grandis*, fine; *L. purpurata*, *Cypripedium Schroderae splendens*, *C. Sedeni candidulum*, *Odontoglossum mulus*, *O. Roezlii*, *Cattleya Warneri*, some *Vandas*, a fine scarlet *Sophranitis*, and a generally uniform lot of good things. The 2nd prize, or rather a special prize, on account of the number of plants exhibited, went to M. Charles Vuylsteke, of Loochristi, Ghent, for a neat collection, quite filling the Orchid-house specially erected in the grounds. In the same class Messrs. Vervaeet & Co. secured the 3rd prize, a Gold Medal, with a good group, among which were a golden-yellow *Odontoglossum*, provisionally named "Masereeli"; some fine *Odontoglossum crispum*, and *O. vexillarium*.

For the best fifty Orchids M. James Bray, of Ghent, was justly awarded the 1st prize, an *objet d'art*, his really fine collection having good examples of *Odontoglossum Harryanum*, *Celogyne cristata alba*, *Cypripedium seligerum majus*, *C. Harrisonianum superbum*, and a grand *C. caudatum*, with a score of fine blooms. MM. Vervaeet & Co. were 2nd, and secured the Gold Medal, with a nice group, containing several *Cattleya Trianae* of good quality. M. De Smet-Davivier being 3rd, with by no means an indifferent collection.

In the class for thirty Orchids (amateurs), M. Jules Hye-Leyssens, one of the most promising and enthusiastic Orchid growers in Ghent, secured the 1st prize (a Gold Medal), with a remarkable group of exceptionally good things, in which his specimen of *Cypripedium grande*, for size, reddish-purple tint of the flowers, and generally high character, presented this grand plant in quite a new aspect, even to its raisers, Messrs. Jas. Veitch & Son. In M. Hye's group, *Cypripedium caudatum*, *Masdevallia Veitchiana*, *M. ignea*, *M. Shuttleworthii*, and *Odontoglossum Edwardii* were especially noteworthy. Jas. Bray was 2nd, his five plants, not usually seen so good, being *Cattleya Schilleriana*, *Chysis bracteescens*, *Miltonia cuneata*, and *Odontoglossum Curradinei*.

In the same class (30), for nurserymen, M. A. Van Geert was 1st, his *Angreum sesquipedale* and *Dendrobium Dominicanum* being especially good; M. Ad. D'Haene was 2nd.

The prize offered by M. le Baron Henri de Ranst de Berchem, in memory of the Comte de Gomer, for thirty *Cypripediums*, &c., brought an interesting competition, although the size of the plants is not equal to that to which we are used in England. M. Hye-Leyssens secured the 1st. This gentleman's collection embraces the lovely and curious *Cypripedium Lawrenceanum* Hyeannum, which may be regarded as a charming albino or colourless variety of *Lawrenceanum*, which it resembles closely in every way, except that the pouch is clear yellow, the dorsal sepal pure white with emerald-green lines, and an entire absence of the red tint of the type. It is a precious novelty in these days of *Cypripediumomania*; his grand *C. Argus Moensii* should also be mentioned.

For the finest lot of fifty *Odontoglossums* M. Vuylsteke, of Loochristi, secured the 1st prize, his group being largely composed of varieties of *O. lanceans*.

For the rest of the numerous classes in the Orchid competition, it may readily be understood that all the classes were not numerously represented, but of exhibits there were plenty, and indeed so many that even with the extensive resources of the Casino a difficulty was found in finding proper room for them. Madame Block, of Brussels, exhibited well, so also the good firm of M. A. Van Geert and others. Strangely enough the prizes for single specimen Orchid brought but one entry—a fine *Cymbidium Lowianum*, with six spikes, from M. Vervaeet; and also that for a new Orchid from seed was adjudged to M. Raymond Lemonier, the only exhibitor, for *Cypripedium Lemonieri*, a very close approach to the *C. calurum* of Messrs. Veitch. *Cattleyas*, *Laelias*, *Vandas*, and some other species were not so well represented as they might have been, the dull, sunless weather having been, in Belgium, as well as with us, inimical to the expansion of the flowers. Enough, however, arrived to make a show, and a good show too.

Perhaps the greatest interest centered in any one object was created by a cut three-flowered spike of a grand form of *Cattleya Trianae*, superb in form and size, and with the additional attraction of a bright crimson marbling on the sepals and a similar broad feather of crimson spots up the wide and conspicuous petals. All agreed that such had never arrived before, or anything like it, and it was suggested to call it *C. Trianae* var. *Courtaldiana*, as it was brought from that gentleman's collection by Mr. O'Brien.

STOVE PLANTS.

Aralias and *Rhopala* were of very fine quality in the collection shown by M. A. Dallière, who won the 1st prize for twelve of the former and eight of the latter. *A. Chabrieri*, *A. farinifera*, *A. leptophylla*, *A. trifoliata*, and *R. corcovadensis*, *R. villosa*, and *R. elegantissima* were most noticeable, but all were excellently grown.

Dracaenas were a strong feature, the plants being represented by finely cultivated specimens throughout, and especially was this the case in the lot of D. Lindeni, from M. E. Vancoppenolle, who evidently is an expert at the treatment of these plants. *Dracaena cinnabadi* was equally well done by M. B. Spaë. M. P. Deschryver took the chief award for a single specimen, having a large and most beautiful plant of *D. umbraculifera*. The collection of thirty, as shown by the Société Horticole Gandoise, was worthy of all praise, such fine plants were shown, splendid examples of culture, and the collection itself a very comprehensive and interesting one—M. L. van Houtte coming as a close 2nd with a case of *Bertolonias*. It may here be mentioned that M. L. van Houtte showed tropical fruit plants and official plants, in both of which classes he took prizes, and was the only exhibitor. A very comprehensive and well-grown collection of fifty *Caladiums* was also shown by this exhibitor, and he was again without a competitor, but he fully merited the award of the 1st place which was made. J. Linden, greenish-white, with red primary nerves, and green secondary; alba-luteum, greenish-yellow; candidum, transparent yellowish-white, green nerves; Lielle, green-red nerves, and white spots, were specially good; D. Lindeol, Massangeana, amabilis, Casanova, Madame Ch. Heine, Madame F. Bergman, Madame Constant Lemoine, Leopold Clere, Triomphe d'Angers.

M. Dallière carried off many prizes besides those already mentioned; he took 1st in each of the following classes, and throughout the quality was excellent:—Twenty-five ornamental foliaged stove plants, ten *Anacochilus*, six *Nepenthes*, twelve *Dieffenbachias*, and twenty *Marantas*. D. Baumani, Regina, Leopoldi, and Bausei were good.

The *Anacochili* were splendid throughout, especially Lowi, Dawsoni, discolor, purpurata, and elegantissima.

In the ornamental class good examples of the following were shown:—*Phrynium variegatum*, P. Lubbersi, *Tillandsia Leopoldi*, *Pandanus Veitchii*, *Dieffenbachia nobilis*, *Cissus porphyrophyllum*, *Anthurium crystallinum*, *Pothos aurea*, &c. *Nepenthes* were only of average merit.

M. A. Bleu, Paris, sent fifteen *Sonerillas* and *Bertolonias* in magnificent condition, and took 1st in the competition.

M. Louis van Houtte contributed greatly to the attractions of the large hall by his well-grown and extensive group of miscellaneous plants, carrying off, as was only just, the highest honours of the section, viz., the piece of plate offered by the Comte de Kerchove de Denterghem; this was a wonderfully rich collection. A splendid specimen of *Anthurium Veitchii*, occupying the central position; the leaves of this plant measured over 3 feet in length, and as they were numerous, it may be imagined that it was a striking object. An almost equally fine specimen of *A. Gustavi* was also shown, but the large cordate leaves of this plant are not so impressive as those of the species before-mentioned. *Licuala grandis* was well shown, and also *Medinilla magnifica*; a large *Dracena Lindeni*, *Davallia Mariesii*, *Alocasia Thibautiana*, *Cochliostema Jacobianum*, a good specimen of the rare *Lycopodium pinifolium*, about 3 feet high; *Zahnia Lehmanni*, *Tillandsia tessellata*, *Brachysema acuminata*, *Arpophyllum giganteum*, *Strelitzia reginae*, *Phyllotanium Lindeni*, and many others of equal merit, indeed the whole fifty were splendid plants. The same exhibitor showed a most creditable group of forty flowering plants, taking the prize offered by M. C. Leirens, Secretary to the Society. One of the most noticeable plants was a well flowered specimen of *Erythrina crista-galli*, and *Clianthus magnificus*, *Metrosideros semperflorens*

grandiflora, *Oncidium sarcodes*, *Arpophyllum giganteum*, numerous hybrid *Rhododendrons*, *Acacias*, *Anthurium Scherzerianum*, *Cytisus*, *Boronias*, and various other subjects were included. The "Société Horticole Gandoise" was a good 2nd in the 1st class, occupying the chief position at one end of the large hall. The group was very gracefully set out and was composed of the following plants among others:—*Anthurium carneum* (a large plant), *Ruellia Daveauxiana* (?), *Attacia cristata* (in flower), *Maranta*, *Kerchoveana*, *Philodendron* M. Elmoni, *Dracena Lindenii*, numerous *Crotons*, and various specimens of common Orchids, with Palms and Cycads of the usual decorative sorts.

Clivias (*Inantophyllum*) are an important class of plants on the Continent, and in Ghent especially, and a large number of the nurserymen have turned their attention of late years to their culture, and the raising of new varieties. No fewer than seven classes were set apart for them, and all were well represented. Wide strides have been made in the improvement of these plants since the last Quinquennial Exhibition, when the finest variety was that named *Madame Donner*, which, beautiful as it still is, must be set in the background to give place to some of the splendid seedlings which were included in the chief collections. The *Inantophyllum* classes were for twenty, twelve, six, three, and single plants. There were several collections of twenty, the finest, which won the valuable *objet d'art* offered by the members of the Council of the Society, being that from M. Bernard Spae, while the other prizes were taken by MM. Boelens frères and M. L. van Houtte. The finest varieties among these collections showed a great advance on those in trade, and the finest in the whole show was that called *Souvenir de F. Vervaeke*. The flowers of this are perfect in shape, sepals broad and rounded, like those of *Vallota*, and the colour is a glowing orange-scarlet with bright yellow centre. The truss, too, is enormous. Next to this in merit was *Madame Auguste Lemonier*, the shape of the flower being very good, but lacked brilliancy of colour. The other selected varieties were *Joseph Spae*, *Madame L. van Houtte*, *Jules van Loo*, *H. Toit*, *Madame Freeman*, *Madame Donner*, *Martha Reimers*, *Lindenii*, and *superbum*. Among the newest sorts are *Mrs. Harry Veitch*, *Baron Schroder*, *Madame Peeters* and *Mdlle. Alex. Hardy*; but these, though finer than early varieties, are poor compared with those we have described as the best. The collections of twelves and sixes were excellent, the most successful exhibitors being MM. Blanquaert and Vermeire, who showed several remarkable varieties, and admirably grown specimens. The finest *Clivea*, from a cultural standpoint, was a specimen of the *Lindenii* variety, from M. Vuyksteke, of Lochristy, which bore about a dozen huge spikes of brilliant flowers.

ANTHURIUMS.

Judging by the large numbers of the many new and beautiful varieties of these seen throughout the exhibition, they must be very popular on the Continent. The several varieties and hybrids of *A. Andreamum* and *A. Scherzerianum* made of themselves an exhibition. Seven classes were devoted to *Anthuriums* alone, and nearly all were represented. The principal exhibitors were M. Louis de Smet and M. L. de Smet-Duvivier, who, between them, took the 1st prizes. The chief class for an unlimited selection was best represented by M. L. Desmet, but the most varied were the smaller collections of twenty and twelve. The most noteworthy varieties in these were *A. Andreamum roseum*, with spathe of a delicate pale rose colour—very beautiful; *Andreamum carneum*, flesh coloured; *A. leodiense* ×, a cross between *A. Veitchii* and *A. Andreamum*, with longer and larger leaves than *A. ferrierense* ×. *A. Desmetianum*, with spathe of an intensely deep crimson, was the most remarkable of all, and one that we hope to see soon in London. The varieties of *A. Scherzerianum* were exceedingly numerous, but those that were absolutely distinct were few. The genuine large spathed *Wardii* was to be seen in large specimens, and the long spathed *longidorum* also; but the most striking varieties were the spotted hybrids, of which the variety *Rothschildianum* is the type. Numerous spotted forms have now been obtained, but though they differ from each other in minute particulars, they are a good deal alike.

M. de la Devansaye, a great amateur of *Anthuriums*, offered a valuable prize for seedling *Anthuriums*, and it was won by M. L. de Smet-Duvivier, with his hybrid named *Leopold II.*, in the way of *A. Andreamum*, but with a finer and differently

coloured spathe and distinct foliage. M. Devansaye himself showed examples of some extremely fine varieties of spotted spathed *Anthuriums*, some being very much finer both in size and colour than the original *Rothschildianum*.

They comprised eight varieties, which were prettily arranged in glasses, with Fern fronds to display them. *Marie Thérèse*, with a spathe 17 cm. in length, red, with delicate white mottlings; *La Fresne*, rose, with red spots—very pretty; *Dr. Masters*, a good new variety, white, with a few large splashes of red; *Devansayanum* is also a fine mottled variety; *Audegavense* is moderately spotted red on white. A double-spathed sort, named *Souvenir de Nice*, is stated to have the peculiarity of producing an extra spathe; it is constant. It is a mottled sort, red on white. Another similar variety, also double, is *Souvenir de Gand*. *Souvenir de Morren* shows a few whitish specks on a red ground.

BROMELIADS.

Belgium is the adopted home of Bromeliaceae, and, as might have been anticipated, many beautiful and distinct kinds were exhibited. We have yet to cultivate a taste for these plants. How it comes that plants which in addition to beauty either of flowers or foliage, possess also the excellent quality of standing rough treatment without suffering, have not found admirers among horticulturists in England, is difficult to explain. If some leading decorator would begin to use them there is little doubt but that in time we should appreciate them as much as the Belgians and French do; and here we cannot suppress our feeling of the loss of the historian of this order—the late Prof. Morren, who was wont to take so active part in these exhibitions.

For a collection of thirty kinds M. le Comte Paul de Hemptinne was 1st, with a beautiful lot; MM. Jacob-Makoy & Co. being 1st among the nurserymen, with a magnificent collection. Among the latter were splendid plants of *Caraguata Zahni* and *C. cardinalis*, both of them in flower, and having a heart of large cardinal bracts; *Vriesia hieroglyphica*, *Tillandsia fasciculata*, *V. Philippo-Coburghi*, *Alchmea Crousseana*, which is very near our *E. glomerata*; *Nidularia Marichali*, similar to *N. fulgens*, but much deeper in colour; and *Chevaliera Veitchii*, bearing a large richly-coloured head of flowers. A wonderful plant, named *Vriesia glazioviana*, carried off the 1st prize for a beautiful well-grown Bromeliad. It had very broad, semi-erect leaves of a vinous-purple colour. It belongs to the gigantic group, of which *V. regina* is the best-known example.

M. Louis van Houtte showed two plants of *Tillandsia Lindenii latispatha*, which were much admired. The scape is short, and covered with broad overlapping bracts, as in the variety called *vera*, but the bracts are broader, and the colour is pale salmon; the flowers, too, are larger and have more white in the centre than in the other forms of this beautiful Bromeliad. But the prince of the Bromeliads was a variety of *Vriesia hieroglyphica*, of which a single plant was shown under a large glass case. The beauty is in the variegation of the foliage, broad stripes or, in some leaves, one quarter of the width was wholly creamy-white, and the hieroglyphic-like transverse bands were of a soft vermilion. *Broechinia Andreamum*, shown by MM. Jacob-Makoy had leaves 3 feet long by 6 inches wide, deeply channelled at the base. It looks like the plant which Schomburgk describes as the nurse of *Utricularia Humboldtii*, which is found only in the water held in the sheathing bases of the leaves of the *Broechinia*. Plants of this are at Kew. *Nidularium Makoyanum* is a pretty plant, the leaves soft and shining, prettily striped with white. *Canistrum Leopardinum* is a large plant, the leaves semi-erect, green, with large irregular blotches of black-brown. These were shown by MM. Jacob-Makoy & Co., whose collection of Bromeliads is famous for its richness and attractiveness.

PALMS.

Among the plants exhibited none contribute more effectively to the beauty and grace of the exhibition as a whole than Palms. The Belgians, and, in fact, most Continental gardeners, cultivate these plants very largely, and the enormous examples of some of the most noble and rare kinds which they have sent to this exhibition are a proof of their devotion to the princes of vegetation. The cultivation of these plants is evidently much better understood in Belgium than with us. Magnificent specimens, furnished to the base with foliage, and perfect in

health, are grown in comparatively very small pots and tubs. This is one of the most astonishing features at the present exhibition, and one asks, how is it done? The Belgians say it is simply "Plenty of water, plenty of manure." Certainly we have something to learn from them in regard to the cultivation of Palms.

One of the most admired groups in the whole exhibition is one of grand specimens of Palms from M. Ghellinck de Walle. There are thirty plants, all very large and healthy, the finest perhaps being *Ceroxylon andicola*, with a sheaf of leaves 20 feet long—a magnificent plant; *Thrinax chuco*, called here *Trithrinax brasiliensis*, was also represented by a fine plant; *Livistona australis*, a splendid specimen, with a mass of leaves quite 12 feet through; *Thrinax excelsa* was shown under the name of *T. graminea*, both it and *T. argentea* being especially fine. *Pritchardia pacifica* was almost as large as the largest at Kew. *Livistonia Uoogendorpi* is scarcely known in England, but it is evidently a favourite with Belgian exhibitors, several very fine specimens being shown, that from M. Ghellinck being the best. It has purplish petioles clothed with long black spines, whilst the blade is divided almost to the base into broad segments.

An almost equally fine group was from M. Bernard Spae, also of Ghent. The most remarkable specimen was one of *Pritchardia macrocarpa*, which had six leaves, each 4 feet through, the blade spreading out flat, and the petiole very stout.

Washingtonia robusta is one of the very finest of Fan Palms. It was very well represented, both in M. Spae's collection and several others. The leaves are as large or larger than those of *Livistonia sinensis* and they are supported on stout petioles bearing large spines. This grand Palm will thrive in a cold house; there is a healthy example of it in the Temperate-house at Kew.

Cocos Bonnetti is another very handsome plant. It has the appearance of a *Syagrus*, the leaves being recurved and very glaucous. *Phoenix Andersoni* is very near *P. rupicola*, but not quite so soft and graceful; it is probably one of the seedlings raised in the Calcutta Botanic Gardens by Mr. Scott, some years ago.

M. D'Haene, of Genbrugge, sent some very fine specimens, one of *Caryota Rumphiana* towering above the rest, its massive leaves stretching 20 feet or more. This large specimen was in a round tub less than 3 feet in diameter.

Erythraea.—This genus was represented by two plants, one shown as *Brahea calcareata*, and also known as *B. Rozeii*, but which is the true *E. armata*, was most attractive. It is not unlike *Thrinax argentea* in habit, but the petioles are shorter and bear small marginal teeth, and the whole plant is glaucous, almost silvery. This Palm is another which may be grown in a cold house.

Cocos Yatai is similar to *C. Bonnetti*, but more graceful. It was represented by some very handsome specimens. Except at Kew we do not remember having seen this Palm anywhere in England. *Kentia rupicola* and *K. Mooreana* are two Belgian names for *K. (or Howea) Belmoreana*. Some very fine specimens of this were shown, the largest and handsomest by Madame la Comtesse de Kerchove. *Phoenix farinifera* was shown under the name of *P. Houlettii*; and a very handsome specimen *Caryota*, called *C. intermedia*, struck us as being very near *C. Blancoi* in general appearance; it is one of the most graceful of Palms. M. Vanden Abeele sent some splendid Palms, a handsome specimen of *Sabal Palmetto* being particularly striking. The groups of large Palms were all exceptionally fine, but we have only space for mentioning some of the most striking.

Included among the miscellaneous groups were excellent examples of *Licuala grandis*, the finest being shown by M. Van Houtte. The Belgians appear to have secured most of the plants of this beautiful Palm which were in England a few years ago, and whilst it is a very rare Palm with us, they have numerous handsome specimens of it.

Ravenia Hildebrandtii, also shown in splendid health by M. Van Houtte, as well as by other exhibitors, is one of the most distinct and beautiful of the Palms there. It is dwarf, graceful, with Fern-like leaves, almost as in *Cocos Weddelliana*; but the leaves are flatter and the pinnae broader. It is a Palm which in England ought to become popular.

Stevensonia grandifolia is shown in fine form by several exhibitors, and *Glaziova insignis*, which is a true *Cocos*, affined to *C. Weddelliana*, and not unlike the *Juan Fernandez Palm*, *Junania australis*, is also well represented. When young, this Palm is not attractive, but, like the ugly duckling, it develops

into a beautiful little specimen; as an exhibition plant it ought to rival *Cocos Weddelliana* with us.

Bismarckia nobilis is represented by small plants. At present it is more interesting than beautiful, and as it belongs to the gigantic *Borassus* set it is not likely to become very popular. It is a *Corypha*-like Palm, with short stiff petioles, the whole plant being glaucous-green.

Among small Palms there are many such as are used to some extent for decorative work with us, but few that were new. *Calamus australis* is a small species, remarkable for the form of its pinnae, which are broadest at the apex, and the central one much the broadest. It is quite distinct from any other *Calamus* in gardens, and is very near *C. Cunninghamii*. It was exhibited by M. Pynaert van Geert among a group of ten new Palms, which also included a distinct *Wallichia*, at present unnamed; *Korthalsia robusta*, *Corypha decora*, *Calamus trinervis*, &c. This was the 1st prize collection.

CYCADS.

As with Palms, so it is with Cycads in Belgium; they occupy a foremost position among popular plants. The number of grand specimens at this exhibition is remarkable, and without a single exception, they are perfect examples of culture. The variety, too, is equally striking, and, we regret to say, so also is the nomenclature. In England we have our own names for Cycads, the Belgians have theirs, the Germans theirs, and there is much confusion in consequence. If some one authority could be recognised everywhere we should then in time get uniformity in names for these plants. The same may be said of all plants. At present, whilst Englishmen are busy revising, remodelling, renaming, the Continental botanists are doing likewise, and we have two or more sets of new names to swallow. Here we shall place the English names first and bracket those which are used at this exhibition.

For the most beautiful lot of fifteen Cycads the 1st prize was awarded to M. de Ghellinck de Walle for some magnificent examples of careful culture, and the 2nd prize was taken by the brothers De Smet with very fine plants. M. de Ghellinck was also 1st for eight Cycads. Other exhibitors of Cycads were M. B. van Milgham, M. L. Spaë, and others.

Macrozamia spiralis (M. Mackenzii).—A plant of this, bearing four fine cones, is a great attraction. The cones are about 5 inches by 2½, deep green, and are on stalks 4 inches long. *Enecephalartos Frederici Gulielmi*, called in one group *Zamia Van Geerti*, was shown in magnificent condition, as also was *E. brachyphyllus* (*Zamia cycadiifolia*); these had leaves 3 feet long, and good stems. *E. Altensteinii* and *E. longifolius*, which are very closely related, were represented by very fine plants, under the names of *Zamia Vanden Hulst*, *Z. Katzeri*, and *Vroomii*. *E. villosus* was very well shown, one plant having a magnificent head of leaves, each one 10 feet long; *E. horridus* and *E. Lehmanni* were very conspicuous in their coats of silvery-green.

Some good plants of Cycas are shown, amongst them being splendid pieces of *C. siamensis*, with Onion-shaped stems and beautiful heads of foliage. This Cycas is certainly one of the most valuable of all in a decorative sense. A strong plant of it was shown in one group as *C. spicus*. A tall thin-stemmed specimen, without a name, looked remarkably like *C. Ruminiana*, an exceedingly rare plant. Of course *C. revoluta* was well represented; this species is grown by the florists for use in wreath-making, especially funeral wreaths, the fronds being arranged in a kind of circular plume, and the flowers placed at the base of the plume.

No true *Zamia* nor *Bowenia* nor *Stangeria* was shown—a curious circumstance at an exhibition in Belgium.

TREE FERNS.

There are some grand Tree Ferns shown, so tall and mighty that one must admire the enthusiasm of the exhibitors who bring them. The Brothers De Smet were 1st, with eight monsters, amongst them being *Cyathea medullaris*, with a stem 20 feet high, carrying a fine head of fronds; two *Hemitelia Smithii*, with 12 feet stems; *Dicksonia antarctica*, 12 feet stem; and *Cyathea dealbata*, 10 feet stem. The 2nd prize was awarded to M. E. Vervaeke & Co., for very fine plants, among which were *Dicksonia fibrosa*, with a stem 15 feet high, and 1½ foot in diameter at the base. *Cyathea Cunninghamii*, stem 21 feet high, and 9 inches at base; and *Dicksonia squarrosa*, 10 feet high. These all carried fine heads. The same firm showed a magnificent *Cyathea dealbata*, with a stem 20 feet high, which,

however, was placed 3rd to a very fine *Dicksonia antarctica*, exhibited by M. Ad. D'Haene, and a *Cyathea dealbata*, from M. de Ghellinck de Walle. These giants are established in tubs which are very little more in diameter than the base of the stems they contain, and although this results in the fronds being less in dimensions than when a liberal allowance of root-room is afforded, still the heads of fronds were as a rule all that one need desire.

M. de Ghellinck de Walle was the only exhibitor in the class for thirty tropical Ferns, and he was awarded the 1st prize for a collection which, though made up of small plants, were well grown and interesting.

M. Auguste van Geert showed a handsome *Lomaria platyptera*, for which he obtained the 1st prize, as a beautiful and well grown Fern; a large example of *Gymnogramme Lauchiana gigantea* being 2nd. The same exhibitor was 1st for three new Ferns, showing *Pteris Mayi*, *Adiantum reginae*, and *Nephrolepis rufescens tripinnatifida*. M. Pynaert van Geert was 2nd with *Gymnogramma elegantissima* (our *G. schizophylla*), *Pteris cretica grandiceps*, a pretty and well crested form, and *Adiantum reginae*.

For thirty hardy Ferns M. Louis van Houtte took the 1st prize, with a clean and well grown lot; he was the only exhibitor in this class.

BELUS, &c.

Bulbous plants are much below the English standard in all cases, except as regards *Clivia*, which may be conveniently treated under this section. Hyacinths were of fair quality, and the varieties such as we see at the London shows. The leading exhibitors are Messrs. Byvoet frères, Haarlem, who took 1st for both 150 and 100 varieties. Tulips are poor, but the varieties were very numerous from the same exhibitor. This poverty is probably owing to the long duration of cold weather, which would naturally retard development. Lilies of the Valley are rather drawn, and the flowers small. Prizes were offered for Narcissi, but no competitors appeared—a circumstance which would hardly occur at the exhibitions of any English society at the present time. The *Amaryllis* received due attention, but the Belgians are a long way behind as regards these plants.

Messrs. James Veitch & Sons, Chelsea, London, show a splendid collection (not for competition), mostly of new varieties. Of the many new sorts shown the following is a selection of the best examples:—*Tityrus*, brick-red, green base; *Dante*, brick-red, white nerve, pale lower segments; *Etna*, deep brick-red, excellent in form; *Malvolio*, scarlet, crimson base; *Gigantea*, deep red-scarlet, dark base—very large; *Adela*, white, lightly flaked with red; *Perfection*, bright red, with white nerves—very attractive; *Fair Maid of Perth*, white red, paler lower segments. This group, which created a deal of admiration, which certainly was deserved, as the flowers were well formed, large, and richly coloured. For this was awarded a double extra prize, consisting of a 200 franc Gold Medal and a piece of plate offered by Madame Verschaefelt.

M. L. van Houtte shows a good collection of twelve Liliiums, and took a 1st prize. They were well-grown samples throughout—*Browni*, *canadense*, *longiflorum* vars., *umbellatum*, *bicolor*, &c., were very good specimens.

Cyclamens are well represented by M. A. Dalliëre, Ghent, whose plants received a Gold Medal; and a similar award was made to B. S. Williams, London, for his group, sent not for competition. His flowers were excellent specimens of culture and selection.

Gloxinias, usually a weak feature at these shows, are, on this occasion, well shown by M. Delaruyé-Cardon, who took the premier place for thirty plants.

Clivias are abundantly shown by various exhibitors, and throughout the quality was excellent, as is usual at the Ghent show. The firm of Messrs. P. Blancquaert & Co., Vermeire, showed extremely well, securing 1st for new varieties, and also in two other sections. M. Ghellinck de Walle led well in the amateur's class, showing strong specimens bearing large heads of bloom. M. B. Spaë led in the chief open class (for sixty), showing very well indeed—*miniata splendens*, *Lindeni*, *Madame J. Hye* were good varieties. Messrs. Boelens Bros. came in as a close 2nd. M. Ch. Vuylsteke had a grand plant of *C. Lindeni*, for which he took a Silver-gilt Medal.

AZALEAS.

Azaleas of the *indica* section, and also, as was only proper, of that section which has received the name of this town, viz., Ghent, are shown in great

abundance. The varieties of *indica* are magnificent in all respects; the plants in some cases measure as much as 4 or 5 feet in diameter, and were simply masses of bloom; the groups, which occupy the centre of the great hall, contain the leading specimens, and to the general public these balls of flower probably constituted the chief, or at all events, one of the chief features of the whole show. The Louis van Houtte Memorial Prize (English) was offered for a collection of the best varieties introduced since 1880. M. Joseph Vervaeke, of Ghent, is the successful competitor, with wonderfully good plants, comprising sixty-eight varieties, all equally well flowered; M. L. van Houtte, of Ghent, was a good 2nd, with a smaller collection.

Forty specimen plants are best from M. de Ghellinck de Walle, who therefore carried off the prize offered by the Federation of the Belgian Horticultural Societies. The Comtesse de Kerchove, Ghent, was awarded the 2nd place. M. Vuylsteke also showed well.

Of all the plants shown the following varieties were good:—*Alexander II.* (white), *La Victoire* (bright crimson), *Mdlle. Leonie van Houtte* (white, green spots), *Roi des Blancs* (pure white, fine var.), and *Bijou de Paris*, *Comtesse de Flandres* (rose), *Duc de Nassau* (cerise).

M. Ch. Vuylsteke contributes a pretty hybrid *Azalea* from *A. amœna*, called *Forsteriana*×; it is of a bright red colour, and has a petaloid calyx, like *amœna*; the flower is about the same size as in *A. amœna*, or perhaps a trifle larger—very decorative; a double form of double *Azalea mollis*, of a terra-cotta colour, named *Perfection*; he also had a large group of *A. mollis* of great worth, justly receiving a 1st prize for the exhibit. The plants were extremely well flowered and capitally coloured. *C. F. Lappies* (pale red), and *W. E. Gumbleton* (pale sulphur) were conspicuous. *Azalea pontica* varieties were also best from the same exhibitor, and M. L. van Houtte was a good 2nd, both exhibitors having similar varieties, of which the best may be named as *Roi des Belges*, *Fama*, *Gloria Mundi*, and *Unique*. These exhibitors secured most of the leading prizes for *Azaleas* of all sections, but other prizetakers included Messrs. Vervaeke, De Schryver, De Meyer, Miëghen, and M. E. Vercarriëren, of Melle, the last of whom was successful in securing the 1st place for sixty *indica* varieties (market plants), offered by Messrs. De Smet fils, as a memorial of the late M. L. de Smet; M. P. de Baerdemaeker was 2nd, both lots being very freely flowered plants. These smaller plants of *Azalea indica* varieties are also first-rate in quality, and, with the *Rhododendrons*, form the leading features in the large annex.

Several novelties are shown, but space forbids our further mention of them. Of the varieties of recent introduction there were several plants, but we can only call attention to the leading sorts. *Vervaeiana*, from M. J. Vervaeke, Ghent, is a very pretty flower; it is pink, with a pure white margin with rose spots, double; and from the same exhibitor *Perfection de Gand*, a brilliant carmine, single. M. de Kneff had *President Oswald de Kerchove*, after the same style as *Vervaeiana*, but more deeply coloured, double; *Madame Raph. de Smet*, also from M. de Kneff, may be described as a single form of the other. M. Louis van Houtte had *J. T. D. Llewelyn*, rosy-pink with a white margin, double. These varieties were also shown in other lots.

While speaking of *Azaleas* we may say incidentally, for the benefit of planters, that we were informed that *A. mollis* is not touched by rabbits and deer, which acts will add to the value of this plant.

RHODODENDRONS.

Of *Rhododendrons* there are many capital collections; but, notwithstanding the general excellence of the exhibits, the English growers are able to show plants of even greater merit. M. Alexis Dalliëre, who is an exhibitor in many classes, contributes the grandest collection of *Rhododendrons*, the plants being chiefly conspicuous for the large size of their trusses, *Mdlle. Marie van Houtte* and *Cytha* at once attracting the attention of the beholder: he won the 2nd prize in the leading class for fifty—the exhibit made by M. Bauman, also of Ghent, being the most honoured. *John Waterer*, *Madame Pasteur* (*lilac*), *Evelyn* (white, green spots), are good varieties here. M. Pynaert van Geert, Ghent, contributed a grand collection, all good specimens of varieties which are popular with us at home, and took 3rd; but mention may be made of a striking variety, of a bright rosy-crimson colour, shown in this collection, and named *Sir R. Peel*.

M. B. Fortie shows a good lot in the thirty class for nurserymen, the chief prize offered for amateurs being awarded to M. A. Vermeersch Hebbelynck, Ghent, whose exhibit was highly creditable. Himalayan and Java Rhododendrons were represented by a few groups, but nothing of a very striking nature is shown. M. Pynaert van Geert shows the best. Messrs. Spae, D'Hane, De Smet, Cuvelier, Banman, and Vervaeue all have a good display. The large annexe was very gay with these plants, and in all cases competition was very close. New hybrids and seedlings did not include anything of particular merit.

MISCELLANEOUS.

The Van Houtte Memorial Committee offered a prize for twenty-five hardy trees and shrubs forced into flower. This was won by M. Van Driessche-Lys, who shows a most deserving group of plants in pots. There are in the group specimens of Magnolia and Ribes, Coronilla emerus, very well done. M. L. van Houtte is 2nd, also showing a good group, in which Spiraeas and Hydrangeas were well represented; also a trained plant of Forsythia viridissima, the stems being brought together and encased in clay on which cress was sown. The appearance presented is that of an expanded umbrella—a cultural trick for the amusement of the populace. A good specimen of Wistaria sinensis and various Ribes, &c., is also shown.

From M. J. de Costa there came good Kalmias and Andromedas, he leading in these classes; and he also showed, what is not seen at English exhibitions—twelve pots of Epimedium violaceum; but no prize was awarded here, the specimen not being very well flowered. Specimen Acacias from him are good, and he also had a good couple of Aspidistra, although M. Fortie showed better plants, and consequently led. Fruited Orange trees (Chinese) in pots, small plants about a foot or 18 inches in height, form a pretty feature. M. Pierre Gulnick showing the finest, laden with fruits. Of the large specimen Orange trees, those of M. Schatsaert-Brasseur are splendid; the heads were beautifully even, and the plants in excellent condition. Large plants of Cytisus racemosus are exhibited in a close competition, and very beautiful objects they were too. M. L. Vervaeue and M. A. Cornelis being respectively 1st and 2nd.

Cinerarias were poor, like all the other florists' varieties, although Messrs. Vilmorin, Andrieu & Co., Paris, made a good exhibit of these plants, not for competition. The colours of their plants were very bright, and an extra prize of a Gold Medal was awarded to them. In the competition M. Sarnont de Volksberghe shows best among the amateurs, and M. E. van Driessche-Lys occupies the same place in the nurserymen's section.

Around Messrs. H. Cannell & Sons' (Swanley, Kent) exhibit of specimens of their strain of double Cinerarias there was always a throng of admirers, and the cut flowers of the singles far surpassed anything else shown elsewhere. Some cut flowers of Carnation Pride of Penhurst, and fine trusses of zonal Pelargoniums were also shown. A Large Silver Medal was given in recognition.

Roses are generally greatly below our standard, except from Messrs. Wychaert freres, who showed fairly well. *Diclytra spectabilis* is good from M. F. Mierschaert, gr. to M. Cannart, Melle, and *Deutzia gracilis* from M. E. Decock, Ghent, were fine.

Mignonette shown by M. A. Snoeck, of Ghent, is remarkably vigorous and strong, the foliage large and flat.

Camellias are very fine from M. Louis Eekhaute, who shows thirty excellently flowered specimens of well known popular varieties, such as *Mathotiana fimbriata reticulata*, &c. MM. I. & L. Wychaert and M. J. Vervaeue also contribute creditable examples.

Not for competition, M. Van Houtte sends a varied and extensive collection of shrubs of recent introduction; this is a very pretty exhibit, and comprised such plants as *Sambucus racemosa plumosa*, with the pinnæ lacinated, and the entire plant very graceful; *Tilia platyphyllo foliis medio pictis*, a prettily variegated pendulous Lime; *Sambucus nigra pendula*; a variegated form of the Tulip tree; *Ulmus campestris plumosa*, &c., and a few Maples; but the finest varieties of these latter are shown by the same exhibitor in a separate collection of special merit. All are forms of the Japanese Maple, and numbered twenty. It would be impossible to say which are the best, as the extreme gracefulness of the variously coloured and finely divided leaves are in all cases most attractive. Messrs. Jacob-Makroy & Co. show a well grown plant of *Arucaria ele-*

gans about 5 feet in height, and from Messrs. Spae comes a tree of *A. excelsa* glauca.

A large exhibit is that entered as a compliment, from the members of the Floral Society of Antwerp and which is composed of a quantity of stove and greenhouse plants from various gentlemen, each plant bearing a ticket with the proprietor's name. This comprised about one hundred varieties and species, which we are quite unable to particularise.

Large specimen Bays in pots are truly magnificent from both M. T. Buysse and M. Schryver, the trees being very large and furnished with solid even heads. Mr. Pynaert van Geert had Hollies in specimens.

Messrs. Van Geert, M. P. de Schryver, and J. Vervaeue had each good specimens of Aucubas, the fruiting plants of the two latter being very good specimens.

Bouquets, wreaths, epergnes, boxes for windows, and baskets for indoor decoration, were fairly numerous but the only thing calling for special mention is that Mr. W. Brown of Richmond, Surrey, took the Gold Medal for six various bouquets and for table decoration.

BOILERS, &c.

There are a considerable number of these, but the majority are much like our English forms, and we found nothing specially to be recommended to our English friends. The best one we noticed was a form of terminal-end saddle, exhibited by M. Ed. Mahn, Ghent, which has a waterway back to the fire, about 8 feet from the end; the flame has to pass over this, and under the end waterway to the chimney. The heating-power is also much increased by five 2-inch tubes under the arch, which are secured into the front and back waterways. Charles de la Croix, Ghent, shows a number of saddle boilers with horizontal "Galloway" tubes in the firebox, but these boilers are much too deep from the bars to crown of arch, one measuring nearly 3 feet. A saddle should not exceed 21 or 24 inches in depth. J. Vanderputte-Stevens, Ghent, exhibit a horizontal tubular somewhat like Ladd's, but the pipes form a continuous coil. As this boiler was 7 feet long, and under 250 feet of 3-inch pipe to heat, there was no opportunity of judging of its power; but, on the whole, we did not think it equal to the English forms. We saw a boiler made in this way by the late Mr. Speed at Chatsworth, some years ago.

Bentnick freres, Ghent, exhibit several sizes of an upright boiler, made on the principle of a locomotive boiler; the fuel is fed at the top, and there is a large magazine, so that it will burn some time without attention. This central magazine is surrounded with 2-inch tubes passing through the waterway, and connected with two chimneys—why two we could not discover. The greatest defect we noticed was, that the flow-pipe left the boiler about 1 inch below the top, thus leaving a space of steam and air—one of the greatest checks to circulation a boiler can have. Kerner Deguevera shows a variety of rivetted saddle-boilers, much like ours, but having only a 1-inch waterway. These may answer with good water, but with impure water would soon be furred up. In conclusion, we may say that the exhibit, both of boilers and greenhouses, was neither so extensive nor so good as in 1883.

In the matter of greenhouses and other structures the Belgians would do well to learn from the English on many points. In one of the houses, however, there was a good style of staging, consisting of square porous earthenware tiles, freely perforated and resting on iron stays.

Messrs. Dutry-Colson, of Ghent, opened their extensive new premises on Sunday for the sale of horticultural requisites and agricultural machinery, and invited the inspection of the horticulturists. The firm was established in 1812, and has now grown to be the first in this business in Belgium. The shop covers 1500 square yards. It has a very handsome façade to the Rue des Champs. Below the street level is a large basement for storing the heaviest descriptions of ironmongery, mowing machines, garden stools, and, in fact, every horticultural requisite is there to be found, selected with judgment from the best makers.

Obituary.

JOHN WOODBRIDGE. The intelligence of the death of Mr. John Woodbridge, head gardener, agent, and steward to the Duke of Northumberland, Syon House, Brentford, on the 16th inst., at the

age of fifty-six, has been received with universal regret, not only by the horticultural community, but also by a large circle of personal friends resident in the district, and his unlooked-for decease is all the more regrettable because he had recently been selected to represent the practical gardening community upon the Council of the reorganised Royal Horticultural Society. This important post was accepted by Mr. Woodbridge with sincere diffidence, for he was one of the most unobtrusive and unassuming of men, and with a due sense of the responsibility he was undertaking. That this feeling dominated in his mind was shown during the hours of delirium which immediately preceded his death—he alluded to resolutions he had to propose at Council meetings, and to weighty matters impressed on his mind as necessary to the well-being of the Society. He gradually sank to a semi-unconscious state, and died about 10 A.M. on April 13. He leaves a widow and one son, thirteen years of age. Our friend was laid to rest in Isleworth Cemetery on Thursday, the 18th, his grave surrounded by a large circle of mourning friends: Mr. A. F. Barron, Chiswick, attending on behalf of the Council of the Royal Horticultural Society.

Mr. Woodbridge was a native of Amersham in Buckinghamshire, and was born upon the estate of the late T. T. Drake, Esq. He entered upon his career as a gardener in the Rectory Gardens, and leaving there proceeded to the Marquis of Londonderry's, at Fulham; and from thence to the gardens of Lord Chelsea, situated on Putney Heath; then to Latimer, Bucks, the residence of the Hon. C. C. Cavendish; and next to Lord Boston's seat at Hedsor, Maidenhead. In 1848 young Woodbridge was sent by Mr. Davis, then in charge of the Hedsor Gardens, to one of the great exhibitions of the Royal Horticultural Society at Chiswick with two Pines of large size, and his most sanguine aspirations of that day could not possibly have been in the direction of a seat on the Council of the Society to which he was appointed just forty years afterwards.

On leaving Hedsor he went to Gunnersbury Park, and served for a time under the late Mr. W. Forsyth. Then he was transferred to Syon, where he remained for four years. Then he engaged himself to Mr. Forest, to assist in laying-out the Surrey Gardens, at Walworth, wherein was erected a spacious music hall, in which M. Julien gave promenade concerts, and the Rev. C. H. Spurgeon preached prior to the erection of his Tabernacle in Newington Causeway. This business done, and his health failing him, he went to the West of England, and entered the nurseries of Messrs. Garraway, Mayes & Co., at Durdham Downs, Bristol. Then he took charge of the gardens of W. Tothill, Esq., at Stoke Bishop, near Bristol, and while there made his mark as a highly successful cultivator of Orchids, stove and greenhouse plants, fruit, &c., taking high honours at the exhibition held at Clifton. From here he went to Kiddington Hall, Oxfordshire, the residence of H. L. Gaskell Esq., and had charge of the gardens for the space of four years. Next he came to the Royal Gardens, Kew, as one of the foremen of departments, taking in hand Orchids, Heaths, &c., until July 1870, when, on the recommendation of Mr. John Smith, he took charge of the gardens at Syon; and in 1882 he had in addition the appointment of steward and agent of the estate. While he had to witness changes in the subjects cultivated at Syon, in all matters he exhibited high skill, and reaped well-deserved success. About 1853 he succeeded in first fruiting the Vanilla [in this country] and Mangosteem, and contributed to the horticultural journals some interesting details respecting his achievement. He was an occasional contributor also on other matters, always writing in a weighty and thoroughly practical manner.

Mr. Woodbridge was called to fill many offices of trust in connection with gardening. For the period of sixteen years he was almost continuously a member of the Fruit and Floral Committees of the Royal Horticultural Society, and at the time of his death had a seat on the Fruit Committee. He was an

active member of the committees of the Apple and Pear Congresses. He was a valuable promoter of the series of International Potato Exhibitions held at the Alexandra and Crystal Palaces. He was a member of the committee of the Gardeners' Orphan Fund, and he was a zealous promoter of this important movement. As a judge at horticultural exhibitions his services were much in request, for he not only possessed great practical experience, but rare judicial capacity also.

THOMAS CRIPPS.—We regret to have to record the death, on Tuesday, the 17th inst., of Mr. Thomas Cripps, of the well-known firm of Cripps & Son, nurserymen, Tunbridge Wells, in his 79th year. The deceased, who was highly respected by all who knew him, started in business nearly sixty years ago, and had developed his nursery into one of the largest of the kind in the kingdom. For several winters Mr. Cripps had been obliged, through a bronchial affection, to stay indoors during bad weather, but this did not impair his zeal for business. Many new varieties of plants were originated in this nursery, and some of our readers will remember that it was from this nursery that the first white Fuchsia (*Venus Victrix*) was sent out nearly fifty years ago; and of late years the Clematis has been very successfully handled, and many new varieties raised. The deceased was a kind-hearted man, and many a gardener can bear testimony to his kindness in times of adversity, and many a young gardener obtained at the Tunbridge Wells nursery his start in life. The funeral is to take place at the new cemetery, Tunbridge Wells, on Saturday, April 21.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending, April 16, is furnished from the Meteorological Office:—

"The weather continued cold with some falls of rain, sleet, or snow, during the earlier days of the period, but subsequently became mild and seasonable, warm showers alternating with bright intervals of sunshine.

"The temperature remained very low until the 12th, when it rose rapidly and became high for the time of year. The average for the week has consequently been rather above the normal in Ireland, as well as in the east of Scotland, and at most stations in the west of Scotland and north of England, but elsewhere a deficit is still shown. The highest of the maxima, which were registered either on the 14th or 15th, varied from 57° in 'Scotland, N.' to 63° in the 'Midland Counties,' and 'England, S.,' and to 66° in 'England.' The lowest of the minima were recorded on the 10th, when the thermometer fell to between 28° and 31° in the 'Wheat-producing' districts, and to between 29° and 35° in the 'grazing' districts. In the Channel Islands the lowest reading was 39°.

"The rainfall has been more than the mean in the north and west of Scotland, but in other parts of our islands it has not diffused much from the normal value.

"Bright sunshine has been rather deficient except in the north-eastern and eastern parts of the kingdom. The percentage of the possible amount of duration ranged from 17 in 'Scotland, N.,' and 19 in 'England, S.W.,' to 36° in 'England, N.E.,' 37 in 'England, E.,' and 38 in 'Scotland, E.'"

NOTICES TO CORRESPONDENTS.

** Owing to the space occupied by the Ghent Show Report, much matter is held over till next week.

APPLE: *R. P.* Unknown; not of any merit.

BORONIA MEGASTIGMA: *P. L.* This plant may be grown in the mixed greenhouse, but it is much better when placed along with the other New Holland and hardwood plants in a pit or house. Cut back slightly after flowering; give a month's rest in a cooler house than that in which the plant flowered, and repot when top growth has begun.

Shifts into fresh pots should be very slight ones at a time, and should not take place later than the middle of July, or the new growth will not get matured. Half plunging the plants in a bed of fine gravel in a frame facing south is a good way to grow this and other *Boronias* during June, July, and August. Use the best of hard peat and silver-sand, and crock the pots well, but do not half fill them with drainage materials.

CORRECTION.—In report of the Royal Horticultural Society, last week, p. 470, col. c, *Miltonia vexillaria* Emperor Frederick, for Mr. Catt read Mr. Cooper.

INSECTS ON TOMATO PLANTS: *E. P.* Shake them off at night on to white cloths, and destroy; shovel away the surface soil and burn it. The insect is one of the destructive family of weevils.

MARBLE VASES: *Constant Reader.* Vases of Italian marble, when filled with soil for plant-growing, are liable to get discoloured, and to harbour moss on the surface. It is always better, in planting such vases, to employ a broad pot or pan to hold the soil, and then, provided the egress of water is sufficient, no harm will be done.

NAMES OF PLANTS: *W. G.* 1, next week; 2, *Coleonema album*; 3, *Arum* sp.—next week; 4, *Scilla Sibirica*; 5, *Acanthophippium sylhetense*; 6, *Dendrobium pulchellum*.—*F. G. T.* *Bletia hyacinthina*; *Dendrobium Wardianum* malformed.—*W. M.* *Lycaste Harrisoni*; *Dendrobium chrysoxanthum*.—*T. P.* *Streptosolen Jamesonii*: it is also called *Browallia Jamesonii*.

NECTARINES: *Enquirer.* The fruits do not swell because the stone has reached its final stage of growth, when that is over, the maturing of the fruit should take place. The splitting of the stone may be due to too much moisture at the root arising from insufficient drainage.

PERENNIAL CLIMBING PLANTS FOR AN ARCH: *Trellis.* The following may be used in the position named:—*Begonia radicans*, *Periploca græca*, *Clematis flammula*, and any of the many varieties of the Clematis; *Aristolochia Sipho*, *Virginian Creeper*, *Roses Climbing Devoniansis*, *Madame Desprez*, *Fellenberg Noisette*, *Rosa Polyantha*, and *Honeysuckles* in variety.

POTATO PLANTING: *E. Jones.* On rich soils, and in seasons when the Potato disease is not prevalent, planting in rows from 2 to 3 feet asunder, and about half that distance apart between the sets in the rows, may answer very well; but in moist seasons, when the disease is usually too common, Potatoes planted at wider distances, each plant having a circular mound to itself when earthed up, escape the disease better so far as the tubers are concerned; as, owing to the branches of the plants lopping over on to the ample surrounding soil, in which no tubers lie buried, the latter escape infection by the falling spores to a very large extent. On soils of poor quality thick planting is very objectionable for obvious reasons.

ROYAL HORTICULTURAL SOCIETY: *T. P.* Apply to the Secretary, 111, Victoria Street, S.W., for the rules, &c.

STRAWBERRIES: *P. C.* The abortive berries may be due to want of ventilation, or to the plants being suddenly put into great heat and a moisture-laden air. We do not suppose the hard water you use in a tepid state would cause the malady.

STRAWBERRY: *J. M.* Sir C. Napier.

VIOLET VICTORIA: *J. C.* The seedling sent is one of the finest dark double flowers that we have seen; footstalk sufficiently long, and the fragrance delicious.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

DIED, recently, Mr. GROSVENOR, of The Nurseries, Wetley Rocks, Stoke-on-Trent.

Write for Dr. Voelcker's Report, Pamphlet, Testimonials, and Instructions how to apply

JENSEN'S

Every grain fertilizes because the Guano is perfectly pure. It is most economical, one part of Manure to 100 parts of soil being ample for garden use.

FISH-POTASH

FISH-POTASH contains Ammonia, Phosphates and Potash in large proportions, which are the principal elements of fertilization.

GUANO.

GUANO—2-lb. Tins, 1s.; in Bags, 7 lbs., 2s.; 14 lbs., 4s.; 28 lbs., 6s. 6d.; 56 lbs., 10s. 6d.; 1 cwt., 16s.; 2 cwt., 30s. Special terms for larger quantities. Analysis guaranteed.

J. JENSEN & CO. LIMITED.
109, Fenchurch Street, London, E.C.

To Market Gardeners, &c.

To Grow fine Vegetables and Flowers, Gardeners should use **SULPHATE OF AMMONIA**. One trial will prove the great value of this Manure, and ensure its constant use hereafter. It can be applied either separately or mixed with ordinary stable or farmyard manure. Rose Trees and Garden Plants are much benefited by being watered with a weak solution once or twice a week. Instructions on application, post-free. Price free on rail at Sheffield, 13s. per cwt., or 7s. per 56 lb. P.O. Orders payable to The MANAGER, Sheffield Gas Company, Sheffield.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used STANDEN'S MANURE for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—*C. M. HOVEY, Boston, U.S.A., May 27, 1887.*"

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in KEGS, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

TWO SPLENDID NEW CYPRIPEDIUMS FROM NEW GUINEA.

CYPRIPEDIUM ROTHSCHILDIANUM, RCHB. F.

(Syn. CYPRIPEDIUM NEO-GUINEENSE, LIND.)

See full description of this surprising plant in last issue of *Gardeners' Chronicle*, page 457, but with the remark that this astonishing introduction is not due to the "indefatigable zeal of Mr. F. Sander," but to that of Mr. J. Linden, who introduced it first from New Guinea in May, 1887, and flowered it in January, 1888.

Good Established Plants, 4 to 5 leaves, 63s. each; 3 Plants, 168s. Stronger Plants, 105s. and 147s. each.

CYPRIPEDIUM PRÆSTANS, RCHB. F.

One of the finest Cypripediums, also introduced from New Guinea by Mr. J. Linden in 1886, and splendidly figured in *Lindenia*.

Good Established Plants, 4 leaves, 63s. each. Stronger Plants, 105s. and 147s. each.

Apply to **L'HORTICULTURE INTERNATIONALE, PARC LEOPOLD, BRUSSELS, BELGIUM.**

BOULTON & PAUL, HORTICULTURAL BUILDERS, NORWICH.

No. 73.—GARDEN FRAME.

Sides of Frames 14 inches high, 2 feet 3 inches at ridge, easily put together. This Frame has given general satisfaction, and was brought out by us in 1883.

	Length.	Width.	Price.
1	Light Frame, 4 feet by 6 feet	...	£3 17 6
2	" " 8 feet by 6 feet	...	4 7 6
3	" " 12 feet by 6 feet	...	5 17 6

THE "NEW EASY" LAWN MOWER.

Has an Open Steel Roller.

A man can work a 24-inch machine, cutting Grass 5 inches high clean to roots.

There is no easier working, no better finished, no stronger, no more durable mower in the market.

The Front Roller, with simple adjustment, enables the machine to cut very close to the ground, and to do fine work.

The machine will also cut verges.

RUSHTON'S PATENT FOUNTAIN WORKS, HULLING, YORKSHIRE

ARTISTIC DESIGNS IN ELECTROPLATE

The Rev. H. W. Young, writes:—"The Rectory, Stewartstown, Co. Tyrone, February 20.—The Fountain is a perfect little Gem, and gives the most entire satisfaction."

These Fountains are now sent all over the world. Every lover of the beautiful should send for Mr. Rushton's coloured Illustrations, Testimonials, and Price LISTS, post-free. Please name this Paper.

SANKEY AND SON'S GARDEN POTS.

From Messrs. MARSHALL BROS. AND CO., Barnham and Brighton, Agents for our Pots for Brighton and district.
 "GENTLEMEN.—The last consignment of 16,000 pots to hand to very good condition. We like your pots very much; they are light, and very durable, and we save fully £50 per annum by using them instead of our local pots."
 From Messrs. ARMITAGE AND SON, Nurserymen, Huddersfield.
 "We have used for over twenty years, and are still using and selling, only Sankey's Nottingham-made Garden Pots."

"BULWELL POTTERIES," NOTTINGHAM.

Carriage and Breakage Free on £10 Orders. Half Carriage and Breakage Free on £5 Orders.
 Samples (carriage free) gratis, prices free on application.

From Messrs. HARLEY AND SONS, Dunlee and Perth, N.B.
 "We are very pleased with quality of your pots, we grow large quantities of plants for market, and find nice-looking pots make the plants look and sell better; yours are not only superior to others in colour and shape, but are not half the weight, yet stronger, neither do they turn green."
 From Messrs. WALSHAW AND SON, The Nurseries, Scarborough.
 "The pots are so superior over all others we have used that we shall have great pleasure in placing our orders exclusively with you."

GROMPTON & FAWKES, HORTICULTURAL BUILDERS, CHELMSFORD.

NEW BOOK of Photo-Lithographed Sketches of Winter Gardens, Ranges of Ho-houses, Vineries, Architectural Conservatories, &c., of various Designs and Sizes, recently constructed, erected, fitted, and heated complete by us in different parts of the country; with particulars of the most successful Hot-water Heating Apparatus of the century. Post-free on application.

WANTED, a thoroughly experienced young MAN, as Furnisher and Gardener. Also a YOUTH, about 18, accustomed to Gardening. Must have good references.—Apply, before 11 or after 7 o'clock, 60, George Street, Portman Square, W.

WANTED, a First-class Man as ORCHID GROWER, and to take full charge of good Collection. First-class character requisite.—Apply, by letter only, to R., 18, Thayer Street, Manchester Square, W.

WANTED, a JOURNEYMAN for Houses, and Assist Outside, Pruning and Bedding Out. Wages 16s. per week, both, &c.—Apply by letter, stating age and experience, I. W. CORNFORD, Quex Park, Birehington, Kent.

WANTED, TWO Young MEN (about 20 years of age). Must have had experience in Growing Plants and Cut Flowers for Market.—Apply in own handwriting, to ROBERT FEATHERSTONE, St. Ann's Nursery, Kirkstall, Leeds.

WANTED, a Young MAN, for the Grape and Tomato houses, and willing to make himself useful.—State age, experience, and wages expected, to W. HAZELL, Mill Road, Heene, Worthing.

WANTED, AT ONCE, a strong, active, respectable young MAN, to work in Small Nursery, and do Jobbing Work. Wages, 21s. Also a strong active LAD, about 17.—J. Y. FRASER, Florist, Brackenbury Road, Hammersmith, W.

WANTED, a young MAN, quick at Potting and Tying.—Apply stating wages to ARTHUR MATTHEWS, Nurseries, Waltham Cross.

WANTED IMMEDIATELY, a young MAN (18 to 20), active and willing. Handy with spade and quick at Potting, Watering, &c.—COLLINS BROS. AND GABRIEL, Waterloo Nurseries, Hampton, Middlesex.

WANTED, a CLERK. Must be well acquainted with Office Duties. Apply by letter only.—F. SANDER AND CO., St. Albans.

WANTED, a young Man, as JUNIOR CLERK. Must have exceptional references.—Apply by letter, stating age, experience, and where last employed, and amount of wages required, to R. J. T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, an ASSISTANT for Florist's Shop, where a high class business is done. Must be a first-class hand at Wreaths and Bouquets, and be of good address.—Apply, stating experience, wages, and full particulars, to SEASIDE, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENING APPOINTMENTS.

MR. CHARLES ENSOLE has been appointed Head Gardener to Colonel PREVOST, Elford House, Hawkhurst, Kent.

MR. JAMES FORD, for the last eighteen months Foreman in The Gardens, Taymouth Castle, has been appointed Head Gardener to W. D. DANESON, Esq., Violet Bank, Langside.

WANT PLACES.

Letters addressed "Foste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

Gardeners, Bailiffs, &c.

JOHN LAING AND SONS, having filled many important places, can RECOMMEND with every confidence, energetic and practical MEN of tested ability and first-rate character. Ladies and Gentlemen in want of Gardeners and Bailiffs, or Gardeners for first-rate establishments, or Single-handed situations, can be suited, and have full particulars by applying to us. No fees charged.—**JOHN LAING AND SONS,** The Nurseries, Forest Hill, S.E.

WANTED, A GARDENER!!!—Having had long experience and an extensive connection we are in a position to RECOMMEND MEN thoroughly capable of filling with credit any situation in the Gardening World. On receipt of full particulars we will recommend a suitable Man. Correspondence invited.—**R. B. LAIRD AND SONS,** Successors to Downie & Laird, Seed Merchants, Edinburgh.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SCOTCH GARDENERS.—**JOHN DOWIE** (of the late firm of Downie & Laird), Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of **SCOTCH GARDENERS**, waiting engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

HOLLOWAY'S OINTMENT and PILLS.

Coughs, Influenza.—The soothing properties of these medicaments render them well worthy of trial in all diseases of the respiratory organs. In common Colds and Influenza the Pills, taken internally, and the Ointment rubbed over the chest and throat, are exceedingly efficacious. When Influenza is epidemic, this treatment is the easiest, safest, and surest. Holloway's Pills purify the blood, remove all obstacles to its circulation through the lungs, relieve the overorged air tubes, and render respiration free, without reducing the strength, and irritate the nerves, or depressing the spirits, such are the ready means of living suffering when anyone is afflicted with Colds, Coughs, Bronchitis, and other Chest Complaints, by which so many people are seriously and permanently afflicted in most countries.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1888.

The Winners of every First Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens.

Patronised by—
 HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
 HIS ROYAL HIGHNESS THE PRINCE OF WALES,
 THE KING OF THE BELGIANS,
 The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
 And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 140,000 of these Machines have been Sold since they were first introduced in the year 1856.

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others. They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—

- 1st Simplicity of Construction—every part being easily accessible.
- 2nd. They are worked with much greater ease than any other.
- 3rd. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

SILENS MESSOR MOWERS, with Improved Steel Chains and Handles.

SINGLE-HANDED LAWN MOWER.

	Price.
To cut 6 inches, can be worked by a Lady	£1 15 0

Thursday May 17.

SPECIAL SALE OF ORCHIDS IN FLOWER AND BUD.

MR. J. C. STEVENS begs to announce that his NEXT SALE OF ORCHIDS IN FLOWER AND BUD will take place at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 17, at half-past 12 o'clock precisely, and he will be glad if Gentlemen desirous of entering Plants for this Sale will send List as soon as possible.

Sale Thursday, May 24, Without Reserve.

At 38, King Street, Covent Garden, W.C.
CATTLEYA LAWRENCEANA, specially large and fine flowered variety. See dried flowers.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 24, by order of Mr. F. S. Raven, a specially large and grand importation of *CATTLEYA LAWRENCEANA*. This consignment has been collected in a quite different district, from whence no *Cattleya Lawrenceana* have ever been introduced. There is as much difference between this and the ordinary *C. Lawrenceana* as there is between the starchy variety of *Odontoglossum crispum* and the broad petalled forms. The dried flowers on view will give some idea of the magnificence of this variety.
On view morning of Sale, and Catalogues had.

Southend-on-Sea.

To FLORISTS, NURSEYMEN, and OTHERS.

MR. A. TALBOT is instructed by the Lessee to SELL by AUCTION, at the Royal Hotel, Southend, on SATURDAY, May 12, 1888, at 4 o'clock precisely, the Valuable long Leasehold NURSERY GROUNDS of about 1 acre, known as "Raven's" Nursery Gardens. The whole to be sold as a going concern. On the grounds are three LARGE GREENHOUSES, two of which are fitted with Hot-water Pipes (with numerous valves) heated from a Weeks' Tubular Boiler, capable of heating 30,000 feet of 4-inch piping; there is also a capital Glass Pit, two Potting-Houses, two Cemented Water Tanks to hold about 1200 and 1512 gallons respectively. The whole held upon lease for 80 years from December 25, 1884, at the low rental of £20 per annum, the estimated rental value being £80 per annum. The whole of the Trees, Plants, &c., in the ground to be included in the Sale, the Purchaser to have the option of taking the choice and extensive stock of potted plants at a price to be quoted previous to the Sale.

Under instructions from the Freeholder, will be offered FOR SALE (immediately after above is sold), the FREEHOLDERS' INTEREST in the above-mentioned GROUNDS, GREENHOUSES, &c.

Descriptive Particulars, giving dimensions, &c., of Greenhouses, and conditions of Sale, can be obtained of the Solicitors, Messrs. BRIGHTEON AND LEWIS, 4, Bishopsgate Street Without, E.C., and Southend, Essex, or of the Auctioneer, Auctioneer's Offices, next the Bank, High Street, Southend, Essex.

WANTED TO RENT, a GARDEN, with Glasshouses suitable for Growing Plants, &c., for Sale. Address, FLORIST, Clifton Road, Weston-super-Mare.

RUGBY.—FOR SALE, 9-roomed HOUSE, 2 FARM BUILDINGS, and 19 Acres of rich LAND. Suitable for a good Gardener. £1750.—Apply to A. ABEL, Harrogate.

FOR SALE, a NURSERY, as a going concern. A well appointed Nursery, on the Bromley Road, at Beckenham, Kent. The Nursery is situated in an excellent neighbourhood, and a good Jobbing Trade may be made. A large Business has been done in Cut Flowers in past years. The Houses and Stock are in first-class order, and may be inspected.

For further particulars apply to Mr. E. ELLIS, Solicitor, 23, Birch Lane, London, E.C.; or, to Messrs. JOHN LAING AND SONS, Nurserymen, Forest Hill, S.E.

Hereford.

TO BE SOLD, a NURSERY and SEED BUSINESS.—The Premises consist of Four large Houses, Pits, and Frames, and Six-roomed House adjoining. A splendid opportunity for two pushing young men. There is a good business now being done, and every prospect of increasing this offers itself to any one knowing the trade.

For further particulars address J. CONROY, Auctioneer, Broad Street, Hereford.

FLORIST'S BUSINESS for Sale; fine position at low rent, small premium, long lease, good Wreath Trade.—MOYSESEVENS, 22, Stockbridge Terrace, Victoria St., S.W.

To Florists and Nurserymen.

LAND in the best part of Lewisham, where Glasshouses will be erected to suit tenants. Close to Lewisham Junction Railway Station, adjoining the river, and in full view from each line of railway.

TO BE LET, on LEASE, for 7, 14, or 21 years, on Plans and Rents to be agreed.

Apply, in first instance by letter, to

E. PARKER, care of J. S. Hodson, Esq., Gray's Inn Chambers, London, W.C.

T. JANNOCH, by Special Warrant, Lily of the Valley Grower to H.R.H. the Prince of Wales, Dersingham, King's Lynn.

HOME AND ABROAD!

AT the GREAT SHOW at GHENT, BELGIUM, commencing April 15, the *Gardeners' Chronicle* in a leading article says:—"Here Messrs. Cannell upheld the honour of their country."

The *Gardening World* says:—"His Majesty the King visited the Show, and, with his usual affability, conversed with Mr. Cannell, Sen., and expressed his great admiration of the perfection of his flowers. (By special request, Mr. Cannell had to be in attendance.) The Prime Minister, in shaking hands with Mr. Cannell, also expressed his great surprise and pleasure in seeing such lovely flowers from Kent."

The *Garden* says:—"Cannell's Cinerarias were admired for their perfect form, and it is evident Continental strains (although numerous exhibits were shown) are below ours."

CANNELL'S CINERARIAS.

Like our Primulas, both in competition and otherwise, they totally eclipse all before them. At the Regent's Park Show last week the *Gardeners' Magazine* says:—"Messrs. Cannell occupied the first place in nine plants of high quality, effective colouring, cultural skill and the plants may be described THE FINEST THAT HAVE EVER BEEN STAGED."

SEND FOR CATALOGUES.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.
"We have used STANDEN'S MANURE for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—C. M. HOVEY, Boston, U.S.A., May 27, 1887."

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in KEGS, at reduced prices, 28 lb., 12s. 6d.; 53 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS—
CORRY, SOPER, FOWLER & CO.
(LIMITED),
FINSBURY STREET, LONDON, E.C.

To Grow fine Vegetables and Flowers, Gardeners should use SULPHATE OF AMMONIA. One trial will prove the great value of this Manure, and ensure its constant use hereafter. It can be applied either separately or mixed with ordinary stable or farmyard manure. Rose Trees and Garden Plants are much benefited by being watered with a weak solution once or twice a week. Instructions on application, post-free. Price free on rail at Sheffield, 13s. per cwt., or 7s. per 56 lb. P.O. Orders payable to The MANAGER, Sheffield Gas Company, Sheffield.

SILVER SAND.—The best in England. Course or Fine for Sale. By railway truck loads, loose or in bags. Samples, advice, and particulars, may be had post-free. W. SHORT, Horticultural Depot, Midhurst, Sussex.

THE Gardeners' Chronicle.

SATURDAY, APRIL 28, 1888.

MARKET-GARDENS AND ORCHARDS.

WE have alluded on various occasions to the statistics furnished by the Agricultural Department and to the lessons to be derived from them, and now avail ourselves of a convenient summary of the subject provided in the last number of the *Quarterly Review*, and condensed for us by the writer of the article in question. The statistics of the home crops are first referred to, and it is pointed out that the returns of the Agricultural Department with respect to market gardens and orchards do not include nearly all the land devoted to culinary vegetables and fruit, because both are now grown extensively upon ordinary farms, as well as in noblemen's and gentlemen's gardens, and there are no columns in the schedules sent to farmers in which market garden crops, and large areas of such fruit as Strawberries and Raspberries, can be inserted. Last year the return, for Great Britain, the Isle of Man, and the Channel Islands, gave 63,140 acres for market gardens, 203,702 acres for orchards, and 12,533 acres for nursery grounds. Small fruit grown under trees is included in the figures for orchards, but the great Strawberry and Raspberry fields in Kent and elsewhere are not included. The figures for Great Britain (only) for 1867, 1877, and 1887, are as follows:—

	1867.	1877.	1887.
	Acres.	Acres.	Acres.
Market gardens	36,204	37,849	62,666
Orchards	148,221	163,290	202,234
Nurseries	11,779	11,952	12,478

It will be noticed that the increase in each division was much greater during the last decade than in the preceding ten years. In the ten years ending with 1877 there were increases of 1645 acres of market gardens, 15,079 acres of

orchards, and 173 acres of nurseries; while in the last decade the areas were extended by 24,817 acres for market gardens, 38,944 acres for orchards, and 526 acres for nurseries. It is certain, however, that the increase in acreage of land devoted to fruit has been much greater than is here indicated, as the writer explains. The acreage covered by market gardens in the counties which grow vegetables most extensively is next given, showing, of course, that the greatest areas are in those near London, Birmingham, Manchester, Liverpool, Edinburgh, Glasgow, Dublin, and other large towns. In the case of fruit, climate and soil have more effect upon the selection of districts than contiguity to the great markets.

POTATOS.

The figures relating to the Potato crop are next dealt with, and some people will be surprised to learn that the acreage of this crop in the United Kingdom, including the small islands, has decreased during the last twenty years. It was 1,500,860 acres in 1867, 1,394,553 in 1877, and 1,367,901 in 1887. In England and Jersey there has been an increase; but this has been more than covered by a decrease in Scotland, Wales, Ireland, the Isle of Man, and Guernsey. In spite, however, of the reduction in the area of the Potato crop, there is reason to believe that the produce has increased, not only because the yield in England and Jersey is much greater than it is in Ireland (where the falling-off has been most extensive), but also because more prolific varieties have been grown lately than those previously cultivated, and there has been less loss from disease. The "ordinary average" yield per acre is officially estimated at 6.32 tons for England, 5.43 for Wales, 5.79 for Scotland, and 6.11 for Great Britain, while a ten years' average for Ireland is only 3.30 tons. As to imports, it is surprising to notice how small they are in comparison with the bulk of the home produce. Including the supplies from the Channel Islands, they have amounted to only about 115,000 to 138,000 tons annually for the last three years, whereas we grow 6,000,000 to 7,000,000 tons in Great Britain and Ireland. The imports, moreover, have fallen off from 7,964,840 cwt. in 1877, to 2,762,958 cwt. in 1887, while the decline since 1880, when we imported 9,754,514 cwt. of Potatoes, has been greater still. Deducting the supplies received from the Channel Islands, which cannot be called "foreign," our imports of Potatoes are insignificant as far as quantity is concerned; and although they consist chiefly of new Potatoes, for which high prices are paid, the value of the whole of our foreign supply is less than half a million sterling per annum. In 1886, out of a total of 2,707,889 cwt., valued at £799,265, the Channel Islands sent us 1,288,961 cwt., valued at £459,395. Prices were excessively low in that year, the average value per ton of the imports being £5 18s., whereas in 1887 it was £7 1s. In the latter year the Channel Islands sent us 1,493,638 cwt.; France, 843,708 cwt.; Germany, 425,612 cwt.; and other countries make the total up to the quantity given above.

With respect to a table giving the details of imports and values for 1886, it is interesting to notice that the highest average price—£10 10s. per ton—is credited to Malta, and the next in order—£9 9s. 8d.—to Portugal, while the supply from the Channel Islands averaged £7 2s. 6d. Details for 1887, when prices were higher, are not yet available.

VEGETABLES.

It would be impossible to condense within a moderate amount of space the details given in the article as to the sources and periods of the home and foreign supplies of the various vegetables. Broccoli or Cauliflowers, it is remarked, are to be obtained all the year round. The Broccoli season is supposed to commence in December, or occasionally at the end of November, when considerable

quantities arrive [in London] from Cornwall and Cherbourg. Cabbages, Coleworts, and Brussels Sprouts are almost exclusively of home growth. Forced Asparagus is to be obtained in London all through December and January by those who do not mind paying 15s. to 20s. a bundle. The first supply of natural growth comes in about the second week of February from the north of Spain, and the French crop is ready early in March, English not being in considerable supply till the end of April. Green Peas have lately been sent to London in increasing quantities through April and May from Guernsey, where they are reared in cool houses. They commonly sell at 1s. per pound in the pod. French Beans, grown in hot-houses with Grapes, come from the Channel Islands as early as January, and some from France about as soon. The extraneous supply is kept up till the end of June, the bulk of the English produce not being ready till July. Mushroom-growing is referred to as highly profitable.

Foreign competition in the supply of vegetables to our markets, it is pointed out, has unquestionably increased. No quantities are given in the official returns for other vegetables than Potatoes and Onions; but the value of unenumerated raw vegetables imported has been almost constantly rising for more than twenty years. In 1859 it was £24,379; in 1867, it was still as low as £68,614, but rose suddenly to £134,376 in the following year. After a brief period of fluctuation, the value stood at £132,124 in 1875; and since that year there has been an unbroken annual increase up to 1887, when the amount was £600,882. In 1886, the latest year for which the full details of imports are available, the value of those received from France was £294,848, out of a total of £540,670. After all, however, the proportion of the foreign to the home supply of vegetables must be extremely small. Home growers complain that foreigners "take the cream off the market," and no doubt this is true, as the foreign produce comes before the English is ready, and commands extra prices accordingly; but it is pointed out that the Paris district, which has scarcely any advantage over the London district in respect of climate, and none over the South of England or Ireland, contributes a large proportion of the foreign supply of vegetables; and that the Paris market gardeners are able to forestall our own mainly by means of the use of glass, including the bell-glasses (*cloches*), which they extensively use. It is remarked, however, that the preference rail rates and superior train facilities offered by the railway companies to foreign producers handicap our own market gardeners unfairly.

FRUIT.

Turning to the fruit supply the writer first refers to Apples, remarking that the great bulk of the consumption is provided for by home growers, though imports, chiefly from the United States and Canada, and to a smaller extent from Paris and Holland, have increased in recent years. It is intimated that imports are encouraged, not only by a deficient home supply of the best sorts of Apples, but also by the neglect by growers of proper arrangements for storing their produce, and by their carelessness in sorting and packing. In a barrel of American or Canadian Apples, it is remarked, the fruit is all of fair size, and there is no difference in the sample at the top and at the bottom of a barrel. This is an instance of honesty being the best policy, for buyers have confidence that when they see a good display of fruit at the top of the barrel, they will find all good alike; whereas they expect to find the bulk in an English package inferior to the Apples on the top. Then, it is added, all but a very small proportion of the large area devoted to Apple orchards in this country is occupied with trees either of inferior sorts or too old to produce remunerative crops. The lack of legal security for planting done by tenants is mentioned as largely accountable for this state of things, though it does not explain neglect on the part of owners. With respect to the imports of Apples,

they have been separately enumerated only since 1881. In 1882 the quantity was 2,386,805 bushels, and in 1886 it was 3,261,460 bushels; while it fell to 1,948,843 bushels in 1887, mainly because of the deficient crop in America. Quoting an estimate given by Mr. Whitehead to the effect that a seven years' average crop of Apples in Kent would be equal to about 130 bushels per acre, the writer says that, at this rate, our imports in 1886 were equivalent to the produce of about 25,000 acres of orchards, producing as much as those of Kent, and that the value of the imports, £857,095, was equal to over £34 an acre on the area just stated. This large foreign supply, he declares, could be profitably superseded by Apples of home growth.

After the principal sources of the supply of other kinds of fruit have been given, reference is made to the greatly increased consumption of Grapes and Tomatos in this country, and to the success with which it has been met by a few extensive growers in England and Scotland, who are quite able to hold their own against the Guernsey men, by producing the two kinds of fruit in the same glasshouses until the vines completely cover the glass. The approximate London supply of English hot-house Grapes in 1886, according to Mr. Barron, was 400 tons, while the Channel Islands sent over 500 tons. One English grower, Mr. Ladd, of Bexley Heath and Swanley, sent 50 tons in 1887.

The imports of raw fruit, exclusive of Apples, which amounted to 2,614,046 bushels in 1882, fell off in the next three years; rose to 2,822,401 bushels in 1885, and fell to 2,601,334 bushels in 1886, and to 2,479,904 bushels in 1887. Thus it appears that if our foreign supplies of choice fruit have increased, those of common sorts have diminished. The enormous crop of 1886 brought down the prices of most kinds of fruit to a serious extent; and though there was a partial recovery last year, the glut which filled the jam factories in the previous year still had its effect.

HOPS.

The statistics relating to Hops do not embody any very great variations. The area was 64,284 acres in 1867, 71,230 acres in 1877, and 63,706 acres in 1887. Thus there is no increase in the home supply; and the imports during the last two years have been below the average of the previous ten years. The fall in value is well shown by the decrease in the average value of imports, which was £7 per cwt. in 1877, nearly £9 in 1882, £3 15s. in 1885, £2 18s. in 1886, and not quite £3 in 1887. The fall is attributed chiefly to the extensive use of Hop substitutes in brewing.

THE CHANNEL ISLANDS.

Flowers are briefly dealt with, and the concluding portion of the article is devoted to a description of the successful garden farming of the Channel Islands. In Jersey farmers pay commonly £9 to £10 an acre, and sometimes much more, for land on which to grow Potatoes, and yet make a living off small areas of land. Twenty acres is a rather large farm in Jersey, and as much as fifty acres is a very uncommon size for a farm. The average size is about 7½ acres. Last year Potatoes were grown on 6488 acres of land in Jersey, or about one third-of the cultivated area. The exports amounted to 50,670 tons, valued at £434,917. Here, then, was an average return of over £67 per acre, from which the expenses of sending to England should be deducted to get at the nett returns. But, on the other hand, part of the seed for another year was reserved, as well as a considerable quantity of tubers consumed as food during the summer. For winter use, Potatoes are imported by the Jersey people. As to Guernsey, the success of the garden-farmers there is mainly due to the extensive use of glass. Many of the smallest of the farmers have glasshouses, in which they raise Grapes, Tomatos, Potatoes, and Peas without artificial heat. The hothouses are chiefly in the hands of large growers, and of gentlemen who sell what they do not require for their own use. The returns of the Guernsey Chamber of Commerce show that the exports of vegetables, fruit, and flowers have nearly doubled since 1883. In 1887 about 500 tons of Grapes were exported, with 1000 tons of Tomatos.

The value of the exports of fruit, vegetables, and flowers is put down at £100,550 for 1887, and the list does not appear to be complete. Yet there are only 11,773 acres of cultivated land in Guernsey and the adjoining small islands, and the population is very dense. As in Jersey, though not to the same extent, there is some advantage in Guernsey as to climate; but the enterprise and industry of the people of both islands are remarkable, and chiefly account for their wonderful prosperity.

AUSTRALIAN BAOBAB.

In our last issue we gave an illustration of one of the giants of the vegetable kingdom in the shape

such nearly allied Bombaceous trees in such widely remote continents as Africa and Australia. The presumption of course is, that in some former state of the world's condition Baobabs or their representatives might have existed in the intervening countries where in consequence of changed conditions none now are found.

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM CONSPICUUM ×, *hyb. Angl.,*
orig. dub.

This is an exceedingly stately Cypripedium. Mr. R. H. Measures, the lucky possessor, compares its

which are very conspicuous. The inferior connate sepal is much narrower, oblong, acute, very light green, with thirteen light green nerves. Petals ligulate, broader towards the top, blunt, acute, ciliate on the upper margin, with dark mid-lines. Superior part almost black at the base, then chestnut, verging to reddish-ochre at the top. The inferior half is light brown, dark spotted at the base, verging to reddish-ochre at the top. The lip is nearly like that of *Cypripedium villosum*, but much larger, with much shorter horns, brown in front, ochre-coloured underneath. Staminate with ochre-brown blunt lobes outside, with a green apiculus, and a green callus inside.

This stately plant was purchased long ago by Mr. R. H. Measures, of Streatham, in a sale; its origin is unknown. It stands, no doubt, near the × *Harrisianum* group. It is astonishing in its large dimensions and short-horn on its lip. The varnish of the flower is excellent. *H. G. Rehb. f.*

CYPRIPEDIUM CONSPICUUM PICTUM +, *n. var.;* *hyb.*
Angl.

Perhaps this is an offspring from the same seed-pod as *Cypripedium conspicuum*. Its merit is based on a purple wash on both sides of the upper sepal, and a light green inferior base to the petals. It was likewise kindly sent by Mr. R. H. Measures, of Streatham. *H. G. Rehb. f.*

EPIDENDRUM STAMFORDIANUM (*Bat.*) LEEANUM,
n. var.

Mr. W. Lee sends me a lovely variety of this fine plant, in which the sepals and petals are covered with purple hieroglyphic-like markings on an ochre-coloured ground inside, scarcely translucent outside. The broad lip is of the lightest rose colour, and covered all over with fine purple spots inside. It is very distinct from *Epidendrum Stamfordianum* Wallacei. It was likewise collected by Mr. Alexander Wallace, who appears to have been singularly fortunate as to this fine species. I very gladly dedicate this very surprising plant to Mr. W. Lee, whose grand collection is so duly praised. *H. G. Rehb. f.*

CELOGYNE LACTEA, *Rehb. f., MSS. in litt. ad beat.*
*ex J. Day, Ap., 1884.**

My notes of 1884 state this to be an "awkward" plant. My meaning was, it was an awkward one to be named. I had it first from the late Mrs. J. Day, then something quite like it, but with a light brown top to the lip, from Mr. B. S. Williams; and finally I have now splendid materials from Major Lendy. The plant is much like *Celogyne flaccida*, as all the above-named orchidists have told me, and it may be compared to *C. Hutteriana*, which was sent me as *elegans* by Rev. C. S. P. Parish, as I knew *lutea* after being named though I am not very clear, whether the *C. Hutteriana* of this gentleman's, or his *Indy's* drawing, may not belong to this. Our plant has plump, short tumid shining light green wrinkled and costate bulbs and short, very thick, petioled enate oblong acute leaves (7 to 8 inches long by 1 to 9 inches wide). *C. Hutteriana* has much longer leaves, the median keel of the lip's disc obliterate, and the bulbs narrower. The side lacinia of the lip are blunt obtuse angled, and the lip has no gay yellow tint. The raceme is rather one-sided (one to eight flowered). The deciduous bracts are very broad, oblong, convex, acuminate. I have only received them from Major Lendy. The flowers are very much like those of the old *Celogyne flaccida*, Lindl., but the inflorescence is porrect. Colour cream-white, with a very lightest yellowish hue, with brown veins on the side lacinia of the lip on a light ochre ground, some bright yellow

* *Celogyne lactea*, n. sp.—Pseudobulbo abbreviato crasso fusiformi paucirostato; foliis geminis petiolatis cuneato-oblongis acuminatis valde crassis; racemo porrecto unilaterali 6-8 floro; bracteis cito deciduis late oblongis acuminatis concavis; sepalis oblongis obtuse acutis; tepalibus linearibus lanceolis trifido, angulis lateralibus obtusatis, lacinia media porrecta, carinis crassulatis tenuis n. basi in basin lacinia antice; androcinio trilobis seu bilobis. Ex Burnish import. ex. Lendy, Sunbury on Thames. *H. G. Rehb. f.*

FIG. 70.—THE AUSTRALIAN BAOBAB, ADANSONIA GREGORII.

of the African Baobab (see *ante*, p. 494). This week we are enabled to represent its Australian brother, *Adansonia Gregorii*. It is a native of the sandy plains of North Australia, and differs from the African species, *A. digitata*, in its smaller fruit with a shorter foot-stalk. It was originally discovered by Mr. Gregory, who records that the largest tree seen by him was 85 feet in girth at 2 feet from the ground. The pulp of the fruit has an agreeable acid taste, like cream of tartar, which is very refreshing to the traveller.

For our illustration (fig. 70), representing "a camp" of West Australian surveyors near Cambridge Gulf in the cool season of 1887, we are indebted to the kindness of Baron Ferdinand von Mueller. It would form the theme of an interesting discussion to inquire into the significance of the presence of two

growth and leaf to that of *Cypripedium Amesianum*. The leaf is ligulate-acute, more than an inch broad in the middle with sharp mid-nerve underneath. Colour of upper side deep green, with very obscure darker markings; underneath the colour is much lighter, and there is at the base a large number of small brownish dark spots.

The peduncle is dark brown, with numerous hairs which are not nearly so long as those of *Cypripedium villosum*. The fine apiculous bract surpasses in length half the ovary, and is covered with rows of dark lines and spots on the inferior part. Ovary green, with dark ribs, hairy, but not at all comparable to the hairiness of the above-named *Cypripedium*. Upper sepal broad, elliptic, acute, light green bordered with white, with fifteen to seventeen dark blackish nerves, which run nearly to the margin, and

at the base of the mid-lacinia and anterior sinus of the side lacinia very conspicuous underneath. Mid-line of the column and borders brown. Major Lendy imported a couple of small bulbs five years ago from Burmah, which have now flowered for the first time. *H. G. Rehb. f.*

ODONTOGLOSSUM EXCELLENS X **CHRYSEMELANUM**, *n. var.*

It is a remarkable illustration of the most uncommon good fortune that Sir Trevor Lawrence, Bart., M.P., P.R.H.S., after having had the genuine *Odontoglossum excellens* itself, should now be in possession of a new variety, *chrysemelanum*, which is spotted all over, and has neither a white disc on the upper sepal, nor on the petals, while the lip and the column are also yellow. It is a great beauty, and may be unique. There are, however, two other unique varieties, which may belong to *Odontoglossum excellens*. The one is *Odontoglossum excellens engenes* (*engenes*, Hort. Veitchi). It is very like *excellens*, but blotched on the petals. The other is *Odontoglossum excellens maculatum* (*Vuystekeanum maculatum*, Rehb. f.), which belongs, indeed, rather to *Odontoglossum excellens* than to *Odontoglossum Vuystekeanum*. It is easily discerned by the toothed petals and white column. *H. G. Rehb. f.*

ODONTOGLOSSUM HARRYANUM, *Mr. Wilson's variety.*

I have just received, through Messrs. J. H. Veitch & Sons, of Chelsea, a flower of a most distinct variety of this magnificent Orchid. It comes from Mr. Robert Wilson, of Mayfield, Falkirk, N.B., and may be distinguished as above. It may be briefly designated as a very fine variety, with the colours more intense than in the original form. The sepals are intense blackish-maroon, the yellow transverse markings and the yellow margin being almost entirely absent, while the same may be said of the petals. In the lip the maroon markings of the side lobes are more pronounced than usual. It is quite possible that in this, as well as in so many other Orchids, a considerable range of colour variation may be found to exist. *R. A. Rolfe.*

THE CLIVEAS AND THE AMARYLLIS.

At the Ghent Horticultural Exhibition I had the opportunity of making some interesting observations on the Cliveas. A large number was exhibited grown from seed. Some had fine large heads of flowers, all open at the same time, each flower being large, broad-petalled, of good form, and full coloured; others were of inferior form and colour. There was no great variety. I suppose the reason is, that there is only the one species known to horticulture, and therefore all are bred in and in; so that the degree of variation is small, and it would take years to produce any very striking divergence from the parent plants. [Among seedlings, all intermediate forms between the old China, with narrow pendulous flowers, and the new *Imantophyllum*, may be seen. *Ed.*]

The interest of the Clivea, however, from a morphological point of view, is, in my opinion, this. It might be looked upon as a regularly shaped *Hippeastrum*; the outer petals small, and the inner ones large, but, unlike those of the *Hippeastrum*, all are regularly placed, and of uniform colouring. Curiously enough, although the corolla is regular, the stamens and pistil are to the one side, and, like those of the *Hippeastrum*, mostly bent towards the inner and lower petal. As, however, the number of flowers on the Clivea head is great, some of the flowers, according to position, have their reproductive organs as above, others have them bent towards one of the outer petals, and others bent towards a point between the two. In all, the pistil was bent towards one side, but in some three stamens were bent towards the pistil and three erect; and in others among the central flowers the stamens were scattered, each lying on its corresponding petal.

Here, therefore, we seem to have the regular flower, or one like it, from which the irregular ones of the *Amaryllis* and *Hippeastrum* were developed

through insect agency. Probably in its origin the pistil was erect in the middle; but in such a position insects could get at the nectar without touching it. Once a variation occurred, in which the pistil was bent to the one side, it had a chance of becoming fertilised, and of propagating that variation. Another variation with some of the stamens bent to one side, also would increase the chance of fertilisation. Then the irregularity of the corolla, following the stamens and pistil, and its various colorations and venations, directing the insect's eye to the nectar-tube, would in time come about by the known process of natural selection.

From this point of view, and apart from its intrinsic beauty, I think the Clivea is a very interesting *Amaryllid*. Messrs. Boelens Frères, of Ledeburg, Ghent, are the most extensive breeders and exhibitors of this plant. As to *Hippeastrums*, there was nothing to be compared with those of Messrs. Veitch & Sons, Chelsea. M. Vuysteke and M. Dooghey exhibited seedlings mostly of the species with a large green centre, crimson tips, and streaks of the same colour; and Boelens Frères exhibited seedlings principally of the *vittata* species. *E. B., Ghent, April 18.*

ON THE USE OF NITROGENOUS MANURES.

From a series of investigations by Professor Paul Wagner, Director of the Agricultural Research Station at Darmstadt * endeavours have been made to assist in the solution of those questions on manuring which relate to the nutrition of cultivated plants with nitrogen.

1. *Does the Application of Nitrogenous Manure Produce an Increased Yield of all Crops?*—Different plants were manured with varying proportions of nitrogen per acre. The yields of cereal crops, Carrots, Potatoes, Turnips, Flax, Rape, and grass showed a considerable increase, and the gains were exactly proportional to the increase of manure, while on similar soils no extra yields of Peas, red Clover, Lupines, Vetches, and Lucerne were obtained; proving that leguminous plants obtain their nitrogen from sources inaccessible to the cereals, Potatoes and Turnips, &c.; and these supplies are so copious that under normal conditions of cultivation the plants do not need manuring with nitrogenous salts.

Should the soil, however, be poor, it is recommended to apply, even to leguminous plants, a small quantity of nitrogen in the form of nitrate soda or ammonium salts, to help them over a critical period of their growth, and to assist them in arriving as quickly as possible at that stage of development in which they possess the capacity of obtaining nitrogen from the air and subsoil.

2. *In what way does an increased yield result from the manuring with nitrogenous salts?*—The main object consists in endeavouring, by the supply of ample and easily absorbed nourishment, to bring the young plant as rapidly as possible to that condition in which it can offer successful resistance to all injurious influences, and then to carry it on to perfect maturation.

If the necessary quality of soluble nourishment is wanting in the soil, manuring with even a small amount of nitrogen considerably increases the yield of crop. At the same time it must be remembered that a plant does not live on isolated nourishing materials, but on a "food" composed of nourishing materials. A plant can form no leaves, no stems, flowers, or fruit from nitrogen, phosphoric acid, potash, or lime alone; the different nourishing ingredients must co-operate, and each must be present in proper quantity.

3. *Quantity of Nitrogen to be used.*—Plants require more than mere nutriment; they require water, warmth, and light. If there is a want of water or of light, or of warmth sufficient to produce a growth proportional to the nitrogenous manure given, the

excess of nourishing materials is of no use. Manuring with nitrogen can only take full effect so far as not only the other nourishing ingredients but also water, warmth, and light are present in sufficient amount. All other elements the cultivator gives in excess, but nitrogen should be measured out to the plants; with nitrogen he, so to speak, feeds his plants, regulates their activity of production, and puts them in a position to take full advantage of the favourable conditions of growth presented to them, permanently or at intervals—favourable characters of the soil, the climate, and the weather.

The pamphlet will repay a careful perusal. *John J. Willis, Harpenden.*

LANTANAS.

MR. THOMAS BAINES includes these—and rightly, too—among greenhouse plants. But they make very good summer-bedding plants also; for Mr. Barron frequently uses them with good effect in the gardens of the Royal Horticultural Society; and they can occasionally be seen bedded out in the London Parks and other places where bedding displays are made. M. Victor Lemoine, of Nancy, has been very successful in raising new varieties, and recently Mr. Barron grew a collection of them and others also at the Royal Horticultural Society's Gardens at Chiswick, having them in pots and treating them as greenhouse plants; this afforded a good opportunity of estimating their value as decorative plants under glass. One of the freest and strongest grown is named *Ver Luisante*, orange-red with orange centre, deepening in colour with age; the young flowers open orange, and deepen in colour as they mature. This would make a good exhibition specimen when well grown. *Le Styx* has very fine, rich, deep orange-red flowers, produced in large and bold trusses; it is a very free grower also. *Le Vainqueur* is very like *Le Styx*, but not so good in quality; and the former may be said to be put out of date by its newer *confère*. *Mons. Bouchardat* has fine and showy pale orange flowers; the individual blossoms are large, and they are produced in very fine trusses that are bright and striking; it is a remarkably good grower also, being strong and robust. Surprise is in much the same way, but paler in colour. *Le Patriote* is a very pretty variety; the flowers open pale gaulde-orange, changing to pink, and with a rosy-pink centre; a fine and distinct variety. *Venusta* is salmon coloured with orange centre; very fine in the pip and truss; distinct, and very good. *Clio* opens gold, and gradually changes to lovely rosy-purple; fine pip and truss, and a good free grower. *Triomphe du Commire* is of a pale lilac-pink colour, deepening in colour with age; fine pip and truss, and it can safely be marked very good. *Grisette* is lilac and mauve, tinted with rose; the flowers open pale lemon, and change to the above—a peculiarity with all the Lantanas; it is a good grower and very free. *Rosa Mundi*, rosy-purple, is very pretty indeed. *Souvenir d'un Ami* opens gold; the flowers then become orange-salmon, and finally the salmon deepens to rosy-purple, very fine pip and truss, and good habit. *Comtesse de Beneval* opens yellow, and changes to pale rosy-pink; it is a very pretty and free variety. *Meteore* opens cream, and changes to pink and pale rosy-lilac; it is a pretty and pleasing variety.

Coming now to what may be termed the yellow-flowered varieties, one of the best—probably the very best—yellow is *Reveille*, deep yellow in colour, very fine and free. *Pluie d'Or* is pale golden-yellow; flowers and trusses alike small. *Figaro* bronzy-yellow, is very free of bloom also. *Bijou*, orange and gold, is of dwarf habit, very free, and makes an excellent pot plant. *Grappe d'Or* is of a fine hue of gold, very dwarf in growth, and exceedingly free. *Californie* is of a distinct pale yellow colour, good close habit, and very free indeed.

One of the best whites is *Innocence*, it opens pale lemon or primrose, then changes to white; of good habit and very free. *Bonquet Blanc* is yellow, changing to white. Lastly, comes *Le Lis*, which

* Translated by George G. Henderson, M.A., B.Sc., and published by Messrs. Whittaker & Co., London.

opens pale yellow, and changes to pure white; good habit and very free. Perhaps, taking all things into account, this is the best white grown.

The best dozen varieties, selected from the Chiswick trial, will be found in *Ver Luisante*, *Le Styx*, *Mons. Boucharlat*, *Le Patriote*, *Venusta*, *Clio*, *Triomphe*, *Trompette de Comaire*, *Comtesse de Beneval*, *Reveille*, *Bijou*, *Innocence*, and *Le Lis*.

In some parts of the country a very fine and striking rich orange-crimson variety, named *Le Grenadier*, is grown as an exhibition plant, and in much the same style as a *Vinca*. I have seen very fine examples of this clothed with excellent foliage, and largely covered with fine and showy trusses of flowers. It gives a telling colour in a group of twelve or more specimens.

Mr. Baines remarks that the *Lantanas* were "once much more generally in fashion than they are now." They are quick growing evergreen greenhouse shrubs, easily cultivated, and blooming freely and continuously. They are all rapid growers, and should be liberally supplied with moisture when they are forming wood and flowers. *R. D.*

CYTISUS RACEMOSUS AND ITS ALLIES.

THERE is a small group of very handsome early-flowering *Cytisi*, in which some little confusion of names exists, and as I have lately had to look into the matter, it may be of interest to place the following notes on record. *Cytisus racemosus* first appeared in Marnock's *Floricultural Magazine and Miscellany of Gardening* in 1837 (vol. ii., p. 37, t. 19), as follows:—

"Messrs. Fisher, Holmes & Co., of Handsworth Nursery, exhibited, in May last, a handsome specimen of this plant in full bloom. Its appearance is that of a hardy shrub, of moderately robust habit, forming a handsome bush, 3 feet or upwards in height. The leaves are alternate, stalked; leaflets three, ovate-lanceolate, of a somewhat silvery appearance. The flowers are terminal, about 6 inches in length, and of a bright yellow colour. Its flowers are produced during May and June. We have been assured that this plant is quite hardy, and we shall indeed be delighted if it really prove so. We can ascertain nothing more of its history than that it was first introduced into this country by Messrs. Young, of Milford. Solitary plants have found their way into other nursery establishments, but it is reported as exceedingly rare. We hope shortly to give additional and more satisfactory information respecting it."

There is a matter of considerable interest about this record, for which purpose I have reproduced it *in extenso*, namely, that it refers to a different plant from the one now universally known in gardens as *C. racemosus*. The plate represents a plant with larger, more elongated leaflets, and identical, I am convinced, with *Cytisus stenopetalus*, a Canary Island plant, which may now be seen in flower in the greenhouse at Kew. How the name became transferred to its present owner I am not prepared to say; but this plant appears to have a yet earlier record. I believe it to be the one described by Link in his *Enumeratio Plantarum Horti Berolinensis* (vol. ii., p. 224), as *Genista bracteolata* as long ago as 1822. Link's description is rather short, but there is a specimen so named in the herbarium of the late Thomas Moore, now at Kew, which agrees in every respect with this description, and which on the other hand is apparently identical with the *Cytisus racemosus* of gardens. Perhaps our Berlin friends may have Link's authentic specimen, and will be good enough to say if I am right on this point.

Cytisus Atleeanus of gardens (or *Atleyanus*, as spelt in Koch's *Dendrologie*) is a very old plant, the *C. ramosissimus* of Poiret. It has smaller, more rigid leaflets than *C. canariensis*, and a more compact habit; but I doubt if it represents more than an extreme form of that well known species, although Webb keeps the two distinct. The origin of the garden name I do not know.

C. Everestianus is said to have been raised in some garden; it is very similar to the garden *C. racemosus*, but the flowers are of a deeper colour, the leaflets more silky, and the habit a little more compact. It is well figured in the *Revue Horticole* for 1873, p. 390.

Genista Spachiana, Webb, *Bot. Mag.*, t. 4195, is another Canary Island plant of the same group. Webb, who contributed the text of this plate, remarks that the plant is indigenous to the high mountains of the north-west of Teneriffe; and that it was omitted from the *Phytographia Canariensis* because the author had seen only fruiting specimens, and could not decide on the specific value of the plant. It had now flowered from seeds formerly sent by him to Europe, both at Mr. Young's nursery at Milford, near Godalming, and at the *Jardin du Roi* at Paris. He also mentions two other new species, one of which he calls *C. discolor*, and which had also flowered in Mr. Young's nursery. This was in 1845, and it is a significant fact that Marnock's *C. racemosus* originated in the same nursery some few years before. It is possible that Webb may have sent seeds of all three species to Europe. This would throw a further side light on the identity of *C. racemosus*, Marnock, with *C. stenopetalus*, a well-known Canarian plant; while of *C. racemosus*, Hort., I have not as yet been able to discover any wild specimens.

The species of this group were formerly included under *Genista*; afterwards elevated by Webb to the rank of a distinct genus, called *Teline*, but now regarded as a section only of *Cytisus*. The group comprises about twelve species, three of which are limited to Madeira, six more to the Canary Islands, two are common to the Canary Islands and the western Mediterranean region, while the remaining one is only found in the region last named.

I am unable to identify *C. racemosus*, Hort. (*Genista bracteolata*, Link.) with any of the above, which is rather singular, considering how long it has been in cultivation. In habit it closely resembles *C. canariensis*, but it has not the spreading pubescence of that species, and in this respect it rather approaches the silky pubescence of *C. stenopetalus*. So that, after all, the plant may be a very old garden hybrid. If there is anyone interested enough in the question to try the result of hybridising these two species together, it might perhaps help us to arrive at some more definite conclusion on the point, for it is unfortunate that the origin of so useful a plant should be involved in so much obscurity. *R. A. Rolfe.*

PLANT NOTES.

PLEUROTHALLIS INSIGNIS.

This distinct and handsome plant, whose flowers are quite gigantic for the genus, is again flowering in the Kew collection, this time the raceme bearing four flowers. It was described by me in these pages about a year ago, and a figure may also be found in the *Botanical Magazine*. Three of the four buds are unexpanded at the moment of writing, and, singularly enough, in each of them may be seen through the semitransparent tissue at the sides of the buds numerous glistening drops of water. I do not know if the feature is constant, but do not remember to have observed it before. In any case it has been deposited there as a result of ordinary nutrition, not by extraneous means. *R. A. R.*

BROWNEA MACROPHYLLA.

Flowers and leaves of this remarkable plant have been sent to Kew by W. H. Crawford, Esq., of Cork, who has long possessed plants of it, as is shown by the description and figure published in the *Gardeners' Chronicle* in 1873 (p. 779), and in the *Garden* in 1879. The plant is large, with a thick woody stem, and the flower-heads, some of which have been described as being over 3 feet in circumference, are similar in shape to those of *B. grandiceps*, but the stamens are much longer; they are bright scarlet in

colour. The head is almost sessile on the woody stem, and Mr. Crawford states that the flowers are developed most freely on those parts of the stem which are shaded. It is just possible that *B. macrophylla* is a hybrid, *B. grandiceps* and *B. coccinea* being the parents. The latter species produces its flowers on the woody stem and branches. The large shining green foliage of *B. macrophylla* suggests the idea that it is a hybrid from these two. A figure of it has been made for the *Botanical Magazine*. *W.*

HARDY PERENNIALS FROM SEED.

OF late years the cultivation of hardy perennials has increased to such an extent that it is no idle phrase to say, the man who has charge of a private garden and who fails to study their cultivation and nomenclature, is not abreast of the requirements of the times, and the sooner he recognises this fact in a practical form the more it will be to his advantage. The subject of nomenclature we need not enter into here; suffice it to say, it will be found to be good mental exercise, and to persons possessed of a fairly good retentive memory, its acquirement is easy. The raising of perennials from seed is but little practised at the present time in private gardens, and has been hitherto confined chiefly to trade growers, curators, and superintendents of botanical gardens and public parks—a circumstance due to the fact, that this method of increasing stock of any plant is the best and most expeditious. In many gardens the prevailing mode of increasing the stock of a recently purchased plant is either by division or cuttings, and this in some cases is a very slow process indeed, and with certain species of plants it will take years to obtain a sufficient quantity; whereas if seed were sown and properly treated, enough and to spare might be obtained in half the time required by other methods. It may sometimes happen with new introductions that seed cannot be purchased for some time afterwards; when this is so, plants should be obtained, and no pains spared to induce them to ripen seed after their first flowering. Seed saving, however, is a large subject, upon which we cannot now enter into many details, but it should not be done in a haphazard manner, but both care and forethought must be brought to bear on the operation. For instance, to reproduce a species true from seed, the parent plant should be isolated; but ought not to be grown near other species belonging to the same genus which may be flowering about the same time, or hybrid varieties would probably result—a circumstance which might prove to be a disappointment, or the reverse; but the probabilities are that the original object in view would be defeated. With regard to sowing the seed, the best time, generally speaking, is from the middle of March to the end of April, and for some kinds in September and October.

It may be mentioned, for the benefit of those hasty persons who would throw a pot of seed away because no plants appeared in a few months, that much patience is wanted; and it will be found that some will germinate in a few days, whilst others again will remain apparently dormant for a whole year, and longer, and no definite time can be stated for any particular species. The most suitable compost will be found to be finely sifted loam, leaf-mould (not much for seeds slow to grow), and silver-sand, mixed in the proportion of two parts of the first-named to one each of the two latter, care being taken to pick out all worms or grubs from the soil before using it.

As regards pots the most convenient size to use are 32's, and these should be well drained, filling them quite one-third of their depth with broken potsherds, over which place a layer of moss of rough siftings. In making them up with compost press the latter down moderately firm, and fill to within half an inch of the rims, so as to allow room for sufficient water to moisten the whole of the soil at each watering, which should always be given through a fine rose for the first few times. In sowing, the thickness of soil over the seed is of much importance; as a rule, the

smaller the seed is the nearer the surface it should be; and in practice it is found a safe plan to cover each kind with about its own thickness of soil. After the seed is sown the pots should never be allowed to get quite dry, therefore shading should be resorted to on bright sunny days; on the other hand an excess of moisture must be avoided, or the result will be the appearance of moss on the surface of the soil, which is very injurious to all seedlings. Do not place the pots of seed in artificial heat, with the idea that germination will be accelerated thereby; the best places for them are unheated brick pits, and if these are in a damp situation they should have some hard drainage material placed at the bottom to the depth of a foot, and over this a bed of sifted cinder-ashes of sufficient depth to allow the pots to stand a few inches clear of the glass. The young plants, when large enough to handle, should be potted off into thumb-pots, or pricked out round the sides of small 60's, three plants in each, shifting into larger pots as soon as more root space is required; in some cases this second shift will be sufficient, and the plants may be planted out in the borders the following autumn or spring; but with some species another year in pots will be required before they are large enough to plant into their permanent quarters.

Young plants in frames must be guarded from the ravages of snails and woodlice, or the young seedlings of some species will disappear with rapidity; the first-named should be ensnared by baits of tender vegetable leaves, or better still to examine the interior of the frames after dark with a lantern. Woodlice are best caught in small pots half filled with hay or moss, a small piece of Potato being put at the bottom. When moss grows on the soil, on its first appearance it should be removed with a pointed stick, or it will overrun the surface soil, when its removal is fraught with much risk to the young plants or seeds. When the young plants have made their appearance, free ventilation must at once be afforded them, and all kinds of coddling, such as overhead syringing early in the afternoon, and shutting up the frames with plenty of sun-heat, with the object of hastening growth. It is better to take off the lights in the day-time, and to leave a little air on all night. We have known some gardeners raise young plants by sowing seed in outside borders at the end of April, or in pots standing in the open air, but generally we do not commend this practice, for it causes a large percentage of losses. *J. Horsfield, Heytesbury*

NOTES FROM BELGIAN NURSERIES.

JULES DE COCK'S NURSERIES, LEDEBERG AND MEIDELBERG.—This establishment may certainly be considered one of the most prosperous in Ghent, and it reflects all the greater credit on its proprietor, that he has built it up to its present condition by dint of hard work and perseverance. M. de Cock is not content with the labours of the immense culture which is necessitated in connection with the raising and growing every year of some 300,000 Palms, such as Kentias, Coryphas, Latanias, &c., many thousands of Azaleas, Camellias, Spireas, and other things in great quantities, but on him falls also the weight of the plant sales of Belgium, and for the convenience of them extensive sale-rooms are fitted up at the Ledeburg nursery, the first sale taking place in them in February of this year. So far, the result has been eminently satisfactory, and it is anticipated that, in Orchids especially, these sales will prove a good thing.

Cypripediums now seem the fashion in Orchids, and at Ledeburg there are a goodly number of them, most of the rare varieties being represented. In flower were some good specimens of *C. vernixium*, *C. Dauthieri marmoratum*, various forms of *C. Argus*, some of them very handsome; different varieties of *C. barbatum*, *C. callosum*, *C. Harrisianum* and *C. H. ingrum*, the latter with very dark and shining

flowers; a new form of *C. Lawrenceanum*, with very narrow segments. Many other rare species are in bud, and the collection is already a tolerably complete one. Among the other Orchids we noted in bloom *Dendrobium Ainsworthii*, and a few *Cattleyas*.

Cliveas here, as in most other Ghent nurseries, are a good feature, their orange-scarlet flowers making just now a fine show. Bromeliads, too, are in great force, Kentias in all sizes in large quantities, *Aspidistra lurida variegata* in plenty, *Ficus elastica*, many thousands in small pots; *Pritchardias*, good; *Araucaria glauca robusta*, in fine specimens; *Camellia alba plena*, large specimens, covered with flowers; and *Strelitzia augusta*, *Cocos* and other Palms, and Cycads in seemingly countless numbers.

The large establishment at Meirelbeke has 20,000 *Azalea mollis*, large quantities of cold-house Palms, *Azaleas*, *Camellias*, *Deutzias*, *Hydrangea paniculata*, Bay trees, and all the usual run of those plants denominated decorative, and which meet such a heavy demand in Belgium.

MR. CHAS. VUYLSTEKE, LOOCHINST-LEZ-GAND.

Here also a very large quantity of Orchids is cultivated, and Orchid lovers especially should visit the nursery. Some idea of the extent and quality of the stock may be formed by the sample that M. Vuylsteke sent to the Exhibition, which occupied a whole house, while the same exhibitor contributed fifty distinct *Odontoglossums* to one competition, thirty to another, and fifteen to another. In this nursery *Azaleas*, *Rhododendrons*, *Cliveas*, and many other things, will be found cultivated to a fine pitch. *Amaryllis*, too, are well represented for the Continental strain. The *Azalea mollis* are especially fine, and the *Azalea mollis* hybrids with double flowers comprise some remarkable and beautiful things.

(To be continued.)

THE BULB GARDEN.

DAFFODILS AND THE FROST.

We are accustomed to think Daffodils amongst the hardiest of plants; but I am sorry to say that instead of "taking the winds of March" this year, the winds of March have taken them to an extent I never saw before. I have always found that a south or south-west aspect suits Daffodils best, on account of the usual prevalence of north-east winds at their flowering time, which are apt to stunt their growth. But this year they have been killed outright by hundreds in beds exposed to the north-east without any shelter. They do not seem to suffer where they grow through grass, and I believe the mischief is caused by the violent wrench given to the leaves and stalk during the hard freezing of the wet soil. The action is the same as that which ejects wooden labels and weakly-rooted plants out of the soil; the Daffodil bulb being too deep to be ejected, the upper growth gets so violent a strain as to kill it. On examination of the dead tops it is evident that the mischief is just at the ground line. The destruction is greatest amongst the forwardest Daffodils, the common *Telamonius* having suffered equally with *Ard-Righ* and *Pallidus præcox*. Wherever these are protected from the north and east they remain unhurt. *Iris reticulata*, of which the stalk is less succulent, is nowhere hurt. *C. Wolley Dod*, *Edge Hall*, *Malpas*, April 12.

THE TIME OF LIFTING DAFFODILS.

In the very interesting paper you reproduce (p. 488) from Mr. Walker, of Whitton, on Daffodils, he pointedly speaks of "the time of lifting;" and further, "I wish to lay particular stress on the matter of storing." I merely draw attention to the point, as hitherto in my own limited, though representative collection, except to renew a bed or border, I never think of lifting or storing every year. One of the largest and most complete collections in Ireland is that in Trinity College Botanic Gardens, and I believe I am correct in saying Mr. Burbidge does

not lift every year, and I believe Mr. Hartland's custom is similar. However, my main object is to ask your readers, Is the evidence in favour of lifting every year? I have *cernuus moschatatus* planted out three years—not naturally robust—and it never, even in Holland, bloomed finer than this year. The same is true of *N. incomparabilis Leedsii*, *N. I. Mary Anderson*, *N. I. Stella*, *N. "Leda"*, *Grand Monarque*, *Diomedes*, *biflorus*, *Capax*, *Emperor*, *Empress*, but especially *bicolor Horsfieldii*. *W. J. Murphy, Clonmel*.

DOUGLASIA.

ONE of the most charming and appropriate "exhibits" at the first meeting of the Royal Horticultural Society in its new quarters was the humble little plant selected to bear the name of its discoverer, David Douglas. All gardeners who know plants well, and all botanists, will remember the debt of gratitude we owe to the intrepid Douglas, who conferred so much honour on the Royal Horticultural Society by the value and interest of the plants introduced by him from North-west America, and who subsequently met with so sad a fate in the Sandwich Islands. A short notice of Douglas' career and a portrait appeared in our columns on August 8, 1885. The Douglasias are little alpine plants, closely allied to and representing the *Androsaces* of the European Alps, and both being included among the *Primulaceæ*. The present species, *D. laevigata*, was exhibited from the Royal Gardens, Kew, and has broader leaves than most of its competitors, and pretty rose-coloured flowers. All lovers of alpine who were fortunate enough to see this little gem at the Drill Hall will be desirous of growing the plant, the other species of which present no special difficulty in their cultivation. For the drawing, whence our illustration (fig. 71), we are indebted to Mr. Thiselton Dyer.

SCOTLAND.

FERGUSLIE.

This unpretentious structure was the family residence of the late Thomas Coats, an ardent patron of horticulture, and one of the founders of that wonderful industry of thread-making, which along with shawls, has made the name of the township of Paisley famous throughout the civilised world. This industry, judging from the immense piles of buildings that are being periodically reared as adjuncts to the old works, must have quintupled itself within the last ten years. The founder of this branch of the family has joined the majority, but Mrs. Coats and her family seem to be carrying out the late gentleman's hobby (horticulture) most energetically.

Ranges of houses for plant-growing, houses for fruits and forced flowers not less conspicuous, have been added to the existing structures. The new fruit-house is used partly for Peach and partly for Rose-culture; and no expense seems to have been spared to make good and useful houses. The vineries are span-roofed, running north and south, and, bearing in mind the time they have been planted, show excellent returns. In addition to excellent Black Hamburg and Muscat Grapes here were some specially fine Pearson's Golden Queen, of amber finish and even-sized berries that would please any fruit grower. Mrs. Pearson was also good, and Gros Maroc particularly noticeable for its large berries and fine colour. The borders were chiefly inside, but doubtless they will be extended as time goes on. Peaches and Nectarines have been planted—good-sized examples, and their bearing capacities were not in any way affected by removal. *Maréchal Niel* Roses are in much request, and so is *Heliotrope*, both of which are to be found on the back wall. There were pits behind the house where Melons, Cucumbers, Tomatoes and flowering plants could be grown. The Orchids

are limited in number, but comprise among them, as is well known, some choice species of *Vanda* and a particularly fine *Angraecum sesquipedale* with a centre of twenty-four leaves surrounded with five strong breaks. Then there are the usual species and varieties of *Cattleyas* and *Laelias*, *Pleiones*, &c., intermixed, in some cases, with Ferns, making up an interesting house.

The new range adjoins the house itself, and has in the front a fine well-kept lawn and some carpet-beds. It is 160 feet long, 50 feet wide at the centre, and narrows to about 24 feet at the ends. The central portion is about as lofty as it is wide, in order to afford head-room for some great *Alsophilas*, *Dicksonias*, and *Cibotiums* that had been grown in time past in the old houses and required more space. They are planted in tubs, and surrounded by a border, which separates the footpaths of mosaic work from the pillars that surround the house. Climbers cover the columns with leafy embroidery,

maintained had a pleasing appearance. In the lower houses were good *Eucharis*, *Pancreatiums*—two very useful plants, where large supplies of cut flowers must be furnished; with *Crotons*, *Acalyphas*, *Sonerillas*, and some well grown and flowered young plants of *Gardenia*, bedded out alongside the boundary wall, along with which were some promising plants of *Cologyne cristata*. In one of the houses adjoining the large *Camellia*-house were some veterans, which are in demand at *Ferguslie*—*Begonia manicata* and *Euphorbia jacquiniflora*—staple plants forty years ago, and not to be overlooked now.

The *Camellia*-house is a spacious one, and at the present time not overcrowded. The varieties comprise many of the well-known ones, and here is a good specimen of an Orange tree. *Lapagerias* are here the chief climbers, and both white and red varieties were growing well, and bore large quantities of flowers. The wood employed in the

meeting of the Scottish Horticultural Association by Mr. Robertson Munro.

The genus *Ilex*, the author said, comprised upwards of 150 species which were widely distributed throughout tropical and temperate regions. Europe could claim but one species, the so-called species, *I. hibernica*, being only regarded as a variety of the extremely variable *I. aquifolium*. In China and Japan about a score of species were found, in the East Indies about two dozen, and about sixty in South America which is the great centre of the genus. A few solitary species are also found in Fiji, Australia, Tropical and Southern Africa, Madagascar, &c. For general decorative and shelter purposes in Britain the most important of all *Hollies* was our common native one which merited all the praise bestowed upon it by the enthusiastic Evelyn, who thought nothing "under heaven more glorious and refreshing than such an impregnable hedge glittering with its armed and varnished leaves, the taller standards at orderly distances blushing with their natural coral." Quoting Johnson, the author said Evelyn had a *Holly* hedge at Say's Court, which was planted at the suggestion of Peter the Great, when he resided there while working in Deptford Dockyard. The hedge was 400 feet long, 9 feet high, and 5 feet broad. A paper read to the Royal Horticultural Society by the Secretary, Joseph Sabine, more than sixty years ago, and published in vol. vii. of the *Transactions* of that Society, gave a full description of the remarkable *Holly* hedges at Tynningham, Haddingtonshire; Colintow House Midlothian; Hopetoun House, Midlothian; and at Gordon Castle. Were the present conditions and measurements of these plantations put on record, it would be of general interest. Regarding the well-known variability of sexuality in the *Holly*, some flowers being male, others female, and others again hermaphrodite—many individual plants varying from year to year—the author said it would lead to valuable and interesting data if those having collections of *Hollies* would note, and put on "record, season by season, for a number of years, the observations of the behaviour of the different varieties." The remainder of the paper was devoted to an interesting and detailed account of the uses of the *Holly* at home and abroad, its propagation in this country, and its culture, transplanting, and an enumeration of species and varieties. Seventy-two species and varieties were enumerated, and specimens of most of them were placed on the table for inspection by the members.

FIG. 71.—DOUGLASIA LEVIGATA; HARDY ALPINE. FLOWERS ROSE COLOURED (SEE P. 524).

and hang from the ironwork that binds the roof together. The climbers consist of *Tacsonia Volxemi* and *T. exoniensis* ×, which have the advantage of covering spaces greater than most of their compeers.

At either side of the great centre house are span houses, longitudinally divided, and having at either end spans with octagonal ends, thus making handsome structures. No. 1, at the west wing, contains Heaths and New Holland plants; No. 1, at the east, is the Palm-house. Here were good samples of *Phoenix dactylifera*, *Thrinax argentea*, one of the best; *Phoenix rupicola*, *Kentia Fosteriana*, *Areca sapida*, and its *nole-me-tangere* neighbour, *Areca horrida*—a grim-looking subject among its fellows. Nothing was finer than *Pritchardia pacifica*, with the fine silvery sheen on both rachis and fronds as seen in subdued light. The climbers here were *Stephanotis*, *Clerodendron Balfourii*, and *Bougainvillea glabra*. The whole of the centre groundwork was carpeted with *Selaginella casia*, which owing to the temperature

erections is *Teak*, and the glass 21 or 26 oz.; and taken as a whole it is one of the most commanding ranges of horticultural glasshouses in the West of Scotland, and for construction, style, and finish, heating and internal fittings it is unequalled.

The grounds have been laid out for some years, and although the plants are increasing in bulk there is not that general vigour about either shrubs or trees that we expected to see in a locality uncontaminated by smoke. All manufacturing towns are more or less baleful in their way to tree life, and some kind of indoor plants, notwithstanding all precautions, are affected by a begrimed atmosphere. The whole place is under the superintendence of Mr. McDonald, a painstaking and thoughtful gardener, who appears to command the full confidence of his employers. A.

"A CHAT ABOUT HOLLIES."

A paper by Mr. G. Nicholson, of the Royal Gardens, Kew, with the above title, was read at a recent

SOME VEGETABLE PRODUCTS FROM MINCING LANE.

To those acquainted with vegetable economic products, but who at the same time have no commercial training, it is interesting to watch the reports from the principal centres of commerce, showing, as they do, the fluctuations to which certain products are liable. The reports of the London drug sales are peculiarly striking in this respect; for though, like other trade reports, they are clothed in the usual technical language, they give a pretty good idea of the value of some regular articles of trade which in the course of the year make up a considerable total.

Under the head of Essential Oils, for instance, we find, perhaps, the widest range of prices, from oil of Sweet Almonds, at 1s. 6d. per pound, to Mitcham Peppermint oil, at 32s. per pound, and oil of Cubebs, at 58s. per pound, or Ylang-Ylang, at 20s. per ounce, besides many at intermediate prices, all of which, however, are liable to considerable fluctuation according to the supply and demand. Thus, at the close of last year it was stated that the shipments of Citronella oil from Ceylon were the largest on record, having amounted, from October 1 to November 17, to 1,657,752 ounces, against 313,632 ounces in the previous year. This oil always fetches a low price here, being quoted at the present time at about 2d. an ounce. It is largely used in perfumery. This forms a striking contrast to another perfume

oil, Patchouly, which ranges from 2s. 3d. to 3s. per ounce.

Amongst other well known products that have attracted much attention of late may be mentioned Coca leaves (*Erythroxylon coca*), Kola nuts, the seeds of *Cola acuminata*, and *Ipecacuanha*. Of Coca leaves it was reported in December as follows:—"Of forty-eight bales of Huanocho leaves, mostly rather dark, five bales, the best of the lot, good greenish, of new import, sold at 1s. 4d. per pound, one penny more than was recently paid; fourteen bags of low brown, badly sea-damaged, 1 cwt. each, were offered at 2s. 6d. for half the lot, but could not find a buyer. A commission which was appointed some time ago to report upon a scheme for assisting the development of minor planting industries in Guadeloupe, has recommended the introduction of Coca cultivation into the island, and suggests that loans upon easy terms of repayment be granted to planters embarking in this industry. It is suggested that 400 francs per hectare (equal to about £7 per acre) should be the maximum amount lent." The latest quotation for fair Huanocho was 1s. 4d. per pound. Regarding Kola nuts, very large quantities of freshly gathered seeds have recently found their way into the market, realising 9d. per pound for very fine quality, 4½d. to 5d. per pound for good, and 2½d. to 3½d. for ordinary mouldy.

Some time since four bales—in all about 400 pounds—of a root imported from Bombay as "Medicine Root," appeared at Mincing Lane, and was sold for *Ipecacuanha* at from 1s. 11d. to 2s. per pound. It was soon found, however, not to be *Ipecacuanha*. The root occurs in pieces about an inch long, and an eighth of an inch in diameter. It is not so regularly annulated as *Ipecacuanha*, and is apparently more branching, or with stronger root fibres; internally it is nearly white, with a very pale ring, and apparently very starchy. It has very little taste when first chewed, but shortly reveals an acrid and biting taste. The root has been proved to contain neither emetine nor any other alkaloid, and its botanical affinity cannot, at present, be determined. This false *Ipecacuanha* has created a good deal of interest amongst pharmacists, and all those interested in the purity of drugs. The *Ipecacuanha* supply has been exclusively brought from Brazil until a short time since, when a sample of very good quality found its way to the London market from Singapore, where it had been cultivated. It having thus been established that the drug can be grown in the East no doubt led the buyers to believe that this new root was Indian grown *Ipecacuanha*.

Speaking of adulteration, we may refer to the fact that *Cubebs* are now so frequently mixed with various other berries having so similar an appearance externally, that it is difficult to ensure the purchase of the genuine fruit. Quite recently it was reported that the supply of genuine berries is very small, and that as much as £20 has been privately paid for them.

Regarding Vanilla, it was stated during December that the cultivation of the plant in Madagascar was progressing, and that a splendid crop had been secured during the past season on two new plantations in the island, one of which is owned by an Englishman, and the other by a Frenchman. The former is laying out plantations on a very large scale, and it may now be considered certain that, under favourable circumstances, Madagascar Vanilla will ere long be placed on the European markets in considerable quantities. The beans cured last year are said to be by far the best ever produced in Madagascar. In connection with the spread of Vanilla culture, we learn from Zanzibar that it has been successfully tried at one of the East African German settlements, and that 55 lb. of Vanilla from the Knigaru (Usanbara) settlement are ready for shipment to Germany by the first steamer.

Some time since a good deal of interest was excited by the statement that 537 packages, amounting to about 50 tons, of gum of the Arabic character, had been received in London from Para, under the name of Brazilian Gum Arabic. We now

learn that only an overland sample has been received, and that the bulk is shortly expected. Referring to this gum, *The Chemist and Druggist* said:—"Since the great advance took place in values of gums generally, certain varieties of gums found in Brazil have received considerable attention at the hands of merchants in that country, who recognised in the product an article well worth collection and exportation. Accordingly, during the past two years, regular supplies of gum have been received at Liverpool from various Brazilian ports—Maranhão, Paranybu, and Para. These imports at first realised as much as 85s. per cwt., but it was found on trial of the quality that this was too high a value compared with other descriptions of gum, and as the imports increased, the price declined to 65s. per cwt. for good quality, at which figure the article sold very readily, until latterly the supply has somewhat exceeded the demand, and stocks have accumulated to about 95 tons, the market value of good quality being thereby reduced to 55s. or 57s. 6d. per cwt. Hitherto the Brazilian gum has been chiefly bought up by export druggists, but recently consumers in this country have turned their attention to it, and employed it successfully for various purposes. The tree yielding Brazilian Gum Arabic is called 'Angico' by the natives of that country."

The writer of the foregoing in *The Chemist and Druggist* suggests the source of the gum as *Bowdichia major*, but the Angico tree is referred to *Acacia angico*, Martius = *Piptadenia rigida*, Benth., which is described as yielding a gum very similar to Gum Arabic. *John R. Jackson, Museum, Kew.*

THE HERBACEOUS BORDER.

HEPATICAS.

ALL my clumps of *Hepaticas* that are growing in the open air are blooming with remarkable freedom this season. They are under an east wall, in the full blaze of the summer sun for a considerable portion of the day, but they do remarkably well. The single blue, especially, makes a great display; the clumps are very strong; they have rooted deeply into the soil, and they produce an immense quantity of blossoms. Next to the single blue, the single red is the most striking. I find this variety varies a little, probably because seminal varieties; one that I have is of very fine form—a clear bright rosy-pink hue. The single white variety varies also. I have one with stout well-formed flowers, and dark stamens, which affords a pleasing contrast.

All the seedlings from the single white I have raised myself, or have seen raised by others, are of indifferent form. When I was at Highfield Park, Heckfield, Hants, at Easter, I saw in the gardens there some clumps of the single white, and among them one of large size, stout, and well-formed; but Mr. Davidson was not quite certain whether this came among a number of seedlings he had raised, or not.

One may justifiably rave over the *Hepaticas*, for they are among the earliest and the prettiest of spring flowering hardy plants. I may state in reference to the outdoor clumps, I give them a top-dressing of good and rather fine soil just as they are coming into bloom, and add a little more when the seed-pods are formed, so that when the seeds are shed they may have something to root into. In the autumn I scatter a little litter over them, such as short dung and leaves, which serves as a useful winter protection. I also grow a number of plants in pots, and they are plunged to their rims in cinder-ashes on a north border, where they do very well. When winter approaches a layer of cocoa-fibre is laid over all, the advantage being that the frost is kept out of the pots to some extent, and I do not lose so many pots by breakage from frost as I used to. I find I get more seedlings from the plants in pots than I do from those in the open ground, the reason being, in all probability, that the position in which the outdoor plants are growing is a very hot

one, and the seeds shed on to the surface soil no doubt become quite roasted up during the summer.

For decorative purposes I decidedly prefer the single varieties. There is a refinement about them one does not get in the double types, of which, however, there are but two that I am acquainted with—the double red and the double blue. I have some difficulty in getting the latter to make much growth planted out with the others; perhaps cooler quarters are necessary. It does better in pots.

Hepaticas do best when planted in suitable places and let alone. Then when they become thoroughly established they grow into size. Frequent divisions of the roots are certain to occasion losses, unless the divided plants have tender treatment. I place the divided pieces round the sides of pots, and plunge them in the ash-bed, and in a year or two, according to their strength, pot them singly, taking care to have as much soil as possible adhering to the roots.

R. D.

FORESTRY.

ORNAMENTAL VARIETIES OF OAK.

QUEERC'S *CONCOMIA* for brightness of the decaying foliage—a beautiful golden tint—is excellent. For autumn effect this charming Oak can hardly be over-valued, the whole tree during the latter part of August being one mass of gold—a clear and bright yellow. Planted in close proximity to a Purple Beech, the effect is surprising.

Being but a form of the English Oak, grafting must be resorted to if the colour of the leafage is to be retained.

The Lucombe Oak (*Q. Lucombeana*) is a sub-evergreen tree, and a form of the well-known Turkey Oak (*Q. cerris*). It was raised fully a century ago at Exeter, and since that time has been extensively circulated, particularly on account of its rapidity of growth and ornamental nature. Generally the Lucombe Oak has an erect habit of growth, and both in young and old trees a pyramidal outline is noticeable while it is regularly furnished with branches. In many parts of the country large specimens of this Oak are to be found, and it is always a notable tree on account of its semi-evergreen habit—the leaves, when the winter is not too severe, being retained until the new ones are pushing forward.

The Fulham Oak (*Q. fulhamensis*) is another form of the Turkey Oak, and is, unless in the most typical specimens, hardly distinguishable from the Lucombe. The only real differences in habit are the Lucombe, as we have said, being semi-fastigate, while the present form branches widely, and has much less inclination to form a straight main stem. Grafting of this particular Oak must be resorted to if its distinct qualities are to be retained. The leaves in shape and size are a counterpart of those of the Lucombe form, and are also retained throughout the winter. It is a highly distinct and ornamental tree, of very free growth, and perfectly hardy in any part of Great Britain.

The cut-leaved Turkey Oak (*Q. cerris laciniata*) is perhaps the handsomest and most-to-be-desired of the many forms of this rather variable tree. In it the leaves are deeply and irregularly cut, which imparts to a goodly-sized specimen a very distinct and graceful appearance.

The variegated Turkey Oak (*Q. cerris variegata*) has its leaves margined with creamy-white, and as this is perfectly constant and on all the foliage, the tree may be described as one of the most ornamental of deciduous variegated hardwoods. *A. D. Webster.*

DESTRUCTION OF SHOOTS OF SPRUCE FIR.

I wrote you some time ago in regard to the destruction of the young shoots of the Picea Smithiana in the Policies of Cullen House. I, however, received no answer in regard to the depredations complained of, and no enlightenment as to the cause. Since then, however, I have been vigilant almost day and night, and have at last been rewarded for my labour by discovering the depredator in the common starling. Simultaneously with that discovery, however, I am concerned to find the Silver Firs in the neighbourhood shorn of their year's shoots. Under two Silver Firs of about seventy years' growth, and from 50 to 100 feet in height, the small twigs completely cover the ground

beneath, so that basketfuls of them could be raked up. The shoots are severed as cleanly as if cut through with a scissors or knife, and are generally about 2 inches in length. To say that I have actually seen the starlings employed on this destructive work would be an over statement, but I am so far able to connect them with it as to leave no doubt in my own mind as to their identity with the depredators. They are the only birds of sufficient size or numbers in the district to be at all likely to do the mischief. They inhabit the injured trees daily, and congregate in them, especially in the morning. On approaching the trees the birds fly off, and thus it is that so far I have been unable to see them actually nipping off the twigs, which I hope, however, by adopting some mode of concealment to be able to do. The starling till within the last twenty years was a comparatively rare bird in this part of the country, and various were the means adopted to encourage them to breed hereabouts. The case is now, however, changed, and the starling is by far the most plentiful species of bird. Looking at the future by the light of the injury done to the trees, one is prompted to ask what means may be adopted to prevent the loss. One method thought of is the use of bird-lime at the mouth of the holes in which they make their nests; but as this can only be done during a limited period of the year, the gun must be brought to our aid. It is to be hoped that this starling pest may be rare in other places, otherwise we may not only hear of these two species of trees suffering but of others being similarly affected. *C. J. Michie, Cullen House.*

THE CORK OAK (QUERCUS SUGER).—How is it that we so seldom meet with this curious and withal handsome tree? Is it that it is considered too tender for our climate generally, or that it is not sufficiently ornamental to merit attention? As regards hardihood, we may say that, having seen it flourishing in several places from Carnarvonshire southwards to Kent, and in the latter place attaining to large dimensions, and likewise never having known it to suffer from the effects of even the coldest winters, its capabilities of withstanding the rigors of an English winter are pretty conclusive. That it is an ornamental tree few who have seen even a fair-sized specimen will care to deny; the sombre evergreen leaves, and deeply furrowed ashy-grey bark, being as unusual as they are interesting. Unless it be the evergreen Oak (*Q. Ilex*), few trees or shrubs have the same stiff and brightly green foliage as the Cork Oaks. Perhaps it is wrong to say brightly green, for there is a sombreness attached to the shining appearance that renders description a not at all easy matter. There are two handsome specimens of the Cork Oak growing on the lawn in front of Holwood House, in Kent, the largest of which girths 7 feet 5 inches at 2 feet from the ground, and has a spread of branches covering 42 feet in diameter.

Judging from the growth of this tree in several districts and in a variety of soils, we should say that it succeeds best in a gravelly loam, and where sunshine is freely admitted; it also grows well within the influence of the sea, as may be seen at Rhianfa, on the Meai Straits. *A. D. W.*

PLANTS AND THEIR CULTURE.

AQUATIC PLANTS.—These are usually regarded with much interest by visitors to gardens. Where they are grown apart from this, a representative collection is worthy of a place in any garden where the plants can be accommodated. Their characteristic modes of growth, and distinct habit form a relief from the monotony of habit of growth observed in other plants; and where there is an aquatic house their cultivation is much simplified. A choice collection may nevertheless be grown by putting the water tanks in other houses to this use, when these are in such a position as to command a large share of light. Should this not be the case, suitable small neat tanks could be arranged in any light place. Cement or wood are the best materials for the tanks. Indeed we know of a garden where a good collection is grown in barrels sawn in half, and where *Nymphaeas* and *Nelumbiums* regularly flower. These last-named plants, and *Eichornea azurea*, *Vallisneria spiralis*, *Limncharis Plumieri*, the *Sagittaria montevidensis*, should be potted in good loam and immersed in the water to the depth of a few inches; but the *Nymphaeas* grow better if there is a greater depth of water to grow in. There are also many small growing floating plants, viz., *Pistia stratiotes*

(the Water Lettuce), *Pontederia crassipes*, with its curious inflated petioles; *Trianea bogotensis*, *Salvinia natans*, *Marsilea* of sorts, *Azolla pinnata*, and *Myriophyllum proserpinacoides*: the last two are hardy in favoured situations, having lived outside in the ponds here and elsewhere in Surrey, during the winter of 1886-87, and no doubt they will again make their appearance on the water. These two last are the prettiest of floating aquatics.

It is very essential that the water in which aquatics grow should be kept sweet by frequent renewals, and the plants should be copiously syringed. The highest temperature allowed for the water is 75° with sunshine, and in water of this warmth the *Victoria regia* will thrive quite well. A suitable temperature for the aquatic-house is from 75°—80° during the day; do not use shading of any kind, and shut up the house early, while the sun is still on it, damping down thoroughly, and allowing the temperature to run up to 90°.

Primula sinensis.—A sowing of these should now be made, for early flowering; cover the seed lightly, as if it is exposed on the surface, as some advise, it is liable to be more affected by the fluctuations of heat and by dryness. A good plan is to plunge the seed pans in some moisture-holding material—sifted coal-ashes, spent tan-bark, or sawdust answer well—in a temperature of about 55°, with plenty of moisture. Under this treatment the seed takes a little longer to come up, but the seedlings are sturdier and get along faster afterwards than they would by using greater heat.

Platargoniums.—Specimens of the show and fancy section should have attention paid to staking out the shoots, and bringing them into the desired shape; for if this operation be delayed too long the leaves have not sufficient time to right themselves before the flowers begin to form, when growth becomes less active, and the operation is not so completely hidden. Decorative plants in 48's and 32's require little in the way of staking, the object being to keep the few shoots together so as to form a nice even head. Give plenty of air, as much light as possible, and weak liquid manure twice a week; periodical syringing with weak tobacco-water will keep down greenfly. *F. Ross, Pendell Court.*

THE FLOWER GARDEN.

WALKS AND CARRIAGE-DRIVES.—These should be kept scrupulously clean, and free from weeds at all times, even although it be at the expense of some less important matters. In some gardens it is customary in the spring to give them a light dressing of salt for the purpose of keeping down weeds, but this is a practice which cannot be recommended, for the simple reason that its effect is that of a manure to a certain extent, the weeds after a time appearing numerous. The best method of killing weeds that I am acquainted with is to water the walks with a solution of arsenic at the rate of 3 lb. to 40 gallons of water, and which should be boiled for 20 minutes before using it. The remedy is one that requires great caution in its use, and strict orders should be given to those employed in its preparation and use, to prevent any mishap. They should not inhale the steam from the mixture whilst boiling, or afterwards; they should also be careful not to allow any of it to come in contact with their boots and clothes; and lastly, all utensils must be thoroughly cleansed, and the men should wash their hands with a scrubbing-brush after the work is done, or before taking their meals. These directions may seem trivial, but the poisonous nature of the mixture obliges me to lay stress on them. After some few years' trial, I can confidently recommend the method to all who wish to have clean walks and carriage-drives without much labour or expense. Two applications in the course of the year will generally be found sufficient, viz., in spring and autumn. With grass and Box edgings boards should be placed against each side before watering, and the operator should walk backwards.

The Rockeries.—This part of the garden should be put in neat and trim order before the season gets further advanced. Cut off all fronds from Ferns, stir and cleanse the surface soil with a fork. *Primulas* will be benefited by a light top-dressing of leaf-soil, to which may be added a third part of sifted decayed stable manure. Many subjects growing on rockeries require severe cutting back to keep them within bounds, and this is best done now or in the autumn; indeed, some species require to be cut in three or four times during the summer

months, to prevent encroachment on their neighbours. Among these strong growers are *Ilitchinsia alpina*, *Antirrhinum pallida*, *Arenaria balearica*, *Herniaria glabra*, and many kinds of *Sedums* and *Saxifragas*. We do not mean that they should be cut so as to form small tufts; to do so would simply amount to robbing many species of half their characteristic beauty. Many of the *Sedums* and *Saxifragas*, for instance, are seen to the best advantage when they are growing in large patches of half a yard across, but whatever space is allotted to a plant, whether it be 6 inches or more, it ought not to be allowed to extend beyond these limits. The present time is also opportune for cleaning the stones in the rockery, and freeing them from lichens and mosses, where such are objected to. Personally, I think their presence on rockeries not objectionable, and never of my own choice destroy them. The whole matter, however, is one of taste, and had better be treated as such.

Herbaceous Borders.—Tidy the Dutch hoe freely on these to keep down weeds, and rake over the surface to give a neat and clean appearance. Keep a vigilant outlook for slugs amongst young plants and all choice subjects, as it usually will happen that these are the first to be attacked. Beyond this little will require to be done on herbaceous beds and borders until the plants have sufficiently advanced in growth as to render staking and tying necessary, and watering the spring planted stuff when it becomes necessary.

Miscellaneous.—Cut back Ivy growing on walls or other buildings if necessary. Neglected plants contain usually a superabundance of breastwood; and there need be no hesitation about cutting it in close to the wall, as it will soon make a presentable appearance with its new foliage. The majority of half-hardy bedding-out plants should now be put out-of-doors in frames, or other temporary shelter, to get gradually hardened off. Give ventilation on all favourable occasions, removing the lights entirely as soon as it is safe to do so. Remove to nursery quarters, or to the reserve garden, all evergreen shrubs that have served the purpose of temporary embellishment of the flower-beds, and prepare these beds forthwith for their summer occupants. *J. Horsfield, Heytesbury.*

THE HARDY FRUIT GARDEN.

WATERING APRICOT BORDERS.—The weather, having proved all that could be desired in this district during the time the trees were in bloom, has resulted in a heavy set of fruit, so that there will be much to thin off at a later period. Where there has been little or no rain, it will be advisable to give the borders a good soaking of water, and if the drainage of the border is in proper condition nothing but good will result. It will be necessary, where the fruit tree alleys are rendered compact, and impervious to water by the trampling caused in attending to the blinds, to prick up the surface before watering. After watering, the alleys may be mulched with long manure, preferably that from the cow-stalls. This is the best kind of manure for Apricot trees, and I can confidently recommend its use. Special attention will have to be given in dry districts to all fruit tree borders this spring, for although there were heavy falls of snow during the winter the thaws generally have not been accompanied with rain, so that the borders have not received a thorough moistening for a long period of time, and unless heavy rains should ensue before long, a great deal of labour will have to be expended in artificial watering. Keep a sharp look-out for the Apricot maggot, which shows itself by the leaves having a rolled and twisted appearance. The surest method of destroying these troublesome depredators is by pinching the leaf between the finger and thumb. After this date the blinds need only to be used on cold nights, when they will act as a protection to the tender foliage. *A. Ward, Stoke Elith Gardens, Hereford.*

THE LINNEAN SOCIETY.—At the meeting of this Society to be held on May 3, at 8 p.m., the following papers will be read:—1, "Researches into the Life-histories of *Glyciphagus domesticus* and *G. spiniper*," by A. D. Michael, F.L.S.; 2, "Note on Root-pressure," by C. B. Clarke, F.L.S.; 3, "On Ovicells of some Lichenopora, &c.," by Arthur W. Waters, F.L.S.

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

Imported Orchids, at Protheroe & Morris' Rooms.

Schools of Horticulture.

If the race is to the swift and victory with the strong, it is equally true that commercial success and the highest amount of financial prosperity will be reaped by the best and most appropriately trained people. It is as true of work of all sorts as of other things, that ignorance is weakness, if not worthlessness. Knowledge is power, that is, value in buying, selling, producing, conveyancing, as well as in literature, art, politics, science, philosophy. The superior education of the well educated German, French, Belgian, and Danish gardener endows him with the power of obtaining better work and higher wages than the less educated Britisher. Through systematic education in schools of horticulture for periods of two or three years lays the best possible foundation for the acquisition of fuller and higher knowledge; it will also give a death-blow to one of our most mischievous fallacies, seldom heard on the Continent, viz., that a little knowledge is a dangerous thing. As if the little were not only the very best but the only possible way of converting the little into much. Granting that the systematic knowledge taught in schools of horticulture may be little, this germ may, by natural force of evolution, broaden and expand till it covers the entire field of knowledge. If these schools did little more or better than establish habits of sustained and systematic thinking they would confer an enormous advantage on the youths that pass through them. For this art thoroughly formed can never be wholly lost. Every day's additional experience but the

more firmly establishes the truth, that the value of all but the merest mechanical work is but the measure of the thought put into it. And this is as true of the worker as of the profound thinker. In fact, this distinction can hardly be sustained, for well-directed thought and profitable work are virtually synonymous terms. Hence the absurdity of the prejudice against educated gardeners not being practical, and the impression that they have not much work in them. If they are really suitably trained, the very converse of this is true. The scamped work, the starveling products, all too common in horticulture as in other departments of our national industries, are not the results of education, but the sure and irrefragable proofs of the lack of it. Never was the cry more loud and urgent than now, from almost every field of British industry, for higher general, special, or technical education, to enhance the power of the workers and the value of their products.

Mere plodding perseverance—physical force—may suffice to pick oakum, break stones, lift, drag, or push heavy weights, but such forces are totally inadequate either to dig, sow, or mow, propagate, prune, pot, and water plants, or skillfully foster the profitable culture of either fruits, flowers, or vegetables. And yet these are but the A. B. C. of horticulture. Without dwelling on its higher branches, such as botany, vegetable physiology, and the relations of plant-life and products to light, heat, earth and water, electricity, chemistry, &c., it is only needful to glance at the decorative side of horticulture to see what illimitable scope it furnishes for the loftiest thought, and the most cultured taste.

Not a few of our landscapes are already very beautiful, and doubtless the garden-artists of the future will aspire to combine the happiest conceptions of poets and painters, and their bolder and more emphatic expression in living forms and more exquisite colours in our gardens. But to reach to such heights of cultured taste, or, indeed, hold our own in the severe commercial and monetary competition to which we are now exposed, a higher general technical and practical education is needed.

In regard to many of our horticultural products our climate is against us. It would be the height of folly, and sure to bring about failure, to handicap ourselves with ignorance in addition. This we seem in imminent danger of doing; for not only have we no national schools of horticulture, but the thirst for knowledge and the practice of self-improvement are on the wane.

The cry of young gardeners some twenty or more years ago was for improvement. Is it or is it not true, that for that brave cry, amusement has been very generally substituted? If so, possibly this ominous fact may account for the only partial success of the few tentative schemes that have been put forth at Sydenham and Chiswick to forward the higher education of horticulturists. It is to be hoped that this sphere of labour will not be overlooked in the many plans on foot for the reconstruction and resuscitation of the Royal Horticultural Society.

It is never too late to mend, and it is hoped that the reconstructed Society will prove one of the best teachers of horticulture alike to horticulturists and the nation. It is only by such means that we can expect to hold our own in the keen competition of products we are already engaged in, and in that coming competition with the living German, Belgian, French, and Danish gardeners, who, if wiser and better than the home article, are sure to come over in increasing numbers.

Looking at the manufacturing forces employed

for the turning out of fully equipped, well educated foreign gardeners, and to the other fact that we have virtually nothing to oppose to all this well-organised machinery, the outlook for our young men is anything but cheerful. As we stated some time since, there are thirty-three horticultural schools in Germany alone, two in Belgium, one or more in France (one only with a President and nine Professors, forty scholars taught free for three years), and others in Denmark—let no one say that these are mainly for the teaching of propagation and the nicer knife manipulations of horticulture. Why, on the next page (178) it was announced that a Landscape Gardening Committee had just been added to the National Horticultural Society of France, of which M. CH. JOLY—to whose courtesy and kindness so many English gardeners visiting Paris are much indebted—is the able and indefatigable Vice-President.

Whatever it may have been in the past, it is shown that in the future no department and no product of horticulture will be free from the strain of foreign competition. Now the only sure and certain means of their holding their own in the contest is that they start as even as possible in the mental, moral, and physical equipment. With that equality of power that equivalence of knowledge confers, no one need fear for the future of our horticulture or horticulturists. But higher or more thorough education must be obtained; and if neither the Government nor our public societies will move in the matter, it is the more incumbent on every young gardener to become a school or schoolmaster to himself, and thus do his best to solve the knot of foreign competition by his higher culture and self-improvement.

PHALÆNOPSIS SCHILLERIANA.—The accompanying illustration (fig. 72), is taken from a photograph of plants in the collection of FRED SCROLES, Esq., of Brooklyn, New York, who has been called the PARTINGTON of America—a compliment that is richly deserved as our engraving undeniably proves. The two plants here depicted are fair representative examples (one being 3 feet in height), and only three years since were very small pieces. Mr. SCROLES is very liberal in the use of cow-manure in liquid form when his plants are making active growth. That he has practically demonstrated the efficacy of his treatment is proved by the luxuriance both in foliage and flowers of his Phalænopsis, one plant in his collection having no less than fourteen leaves from 8 to 15 inches long, and of remarkable substance. This plant carried three large branching spikes, and when in flower would be a marvel of beauty.

THE ROYAL HORTICULTURAL SOCIETY.—It is very satisfactory to note during the last week (1), that not only was there a good show—for that there has been any time for the last three years—but that there was a good gathering to see it; (2), that "Covent Garden" has been enlisted in its support; and (3), that the members of the Auricula Society have shown a sense of loyalty not too conspicuous in other quarters. As the national representative of all sections of the horticultural community the Royal Horticultural Society has a great future before it if it will only see that its duties and responsibilities are not confined, as heretofore, to one or two channels only. Hence we are particularly glad to have to record the presence at both the meetings we have alluded to of the President and some members of the Council of the Society.

SUCCESSOR TO MR. WOODBRIDGE.—We believe the question of a successor to Mr. WOODBRIDGE on the Council of the Society is under consideration. There are several competent men, if they could be induced to act, and, in truth, we want, not one practical gardener only, but many, on the Council; and,

FIG. 72.—*PHALANOPSIS SCHILLERIANA*, REDUCED. (SEE P. 528.)

moreover, they should be elected in consequence, if not in form, by their fellow gardeners—being subscribers, of course. In future we hope no good gardener, who is able to do so, will fail to become a supporter of, and an active worker in the Society. If the Society in future fail in its duty to the gardeners, it will be their own fault.

THE EXHIBITION IN THE INNER TEMPLE.—As previously announced, an exhibition of Orchids, Azaleas, &c., will be held in the grounds of the Inner Temple, on Thursday, May 17 next, under the patronage of the Lord Mayor. The Council has decided to offer £100 in prizes which are not specified in the schedule (now before us), but awards will be made according to the merits of the exhibits at the discretion of the judges. There are twenty-four classes, six of which are devoted to Orchids. One class for a group of plants, arranged for effect in 150 square feet, is open only to market growers. Great variety is shown in the schedule, and if well taken up by exhibitors, the show is likely to be a success.

"KEW BULLETIN."—The April number of this periodical has, to use the slang of the day, inaugurated a new departure. Since the discontinuance of Dr. Hoog's *Year Book* there has been no complete list of new garden plants published in this country. The Federation of the Belgian horticultural societies has published a full list up to a certain date in Belgium. In our own columns most if not all of the plants of the year are chronicled in each year; but since 1886 there has been no complete list in separate form issued. On this account we welcome the list now issued from Kew, and trust it may be perennial. Of course it is not to be expected that the Kew authorities are to be held responsible for the correctness of the nomenclature of which they furnish a record. The list is arranged alphabetically, but we would suggest that in another issue the names of the plants be not only given in alphabetical sequence, but that a list of the genera mentioned be also given ranged under their respective natural orders.

COLOGNE INTERNATIONAL HORTICULTURAL EXHIBITION.—This exhibition is announced to take place from August 4 to September 9, in celebration of the twenty-fifth anniversary of the establishment of the Flora Society. The subjects of exhibition are the following:—Plants of various categories, horticultural products and appliances, tools, &c., together with bee-culture, and literature. There are in all 750 classes in the schedule, with medals to correspond. Dr. P. Essea, Cologne, is the Secretary.

BRUSSELS EXHIBITION.—We have received the programme of this International Exhibition, which will remain open from May till October. So far as the Horticultural Exhibition is concerned, the programme comprises a permanent exhibition in the gardens, including trees and shrubs, isolated and in groups, hardy plants, bulbs, annuals, &c. On July 1 and 2 a special exhibition of Roses will be held. On August 11 and 12, bees and their products will receive attention. From August 19 to 23 a general horticultural exhibition will be held. From September 30 to October 2 there will be an exhibition of fruits and vegetables, together with Dahlias and autumn flowers. Those who are desirous of further information on the subject should address themselves to M. Lennens, Botanic Gardens, Brussels.

THE HARDHOOD OF FRUIT BLOSSOMS.—We publish the following communication with the hope of directing to it the particular attention of fruit growers—that is to say of all who grow hardy outdoor fruits—Apples, Pears, Cherries, and Plums. The writer of the letter in question has for many years past taken much interest in the cultivation of these fruits, and the purpose he has in view in asking for the information specified in his letter is either to confirm or upset a theory he has had forced on his mind as to the steps it is necessary to take if hardy

fruit growing in this country is to be placed on a more satisfactory footing than it at present can be said to have. We feel justified in saying that all who may respond to our correspondent's request—and we trust that many who read these lines will do so—will help an honest endeavour to confer a great public benefit:—

"To FRUIT GROWERS.—I shall be much obliged for information on the following points, and I make my request known at this particular time in the hope of inducing fruit farmers, amateur fruit growers, and gardeners to carefully observe and accurately note during the present season—

"1. The dates of blooming of the various kinds of Apples, Pears, Cherries, and Plums under their care, of which they know the correct names, for on accuracy of names much of the value of the observations will depend.

"2. The dates on which frosts occur during the blooming period, the degrees of severity and duration of such frosts, and their effect on the blossom of trees respecting which observations may be recorded.

"3. The crops borne this year by the several trees under observation.

"4. What varieties of the above-named fruits are least affected by the spring frosts.

"5. What varieties are most injuriously affected by the frosts.

"6. Whether the early or late bloomers bear the best crops of fruit this year.

"Any one who has made notes on these points, or any of them, in previous years, and will communicate them to me, will lay me under a great obligation.

"I am collecting this information for the purpose of testing a theory I have formulated on the subject of hardy fruit growing in this country, and I shall publish it in this journal as soon as I am able to collate the several answers I may receive.

"Gentlemen who may favour me with answers to the above questions will please state the exact locality where their observations are made, and if they are able to give precise information as to the crops borne in former years by the trees under observation this year the information will be most acceptable. Edward W. Bidger, Moseley, near Birmingham."

PHŒNIX CANARIENSIS.—This noble Palm, which may be seen in such profusion in the Ghent nurseries, is, according to M. André, in the *Revue Horticole*, a true native of the Canary Islands. It is a Palm which thrives well along the Riviera, producing a very short thick stem and a dense tuft of pinnate, arching leaves, each attaining a length of 9 or 10 feet. The inflorescence is like that of the common Date Palm, and the golden-yellow flowers are succeeded by small acoro-like yellow drupes. It is one of the handsomest Palms for conservatory decoration.

SPECIAL SOCIETIES.—Those who are interested in the progress of horticulture will see with pleasure that the Primula Society has again held its show under the auspices of the parent society. Specialisation is said to be one of the tendencies of the age, and so no doubt it is from the operation of the law of subdivision of labour, but care should be taken not to carry this so far as to create danger of a race of quacks usurping the position really due to the Faculty. If the members of the special societies would contribute their quota to the parent society, and secure representation on its Council, or (as the charter may stand in the way of that) on the general committee of advice, a sufficient income might be accorded to the parent society, while the requirements of specialists might be met by means of special prizes and special committees. Under existing circumstances we must remind specialists, who are not members of the parent society, that their position is rather anomalous and their patriotism weak.

STATUE TO PARMENTIER.—In the town of Neuilly a statue has been erected in the memory of PARMENTIER, who was the first to introduce the culture of the Potato into France. Such are the differences in national characteristics that we suspect a similar proposal here would be met with ridicule, and even those who introduced Cinchona

into India are not likely to be honoured in this fashion.

COLLEGE OF AGRICULTURE, DOWNTON, SALISBURY.—The winter session ended Thursday, April 19. The Certificate of Membership and the Certificate of Proficiency in Practical Agriculture were awarded to Mr. A. W. C. Bower, Broxholme, Scarborough; Mr. D. W. Collyer, Craig Nethan, Weston-super-Mare; Mr. C. E. M. Desborough, Headington, Oxon; Mr. F. O. Solomon, Southfield House, Dartford; and Mr. W. A. Watson, B.A., 65, Eccleston Square, London, W. The Certificate of Proficiency was granted to Mr. J. B. Fielding, Stapleton Rectory, Shrewsbury; Mr. R. F. Grimes, Fern Bank, Balham Hill, S.W.; and Mr. Crofton Kent, Rippington, Sevenoaks. The Scholarship, offered amongst first-year students, was won by Mr. P. C. Burton, 43, Mount Park Crescent, Ealing. Prizes, either in class subjects or in practical competitions, were awarded to Mr. W. H. Carver, Polefield House, Prestwick; Mr. A. H. Douglas, 15, Albyn Terrace, Aberdeen; Mr. V. S. Galsworthy, 11, Waterloo Place, Pall Mall, S.W.; Mr. W. E. Genge, Waterston House, Dorchester; Mr. A. G. Lascelles, Sion Hill, Thirsk, Yorkshire; Mr. T. G. Leatham, Hemsworth Hall, Pontefract; Mr. W. D. Linsell, Bevors Hill, Southampton; Mr. W. Montgomery, Careysville, Fermooy, Co. Cork; Mr. F. Turchin, Kennet House, Newberry, Berks. The external examiners in practical agriculture were Mr. Joseph Carpenter, Barcomb, Salisbury, and Mr. William Stratton, Kingston Deverill, Warminster.

THE FRUIT GROWERS AND THE SALESMEN.—There has been some amount of complaint recently on the part of the Hampshire fruit growers, more especially in reference to the salesmen's commission rates. It appears from a circular addressed to these fruit growers by Mr. J. B. Thomas, Covent Garden Market, and now before us, that he, a salesman charging a commission at the rate of 10 per cent., can not afford to supply the growers with empties in which to pack their goods because the latter do not look after his property but allow it to be converted into all sorts of uses other than those for which it was intended. Hence has arisen of late a disinclination on his part, and doubtless on that of other salesmen, to look after the interests of the growers; but he now comes forward with new offers, viz., 1st, a 10 per cent. commission, to cover the loan of boxes, market tolls, portorage, and guarantee, all boxes supplied, those not returned being paid for; 2nd, a 5 per cent. commission, besides a market toll of 2d., portorage 1d., the senders to provide their own boxes.

THE SCOTTISH PRIMULA AND AURICULA SOCIETY.—It is the intention of the above Society to hold a show of Primulas and Auriculas in the Calton Convening Rooms, Waterloo Place, Edinburgh, on Wednesday, May 9 next.

ORCHID AND OTHER PEAT.—Some excellent samples of peat have been forwarded to us by Messrs. Eves & Co., Ringwood. In many parts of England good peat for Orchids and hard-wood plants is difficult to procure, but in the neighbourhood of the New Forest there are still large deposits upon which gardeners in the future may rely.

MARCH AT THE ANTIPODES.—As showing what our countrymen grow on the other side of the globe, and how they proceed with garden operations, the following directions for the flower gardener are culled from the *Mildura Irrigationist and Murray River Agricultural Times* for March 7 last:—

"Free sowings of all sorts of hardy annuals should now be made in seed-boxes or pans, to be afterwards planted out. In the meantime the beds may be prepared for their reception by thoroughly turning over the manuring. The beds should also be kept moist; so that all seeds of weeds may germinate and be destroyed as they appear above the surface. Roses which were not budded last month may still be treated so long as the bark separates freely from the

wood. Many herbaceous plants, such as Primroses, Polyanthus, Daisies, and others may now be lifted and replanted, and cuttings of Verbenas, Pentstemons, Antirrhinums, and others, should be put in sheltered positions. Remove the young rooted plants of Carnations which have been layered and transplant into beds; layering may still be done if required. Take up Dahlias and Gladioli that have finished flowering as soon as the stalks have withered, and store in a warm dry shed or cellar. Sowings may be made of Pansies as well as Primulas, Cinerarias, Calceolarias, and Mimulus. They should be sown in seed-pans in fine rich soil, in a sheltered position, and may be pricked out as soon as the seedlings are sufficiently advanced to bear handling. French Poppies must be sown where they will be wanted, as they will not bear transplantation. Evergreen shrubs should be overhauled and trimmed into a sightly shape. No attempt should be made to give them a fixed or uniform shape, but straggling branches and dead wood should be cut out."

FRUIT EXHIBITION IN VIENNA.—The Fruit Society of Lower Austria has determined to hold an exhibition of fruits in the autumn, on the occasion of the Jubilee of the Emperor. The exhibition has for its purpose the placing before fruit-growers, fruit farmers, and the public, the newest technical discoveries for turning fruit to account; and will divide the various exhibits into four classes—1, Table and market-fruits; 2, fruit-preservation, in conjunction with a fruit-drying competition; 3, a fruit market; 4, fruit trees, and appliances for growing fruit (nursery goods). The classes 2 and 3 are international.

COMING SHOWS.—Kettering and District Horticultural Society will hold its fourth annual show on "Feast Monday," July 2, when handsome prizes are offered for groups of plants, cut Roses, vegetables, &c. The annual exhibition of Chrysanthemums will take place on November 17. The Stratford, Forest Gate, and Ilford Horticultural Society intend to hold a show in Cranbrook Park, Ilford, on Thursday and Friday, June 28 and 29 next, in connection with the Essex Agricultural Society.

THE APIARY.

BEES may now be overhauled if necessary, but let this be done cautiously or the brood may be chilled. As for myself I shall wait a little, as during the last few days the bees have been vigorously carrying pollen into the hive—a sign that all is well with the queen; but as bees are now breeding fast, and therefore consuming a great deal of food, take care they have it, and if they are taking in pollen it is far better to feed gently than overhaul them. Remember that more bees die in April than during the winter. If you begin to feed, keep on feeding until the honey season. Better never feed at all than begin and leave off too soon.

Should bees be listless, something has probably happened to the queen, and, in this case, thoroughly examine the hive. If the queen be dead join the bees to another hive at once. If from any cause the bees in the hive have dwindled away, do the same thing, *i.e.*, join them to another stock at once.

The time will shortly arrive for intending bee-keepers to buy swarms. First swarms are the best to buy, and endeavour to buy a first swarm from a hive which swarmed last year; thus you will have a fertilised queen aged one year, and this will be a great advantage, as the second year is the best. Swarms may be bought of a neighbour, but if you should make up your mind to buy stocks, then purchase them from somebody who lives at least two miles off, or the bees will fly back again.

Get ready all appliances and order everything you want, or by-and-by you may be left in the lurch. If your bees are near a stream you need not give them any water, but if not give them some at once. Wet tea leaves or cork dust completely covering the surface of a pan of water are two very simple and effectual methods. *Dec.*

HOME CORRESPONDENCE.

ROYAL HORTICULTURAL SOCIETY.—I fully endorse what your correspondent, "F. R.," says on p. 498 as to the hour of meeting. The present one, viz., 11 o'clock, is very inconvenient to any Fellow or exhibitor living more than 100 miles from London. He must either come up the night before, thus doubling his expenses, or he must leave home soon after 4 A.M. A man must have a great love for horticulture to do this! The success of all undertakings, whether public or private, depend largely, nay, chiefly, on the care bestowed on details, and if the Council wishes the Royal Horticultural Society to succeed, it must not think any practical detail below its notice. Either they wish country members to exhibit and attend or they do not. If the former, they will take all possible steps to make everything as convenient as possible to them. Our Council is, I am sure, amongst the most ardent supporters of the old Society: would they personally like to have to rise at 4, 5, or even 6 A.M. every time they attended a meeting? *Henry J. Pearson.*

LARIX PENDULA.—In reply to the remarks of Sir C. W. Strickland, p. 469, I am pleased to make known to your readers all the information which I possess about the tree figured (see Supplement, April 7). The plant was bought with other weeping Larches some thirty years ago, and is, I think, a sport from *L. europæa*, but if it be a seedling variant, or a sportive form of the species perpetuated by grafting, I know not. I do not suppose it to be identical with the variety of the weeping Larch mentioned by Loudon as growing at Dunkeld, as it does not form an erect leader, or show any inclination to make one. *Maurice Young.*

FRUIT RATES OF TRANSIT, &C. (SOUTH HANTS).—"Spade's" remarks under the above heading (p. 499 of your last issue), and more especially his figures, are exaggerated, or he has not properly mastered his facts. The rate of salesmen's commission is 5 per cent., exclusive of market tolls, not "12½ per cent.," railway charges are 25s. per ton, or 2½ per cent., not "7½ per cent.," on the estimated value of "£51 per ton." The total is £3 15s., not £10 per ton expenses. The charge for a single box, even by passenger train, is only 1s. 3d. for 56 lb., not "2s.," and I venture to think that consignors of less weight than 56 lb. are not worth the consideration of an association. An appointed agent who is a stranger to the trade, the market, and the buyers is, as a sales man, likely to lose in the prices realized more than double the usual commission of a London salesman who does not labour under these disadvantages. *J. B. Thomas.*

THE LATE MR. WOODBRIDGE.—It is, perhaps, a propitious moment for a suggestion with respect to the perpetuation of the memory of one whom we shall indeed miss; Mr. Woodbridge held strong views concerning the education and professional advancement of young gardeners, and which he earnestly hoped his novel, yet eminently appropriate position, as a member of the Council of the Royal Horticultural Society would enable him to put into practical shape. The suggestion is, that the gardeners and horticulturists of the kingdom be invited to contribute to a memorial which would take the shape of one or more annual prizes to be awarded to candidates who should the most efficiently pass such examination in practical and theoretical horticulture, as may be thought desirable by the Council of the Royal Horticultural Society. If such a memorial to a leading gardener, one of the most eminent men in the profession, and who in life has recently been specially honoured because of his singular fitness, could be established, it should, like that raised to the memory of the late Charles Turner, be terminable, say in ten years, the sum raised being so apportioned that it would furnish some one or two desirable prizes annually for that number of years. It was my fortune to have had a very recent conversation with our lamented friend concerning the subject he had so much at heart, for no longer ago than March 31 he called here when passing, and fully detailed his views, and that, too, with much earnestness. His mind was specially set upon the promotion of some form of examination through which the young gardeners of the country might rise to higher things, although, so far, that height in relation to honours

had not gone beyond that of Associateship with the Royal Horticultural Society. Mr. Woodbridge, in response to the suggested difficulty with respect to conducting examinations because of the widespread and yet isolated habitations of gardeners generally, thought that, whilst a series of questions might be set of an uniform character for the entire kingdom, which might be replied to on given days or evenings, and within a prescribed time, the actual supervision of that time and work of replying might well be left to the various head gardeners, most of whom, he thought, could be fully trusted to carry out faithfully the instructions sent with the examination-papers. In cases where other young men, not connected with large gardens, wished to be examined in the same way, it was thought that arrangements locally with various head gardeners [who, in the future, it is hoped, will become Local Secretaries of the Society, *Ed.*] could easily be made to that end. All the local work of the Society of Arts, and the Science and Art Department examinations in many subjects, are conducted through the instrumentality of one or two persons, and the same could easily be done through the various local head gardeners. It was also Mr. Woodbridge's belief that numerous employers of gardeners would be not only induced to take active interest in this educational movement, but would render help and encouragement also. Very distinctly did he declare that it was in no way wished to set up any educational tests for the gardeners of mature years. Such men have already won their status in the profession, and to place them in leading-strings now would be intolerable. It was rather to the growing generation of gardeners the tests were to be applied, not only with the object of giving young practical gardeners an improved professional status, but also that young men might be induced to see fairly early in life how far their knowledge, both theoretical and practical, had fitted them for the ranks of gardeners. That the supply of young gardeners considerably exceeds the demand there can be no doubt, and Mr. Woodbridge hoped that with some form of educational test in the elements of gardening, considerable weeding out would be accomplished, as those who failed would, after a second or third year's trial, probably find that they had, in entering gardening, mistaken their vocation. I think the detailing of these facts—dry, perhaps, but clear and precise—will tend to show that Mr. Woodbridge, in becoming a member of the Council of the Royal Horticultural Society, had in no way become inflated or impractical in his ideas. I am sure that in accepting such a position, our deceased friend had only one desire, and that was to do something beneficial for gardeners and for horticulture. The same genial warmth of expression and of thorough honest friendliness continued to animate him, just as those social features had marked his character from the first. He was always kind, courteous, and considerate, as well as genial, and found a host of friends in every direction. Whenever it was my good fortune to have him for a fellow judge I always found him to be specially anxious to do that which was right, his work being performed with exceeding conscientiousness. In one case, when in judging he had reflected critically upon the culture of some plants before him, he was afterwards intensely annoyed to find the gardener's employer when the plants were under consideration, had, with great impropriety, stood at the judge's elbows, and expressed himself with exceeding indignation later. This was but one of many instances which might be produced to show how strongly his soul rebelled against anything unfair or dishonest, whilst his sympathies were ever with the class of which he formed so admirable an example. *A. D., Bedford.*

FOLIATION OF TREES.—For some years past I have made a practice of watching the Lime avenue here, and noting the opening and falling of its leaves. I send you the result below. It shows a great uniformity in the fall, not varying in the twelve years recorded more than twelve days, save in one instance of 1887, which, owing to the exceptionally dry summer, shows sixteen days as the extreme limit of variation. In the opening of the leaves a much greater divergence is observable, nearly a month occurring between the earliest and the latest date. May not this be owing to the much greater climatic variation, both in temperature and moisture, that characterises our English spring, than that which ever prevails in the autumn? Cold and dryness seem the influences most adverse to the opening of the buds, while wind is generally the cause of their early

destruction in the autumn. In the exceptional year of 1887, a long hot summer drought caused their fall so soon. It is difficult to note the exact day of these silent operations of Nature, or to fix them, but I think they are fairly correct, and they relate to the same trees throughout. As to the order of Mr. Marsham's observations, on comparing them with some of mine, I can only add that here in

1877. I noted Hawthorn blossom only fully out by June 10.

1879. I heard the cuckoo on April 7; and that the Beech was not in leaf on May 16.

1880. The thrush was singing delightfully from December 2, the weather being extremely mild.

Fall of the Leaves.

1874. October 31.—Lime avenue to-day quite bare of leaves; Hornbeams still covered—like globes of gold.

1875. November 7.—Limes bare of leaves only to-day; on October 31 still clothed with thin yellow leaves—fully a week later than last year.

1876. November 10.—All off by November 10 or 12, although they began to fall on October 15, and were falling fast on November 5.

1877. October 28.—Quite bare on October 28, and nearly so on 21st. A storm of wind on the 14th made great havoc with them, and on the first week in September a severe frost.

1878. November 8.—Leaves all off; almost so on the 1st.

1879. November 7.—Gone about this time; falling during the last three weeks of October, and about two-thirds off on November 2.

1880. November 2.—All the Lime leaves gone.

1881. October 30.—Limes quite bare; the storm of the 14th hastened their fall.

1882. October 28.—Limes bare of leaves; heavy winds prevailing; a dry spring and wet autumn.

1883. November 8.—Bare; on October 27 not more than half off, although they began to fall in middle of September, the summer being dry.

1884. November 5.—Quite bare; almost so on October 31.

1885. } Records mislaid.

1886. }
1887. October 23.—Leaves all off; half gone by the 16th; more than a week earlier than usual from the summer drought and heat.

Opening of Leaves.

1874. May 1.—Lime leaves coming out only now since the rain; the weather for a month or six weeks remarkably dry and cold.

1875. April 28.—Limes just opening and showing green.

1876. April 20.—Limes just coming into leaf; weather cold, but for some time showery.

1877. May 7.—Lime leaves just appearing by the 13th, only the lower branches showing green.

1878. April 20.—Leaves beginning to come out; quite green on May 1. A mild spring and a very wet April, May, and June. Good crop of grass.

1879. May 4.—Limes just opening—not more than half out on the 18th. A cold spring, April 13 (Easter Sunday) ground covered with snow, and in first week of May every one wearing his great coat as though it were Christmas.

1880. April 10.—Limes just now beginning to show green leaves. Dry spring till April came in showery.

1881. Records mislaid.

1882. April 9.—Limes opening their leaves in places. A mild, beautiful winter here.

1883. May 3.—Limes beginning to show their leaves, but yet hardly looking green; dry cold weather during March and greater part of April kept vegetation stationary.

1884. April 12.—A few leaves beginning to show, looking quite green by May 5, but not covered fully till 17th. Early spring very mild, but late spring very cold.

1885. April 25.—Leaves showing; quite green on 29th, and in full leaf only on May 17. A late spring.

1886. Records mislaid.

1887. May 7.—Leaves just appearing, but hardly perceptible; a dry spring and backward season, but little rain till last week.

1888. April 12.—Not a leaf out yet. *G. M. H., Bagshot Sands.*

LOMARIAS.—There are two of the Lomarias mentioned on p. 429 of your issue of April 7, by "Pteris" (whose present address I do not know), about which I would like to offer a few suggestions. Lomaria discolor bipinnatifida, so named, is an exceedingly handsome Fern, and should by all means be correctly named. I send you herewith several fronds, viz., one of *L. falcata*, one barren frond of this species slightly but very definitely bipinnatifid, and a fertile frond from the same plant; two barren forms of the variety known as discolor bipinnatifida accompanied by a contracted and apparently but not really fertile frond from the same plant, and a barren and fertile frond of *L. discolor*. I think an examination and comparison of these fronds will show that the so-called *L. discolor bipinnatifida* is a variety of *falcata* and not of *discolor*, and is what may be called an improvement upon the slightly cut variety of *falcata*, of which a frond is sent. The colour, form of frond, and habit of growth show the bipinnatifida variety to be related to *falcata*, but very unlike *discolor*, and I offer the suggestion that it should be so far as possible spoken and written of and described as *L. falcata bipinnatifida*. I also send you a frond of the variety described as *L. gibba platyptera*, and would point out that the fructification is along the midrib of uncontracted pinnae, and would thus appear to be more correctly classed as a *Blechnum*. If I am not mistaken when Messrs. Veitch sent out this capital decorative Fern as *L. gibba platyptera* they had not seen it in fructification. I would venture to suggest that henceforth it should be known as *Blechnum platyptera*. *J. Birkenhead, Sale.* [Mr. J. G. Baker, Royal Gardens, Kew, to whom we forwarded the Fern fronds above mentioned, remarks as follows:—"I. Many of the Lomarias run into blechnoid forms, especially punctulata and volabile. The later German Fern systematists all unite Lomaria and Blechnum as one genus. This is evidently a blechnoid form of Lomaria gibba. We have exactly the same thing from Veitch laid into the Herbarium in 1869, and then labelled *L. gibba* var. *blechnoides*. 2. There are two varieties of *L. discolor*, viz., *nuda* and *falcata*. Mr. Birkenhead is quite right in referring this bipinnatifid monster to var. *falcata*. It quite agrees with Mueller's original specimens described. *Fragm.*, v. 121, and again by T. Moore, *Gard. Chron.*, 1877, ii., 488. *J. G. B.*"]

GROUPS OF CHRYSANTHEMUMS FOR COMPETITION.—The committee of the National Chrysanthemum Society are to be commended for permitting for the future a belt of Ferns and foliaged plants to be used as a margin to groups of Chrysanthemums in pots arranged for effect; and this edging need not trench upon the space set apart for the Chrysanthemums, as it can occupy an additional space provided it does not exceed a foot in width. These groups afford masses of brilliant and striking flowers of varied colour, but they are generally borne on plants grown on a single stem; and they are invariably tall, so that hitherto when the groups have been completed they have presented to view 2 feet or so of pots and naked stem, which circumstance detracts greatly from the effect produced. This is a step in the right direction. It would be well if the practice could be generally followed. It is something to have the lead of the National Society in such a direction, and there is reason to believe that what some Chrysanthemum exhibitors unwisely regard as an innovation will be adopted at all Chrysanthemum exhibitions. *R. D.*

RHODODENDRON-HOUSE AT LYTHE HILL, HASLEMERE.—In order to show his appreciation of the beauties of the Sikkim and other Rhododendrons, J. Stewart Hodgson, Esq., had a house built for them about two years ago. Rhododendrons were cultivated under glass before this was done, but only in small numbers, but now many more plants of various species and varieties have been added to the existing collection. Borders have been carefully made in which the plants will be placed, and it is intended to cover the walls, columns, &c., with them as well as to grow specimens in the middle part of the house. Some of the plants reach a height of 8 feet, and all are growing freely, as the foliage I send with this note will show. [The leaves and flowers were very fine. Ed.] The hybrids of Rhododendron are grown in that part of the house which is warmer, and the intention of Mr. Hodgson is to fill the houses altogether with such varieties as have large flowers, these being so much in request for room and other domestic

decorative purposes; noble form, delicate colour, and fragrance being all combined. It is surprising that so small an extent of glass is devoted to this class of plants in most gardens. The species, &c., which we possess are Brookianum, calophyllum, ciliatum, Countess of Haddington, Dalhousianum, Edgeworthi, Gibsoni, Duchess of Connaught, Duchess of Edinburgh, Duchess of Teck, Fosterianum, fragrantissimum, jasmiflorum, javanicum, Lady Alice Fitzwilliam, Maiden's Blush, Nuttallii, Princess Alexandra, Princess Alice, Princess Frederica, Princess Royal, Queen Victoria, Sesterianum, suave, Taylorii, Veitchii, and Veitchii lavigatum. Some of these Rhododendrons are grown in pots for the purpose of filling up the house till the planted out specimens are large enough to occupy the space. Mr. Evans, the gardener at Lythe Hill, takes great interest in hybridising this species of plants, and has already succeeded in obtaining seed from several species, of which he has great hopes. *H. G.*

PEPPERMINT AS A DISINFECTANT.

It is a fashion with some people to treat with contempt the traditions handed down by our forefathers. Before, however, we discard valuable drugs which have been used for generations past, it is always well to search for any new properties which can perhaps be added to their past history.

Many of your readers may not be fortunate enough to have copies of the *Lancet* or *British Medical Journal*, or would care to wade through their contents. I therefore wish to chronicle in your widely read journal the results lately arrived at in favour of Peppermint Menthol.

It has been found, after laborious research, that of all substances and chemicals yet discovered there is nothing known more fatal to bacterial germs of diseases, &c., than Peppermint (*Mentha piperita*). It is found that one three-hundred-thousandth-part of Menthol is sufficient to destroy the bacterial germs. It must be known to many of your readers, by the letter from Mr. E. M. Holmes, F.L.S., of the Pharmaceutical Society, that after a long search the home of the true Menthol plant was discovered to be in Japan. This plant I have discovered largely throughout Europe and America. Mr. J. W. Colcord, of the Pharmaceutical Society of Massachusetts, U.S.A., writes me that Peppermint has withstood 10° below zero of frost; this will prove that the plant is a hardy one. Some correspondents write to tell me they tried the Menthol by pouring hot water upon the foliage, and drinking the infusion in the hottest weather. They experienced great relief to their fatigue, and it was as refreshing as Tea, and they thought it more stimulating. I have had letters asking me if I could supply any of the foliage, so that experiments might be tried by boiling it, and bringing the infusion into a sick-room for its perfume and antiseptic properties, but on looking over my large beds of roots I found none sufficiently advanced to cut. I have no plants being forced, and regret that these experiments must be deferred until later in the spring. One experiment made with the Menthol crystals, which can now be bought of any chemist at a few pence per ounce, will show how preferable is its perfume to the objectionable smell of carbolic acid when exposed in the usual manner in an open vessel.

Medical men, when they come to ponder over these facts, will welcome the results of the experiments showing that Menthol can now be safely relied upon as yielding better results than carbolic acid. *Thomas Christy.*

PEOPLE'S PALACE, MILE END.—The trustees of the Beaumont Trust, the Chairman of which is Sir Edmund Hay Currie, Bart., entertain the laudable desire of furnishing the inhabitants of the Eastern portion of the metropolis with three flower shows within the People's Palace during the course of the ensuing summer. So beneficial a proposal should meet with the approval and ready assistance of all who regard "sweetness and light" for the toiling millions as being something more than a phrase.

SOCIETIES.

ROYAL HORTICULTURAL.

TUESDAY, APRIL 24.—The Drill Hall, James Street, Westminster, presented a gay appearance on this occasion, the incoming harvest of flowers of the season, forced and otherwise, having been abundantly represented by amateurs and the trade; and still further to add to the attraction of the day were the refined products of the florists' skill in the display of Auriculas, Polyanthus, and other sections of the large order of Primulas, brought together under the auspices of the Southern section of the National Auricula Society.

Roses in pots were shown in goodly numbers of dwarf, freely flowered examples; Daffodils in great variety occupied a considerable amount of space, likewise Cyclamen and Alpines. Orchids were few in numbers, but not so the visitors, for so many persons as were in the Hall during the afternoon have not been observed at the Society's meetings for many a day.

Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. W. Wilks, W. Goldring, II. Herbst, W. Bates, W. H. Lowe, C. T. Druery, R. Dean, G. Paul, C. Noble, C. Pilcher, J. Dominy, II. M. Pollett, J. O'Brien, A. F. Lendy, B. Wynne, E. Hill, J. Walker, and Dr. Masters.

Orchids.—F. A. Phillbrick, Esq., Oldfield, Bickley (gr., Mr. Heims), exhibited a bright *Miltonia vexillaria rosea*, the richly coloured *Oncidium Cræsus*, colours pure yellow and brown, the lip of the former colour; *Cattleya Lawrenceana* concolor. A small flowering piece of *Angræcum arcuatum*, bearing a short spike of white blossoms, came from H. J. Buchan, Wilton House, Southampton (gr., Mr. T. Osborne.)

The beautiful *Odontoglossum Humeanum* was sent by Mr. Pollett, Fernside, Bickley: the lip and petals are primrose-yellow, the latter spotted at the base with brown spots arranged in a circle; the dorsal sepal is closely dotted with dark brown over the whole area.

Mr. J. Charlesworth, Heaton, Bradford, showed the brightly coloured *Odontoglossum crispum* variety Charlesworth's, the ground colour of which is white, but which is almost disguised under the numerous crimson spots and suffusion.

One of the largest collections came from the gardens of A. H. Snee, The Grange, Carshalton (gr. Mr. Cummins), and included numbers of rare *Masdevallias*, such as *ludibunda*, *Estrada*, *Houtteana*, *xanthocorys*, some well flowered *M. ignea*, *Angræcum Sanderianum*, &c.

Cypripediums were extensively shown by F. C. Tautz, Esq., Studley House, Goldhawk Road, Shepherd's Bush (gr., Mr. Cowley). Amongst those observed, were *Cooksoni grande*, *Hookera majus*, *Argus*, *Lawrenceanum album rubrum*, a heavily marked flower, with claret coloured pouch, which was glabrous, dorsal sepal purple and marked with hues of a darker tint the petals are bronzy, narrow, with hairy warts on the edges. Of *C. selligerum majus* there was one plant bearing three blooms of great size. The other plants shown consisted of *Odontoglossum Harryanum*, *Dendrobium fimbriatum oculatum*, *Miltonia vexillaria*, *Cattleya Lawrenceana concolor*, pale lilac; and *C. L. rosea*, *C. Schroderi*, with a lip prettily frilled; several *Odontoglossums*, &c. A Silver Banksian Medal was awarded.

Mr. B. S. Williams, Upper Holloway, showed *Odontoglossum F. L. Ames*, a curiously marked flower with white lateral petals, having a patch of a brown colour at the base. The sepals are brown, and brown with green spots, and the lip white. Other plants were *Oncidium undulatum* and *Cattleya Meadellii grandiflora*—the latter a very fine thing.

A bright patch of colour was found in Messrs. J. Veitch & Sons' exhibit of new varieties of hardy Azaleas, hybrids between *A. mollis* and *A. pontica*; *Belle de Gand* and *Coronet* have flowers of primrose-yellow and white; *Etoile de Flandre*, pink and yellow; and *Comte de Kerchove*, orange. The plants were of dwarf growth, and very freely flowered. From the same exhibitors came tree *Pæonies Comtesse d'Endort*, yellowish-salmon; *Queen Elizabeth*, vivid rose. Both bore flowers of great dimensions.

Amaryllis Black Prince, a flower of medium size but good form and of crimson colour, came from Mr. B. S. Williams, Victoria Nursery, Holloway.

Roses in groups were very well shown by three different exhibitors. Messrs. Paul & Son, Waltham Cross, were awarded a Silver-gilt Banksian Medal, for a highly creditable group of standard and bush plants in pots. *Catherine Soupert*, *Hippolyte Jamain*, *Moiret*, *Edward Morren*, *alba rosea*, *Magna Charta*, and *Innocente Pirola*, were conspicuous varieties, the plants bearing several large and well-formed blooms; the same firm also sent a basket of small Rose trees, each bearing a single flower of rich colour. Mr. Wm. Rumsey, Waltham Cross, received a Silver Banksian Medal for a group of pot bushes, in excellent condition, and well flowered; *Madame H. Jamain*, *Perfection de Montpellier*, *Francesque Rève*, *Duchesse de Valombrosa*, and *Magna Charta* being noticeable sorts.

Messrs. II. Lane & Son, Great Berkhamstead, contributed on this occasion, as at the two previous shows, a collection of bushes in pots, all well flowered, and were given a Bronze Banksian Medal for the exhibit. Her Majesty was well represented, and there were also good examples of *Madame Margottin*, *Coquette des Blancches*, *Devoniensis*, *Souvenir d'un Ami*, *Duchesse de Valombrosa*, among others.

From Mr. T. F. Rivers, Sawbridgeworth, came a new Tea Rose, named *May Rivers*, which received a Certificate. It is a flower of the form and size of *Niphetos*, creamy-white, very double, handsome in the bud, and half-opened state, and possesses good substance in the petals. Another Certificate was granted to a climbing form of the *Niphetos* Rose sent by Messrs. Keynes, Williams & Co., Salisbury, who showed a large, well-flowered plant in a pot.

Miscellaneous.—Messrs. Kelway & Son staged a rather large group of double *Cinerarias* and new *Amaryllis*. Of the former the majority of the forms were of light shades, one named *Queen Victoria*, being pure white with a faint reddish-violet tinge at the tip of each segment—it was a very good variety. *Beatrice Kelway* was white with bold rose tips, giving a very pleasing effect. Numerous other varieties were also shown. The *Amaryllis* were dwarf, and the flowers rather small in most instances. There was a great range of variation to be seen in this collection, some being very striking, especially so was *Miss Ainslie*, very dwarf habit, fairly large flower, open and flat, of a scarlet colour, with a white margin and mid-nerve. Other noticeable sorts were *Mont Blanc*, yellowish-white or cream colour throughout, and *Lord Rothschild*, a rich deep red.

Cinerarias (double) were also shown by Messrs. H. Cannell & Sons, Swanley, Kent, showing very rich deep reds and blues. *Asparta* was the finest deep blue; and *Faust*, the best red variety, with large full heads; a peculiar purple-violet variety was named *Advance*; it is a dull colour, and would be likely only to find place as a curiosity. Cut blooms of the beautiful rich creamy-yellow *Carnation Pride of Peshurst*, vigorous plants of *Mignonette*, with large sturdy spikes, and *Begonia Carrièrei villosa*, were also shown by this firm. The *Begonia* was a hairy form of the *B. Carrièrei*, a good decorative sort with white flowers, freely produced. Several pots of *Violet Victoria*, a sort with large, full, and richly coloured dark flowers, very floriferous; two were shown by Mr. J. Chambers, Isleworth—it had already been certificated; and from the same exhibitor were shown pots of *Viola Snowflake*, a good white, with a few violet lines at the eye.

Daffodils, &c., were numerous shown by Mr. Walker, Whitton, Middlesex, who, for a splendid lot of blooms effectively set up, received the award of a Silver-gilt Banksian Medal. Messrs. Barr & Son, Covent Garden, and Messrs. Collins Brothers & Gabriel, Waterloo Bridge Road, each received a Silver Banksian Medal for a large group of cut blooms of *Daffodils*; and for a similar collection a Bronze Banksian Medal was awarded to Mr. T. S. Ware, Hale Farm Nurseries, Tottenham. Of the numerous varieties shown in these groups, the following were conspicuous:—*Albicans*, *Emperor*, *Horsfieldi*, *Leeds* and its varieties, *odoros*, *pallidus precox*, *moschatus*, *Ard Righ*, *Mary Anderson*, *montanus*, *spurius*, *Yellow King*, *Duchess of Westminster*, *Poetiens*, *Nelsoni*, and many others.

Mr. T. S. Ware also showed a few hardy plants, &c., including *Iris pamila coerulea*, delicate cobalt-blue; *Trillium erectum*, *Pothos fetida*, various *Primulas*, *Androsace carnea*, *Megasea Stracheyi*, *pubescens alba*, a pretty variety with pure white flowers; and also a white Dog's-tooth *Violet*, *Erythronium grandiflorum* var., with large pure white flowers.

Messrs. Paul & Son, Cheshunt, N., showed an attractive collection of alpine and rock plants, among which were good pieces of *Androsace Lagerri*, the

pale rose flowers of which are very pretty. *Primula pubescens nivalis* was represented by large plants with large heads of flower; *Primula similis*, bright yellow, and a large head forming a conspicuous object; *Bellis rotundifolia corulescens*, the "blue" Daisy, which was white, with a pale lilac tinge; *Soldanella minima*, *Gentiana verna atrocœrulea*, *Draba Haynaldii*, with numerous yellow flowers, very pretty; *Anemone palmata*, like a yellow Buttercup; and numerous species of *Primula*, *Saxifraga*, &c. Silver Medal.

From the Royal Gardens, Kew, there was sent a most interesting collection of hardy plants and alpines, interesting on account of the number of species shown. One of the most prominent of the subjects shown was *Anemone Faonini*, a South African plant of recent introduction, figured in these columns; it is apparently a vigorous plant, and bears large flowers of pure white; it is somewhat after the habit of *A. japonica*. *Bejaria glauca* delicate rose petals with a narrow dark line down the centre, was also shown; it is much like an *azalea* but more delicate in appearance. *Bougainvillea spectabilis*, rich reddish purple, was very pretty and would be a desirable plant. There were also *Rhododendron arboreum*, *R. Aucklandiæ* × *Hookeri*, and *R. niveum*, which created much prominent. *Pinguicula grandiflora*, a pink variety, collected on the Alps above Grenoble, at 3000 feet altitude; *Echium callithyrsum*, *Corydalis* interest. *Nymphaea tuberosa*, *Marliac's* variety, *Marliacea*, an open flower about 6 inches in diameter, with segments of very pale yellow; the stamens, which are bright yellow, are very tuberosa, *Dicentra canadensis*, *Cereus Mallisoni*, *Narcissus rupicola*, *N. triandrus* vars., with *Saxifraga latipetiolata*. *Primulas* in a great variety of species were also in the collection. *P. × venusta*, with peculiar red-brown flowers, was a very peculiar one; *P. hirsuta* *Allioni* was well shown; it is a good dwarf plant, with good sized flowers of a lilac hue; *P. pubescens*, white variety; *P. Balbisii*, *P. Wulfeniana*, *P. Obstritii*, with a head of large yellow flowers, borne on a stout stalk—rather a coarse plant, &c. There was also shown *Iris caucasiaca*, a small yellow-flowered sort.

Cyclamens were represented by a collection of well-grown plants from Mr. Clarke, Twickenham. Good, vigorous plants of *Mignonette*, were sent by Mr. Sullivan, gr. to D. B. Chapman Esq., Roehampton. A plant of *Begonia glaucophylla* was sent by Mr. J. Crook, The Grange Gardens, Farnborough, Hants, who also showed a few *Primulas*, one of which—an alpine *Auricula*—named *Crimson Beauty*, was specially noticeable on account of its rich claret-coloured flowers.

J. T. Llewellyn, Esq., Penlegare, Swansea, showed cut trusses of blooms of six or eight species of Indian *Rhododendrons*, all flowered in the open ground at his estate in Swansea; they were very creditable, the colours bright and flowers of good size, but it is a pity that no names were attached to the specimens. Mr. S. Ford, Leonardlee, Hiorsham, showed *Passiflora racemosa*, evidently a very free flowerer, bright red in colour; and from the Civil Service Co-operative Society, 25, Haymarket, W., were shown *Daffodils* arranged in basket frames representing a pocket supported on three legs, also a large bouquet of *Daffodils*. Messrs. A. Hart & Son, High Street, Guildford, exhibited a fine *Coleus*, with large thick leaves coloured light and dark crimson, the base of the leaf being yellowish.

FIRST-CLASS CERTIFICATES.

To Messrs. Kelway & Son, for *Cineraria Queen Victoria*.

To Messrs. Kelway & Son, for *Cineraria Beatrice Kelway*.

To Messrs. Cannell & Sons, for *Cineraria Faust*.

To Messrs. Cannell & Sons, for *Cineraria Aspsia*.

To Messrs. Cannell & Sons, for *Cineraria Advance*.

To Messrs. Kelway & Son, for *Amaryllis Miss Ainslie*.

To Mr. T. S. Ware, for *Erythronium grandiflorum albiflorum*.

To Messrs. Keynes, Williams & Co., for climbing *Niphetos Rose*.

To Mr. B. S. Williams, for *Odontoglossum Rossi F. L. Ames*.

To J. Charlesworth, Esq., for *Odontoglossum crispum*, Charlesworth's var.

To Messrs. J. Veitch & Son, for *Pæony (Tree) Comtesse d'Endort*.

To H. M. Pollett, Esq., for *Odontoglossum Humeanum*.

To H. J. Buchan, Esq., for *Angræcum arcuatum*.
To Mr. J. Crook, for *Primula Crimson Beauty*.
To Messrs. T. Rivers & Son, for *Rose May Queen*.

Fruit Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. J. Wright, G. Norman, J. Cheal, G. W. Cummins, T. F. Rivers, J. Lee, T. J. Saltmarsh, P. Crowley, R. D. Blackmore, J. Marshall, S. Ford.

There was not much worthy of note placed before the committee, the best exhibit consisting of Cucumbers, shown by Mr. T. Lockie, Oakley Court Gardens, Windsor, which were of good shape, even, and had not too much neck. Mr. Cummins, Grange Gardens, Carshalton, showed well kept samples of *Pear Pina IX.*, green, with brown spots.

NATIONAL AURICULA AND PRIMULA (Southern Section).

APRIL 24.—The twelfth Auricula exhibition took place in the Drill Hall of the London Scottish Rifles, Westminster, in connection with the ordinary meeting of the Royal Horticultural Society. The dull weather and the darkness of the building failed to show up the flowers to the best advantage; the light and warmth of the Conservatory at South Kensington were wanting, and there was in consequence a lack of expression in the Auriculas. Even the brilliant alpine varieties looked dull in the gloom. It was on the whole an extensive exhibition, despite the retarding character of the season.

Show Auriculas.—In the class for twelve dissimilar varieties, the Rev. F. D. Horner, Lowells, Burton-in-Lonsdale, maintained his supremacy, and set up some flowers having, on the whole, fine quality; they were of green-edges: *Seaweed* (Horner), very bright; *Kestrel* (Horner), Edith Potts (Bolton), a flower of great merit, having a bright green deep edge, good tube, very fine paste, and black body colour, full of life and expression—selected as the premier show Auricula in the whole exhibition; *Prince of Greens*, and *Headley's George Lightbody*, in its green form, or as a heavy grey. Grey-edged: *Atalanta* (Horner), a heavy grey, of fine quality. White-edged: *Maggie and Hypania*, both raised by Mr. Horner; and selfs, *Heroine*, *Laurin*, a very fine maroon self, shaded with magenta; and *Sapphire*, all raised by the exhibitor. 2nd, Mr. J. Douglas, gr. to F. Whitbourn, Esq., Great Gearies, Ilford, whose flowers lacked their usual high quality, seemed to bear traces of too much forcing. The collection consisted of green edges: *Abbe Lizst* (Douglas), *Neatness* (Douglas), and the Rev. F. D. Horner. Grey edges: *Mabel* (Douglas), *Frank Simonite*, *Marmion* (Douglas), a promising new variety of considerable merit; and Mr. Moore (Douglas). White edges: *Beauty and Reliance* (Mellor); and selfs: *Sir William Hewett*, *Dignity* (Douglas), a dark variety of good quality; and *Sapphire*. 3rd, Mr. T. E. Henwood, Hamilton Road, Reading; 4th, Mr. W. Bolton, Warrington, who staged a highly promising seedling, deep blue self. There were five collections in this class.

In that for six dissimilar varieties there were seven competitors, the Rev. F. D. Horner being again 1st. Green edges: *Neptune* (Horner), a fine new variety, and *Prince of Greens*. Grey edged: *George Lightbody*. White edged: *Miranda* (Horner). Selfs: *Melanie* (Horner), dark, very fine and smooth; and *Heroine*. 2nd, Mr. T. E. Henwood, with green edges, Rev. F. D. Horner. Grey edged: *George Lightbody*. White edges: *Acme* and *John Simonite*. Selfs: *Black Bess* (Mellor), and *Horner's Sapphire*. 3rd, Mr. J. Douglas; 4th, J. D. Llewellyn, Esq., Penllergare, Swansea.

In the class for four varieties there were five competitors, Mr. G. W. Wheelwright, Oxford Road, Reading, being 1st, with—Green edge: Rev. F. D. Horner. Grey edge: *George Lightbody*. White edge: *Reliance* (Mellor); and Self: *Heroine*. 2nd, Mr. C. Phillips, Earleigh, Reading, with—Green edge: *Oliver's Lovely Ann*, this old green being seen in unusually fine form. Grey edge: *Lancashire Hero*. White edge: *Acme*; and Self: *Heroine*. 3rd, Mr. W. L. Walker, Earleigh, Reading. 4th, Mr. A. J. Sanders, gr. to Viscountess Chewton, Cobham.

In the class for two dissimilar varieties there were seven competitors, Mr. G. Wheelwright being 1st with—Green edge: Rev. F. D. Horner; and Self: *Black Bess*. 2nd, Mr. C. Phillips, with—White edge: *Acme*; and Self: *Othello*. 3rd, Mr. A. J. Sanders; 4th, Mr. W. L. Walker.

In the classes for single plants fewer were staged

than usual, and by at least one the regulation had been overlooked which states that exhibitors may not stage more than two specimens in each class. Green edges: 1st, Mr. T. E. Henwood, with *Prince of Greens*; 2nd Mr. C. Phillips, with Rev. F. D. Horner; 3rd, Mr. G. W. Wheelwright, with *Lancashire Hero* in its green state; 4th, Mr. C. Phillips, with *Prince of Greens*. Grey edges: 1st, Mr. A. J. Sanders, with *George Lightbody*; 2nd, Mr. G. W. Wheelwright, with *Lancashire Hero*; 3rd, Mr. J. Douglas, with *Mabel*; and 4th with the same. White edges: 1st and 2nd, Mr. J. Douglas, with *Conservative*; 3rd, the Rev. F. D. Horner, with *Heather Belle*; and 4th with *Pearl*, both of his own raising. Selfs: 1st and 2nd, the Rev. F. D. Horner, with *Heroine*; 3rd, Mr. W. Bolton, with *Sapphire*; 4th, Mr. G. W. Wheelwright, with *Black Bess*.

As is usual there were but two competitors with fifty plants each; for it is only those who grow hundreds, that can compete in such a class as this. Mr. J. Douglas was 1st with Green edges, Rev. F. D. Horner, and *Abbe Lizst*: Grey edges, *George Lightbody*, *Frank Simonite*, *Richard Headley*, *Colonel Champney*, *Miss Prim*, *Marmion*, and *Ajax*. White edges: *Earl Grosvenor*, *Conservative*, *Acme*, and *Smiling Beauty*; and selfs, *Sapphire*, Mr. Douglas, *Duke of Albany*, and *Negro*. 2nd, Mr. Charles Turner, with green edge. Mr. Knighton, Turner, and *Imperator*; grey edge, *Confidence*, *Beauty*, and *William Brockbank*; white edge, *Acme*, Mr. W. Brown, Dr. Kidd, and *Conservative*; selfs, Mr. Smith, *Clipper*, *Vulcan*, *Black Bess*, *Lord of Lorne*, *Lord Clyde*, *Meteor*, *Flag*, and C. J. Perry. In this class any number of duplicates are admitted.

Premier Auricula.—This was Bolton, Edith Potts, shown by the Rev. F. D. Horner, in class A.

Seedling Show Auriculas.—Green edges: a 1st prize was awarded to the Rev. F. D. Horner, for *Monarch*, in the way of the Rev. F. D. Horner, good tube, paste, black body colour, and smooth green edge. Grey edge: a 1st prize was awarded to Irreproachable, raised and shown by the Rev. F. D. Horner, a large flower, with a broad edge of grey. White edge: no award was made. Selfs: 1st, the Rev. F. D. Horner, with *Constance* (Horner), a large crimson maroon flower, of good properties; 2nd, Mr. William Bolton, with Mrs. James Tinsley (Bolton), a maroon flower of decided promise.

Alpine Auriculas.—As is usual, these were largely shown, and were highly attractive, Mr. Turner being invincible with his splendid new varieties. The best twelve from Mr. Turner consisted of *Eraest*, *Charles Turner*, very fine indeed, and a worthy memento of this celebrated florist; *John Laing*, *Fred Bates*, *Sensation*, *Sunrise*, *Sir H. Darvill*, *Marguerite*, and *George Wheelwright*, very fine—all golden centres; *Edith*, *Lady H. Grosvenor*, and *Lady Harpur-Crewe*, white centres. 2nd, Mr. J. Douglas, with *Hebe*, *Lovebird*, *Miss Mollie*, *Emperor Frederick*, and *Toujours Gaie*, all raised by Mr. Douglas; *Unique*, *Miss Moore*, *Renown*, and seedlings. 3rd, Mr. G. Wheelwright.

With six varieties Mr. Turner was again 1st, with *Sunrise*, *Reginald*, and *Madonna*, gold centres; *Edith*, *Mrs. Stafford*, and *Lady H. Crewe*, white centres. 2nd Mr. T. E. Henwood, with *Mariner*, *Mrs. Dodwell*, *Mrs. Llewellyn*, *Mrs. Ball*, *Miss Blackburn*, and *Homer*—all very fine; 3rd, Mr. J. Douglas. There were seven exhibitors in this class, and three in the former.

There were five lots of four varieties, Mr. T. E. Henwood being 1st, with *Hotspur*, *Mrs. Ball*, *Princess of Wales*, and *Edith*; 2nd, S. Barlow, Esq., J. P., *Stake Hill House*, *Castleton*, *Manchester*, with *Vesuvius* and three very fine seedlings, one a large and striking flower afterwards named *Sir Trevor Lawrence*. In this class Mr. Barlow certainly had reason to question the decision of the judges. 3rd, Mr. W. L. Walker.

The best single specimen with gold centre was *Pallas*, from Mr. C. Turner; 2nd, Mr. S. Barlow, with *Mrs. Meiklejohn*; 3rd, Mr. C. Turner, with *T. E. Henwood*; 4th, Mr. J. Douglas, with *Hebe*. White centres—1st, Mr. S. Barlow, with *Susie Matthews*, a charming variety that it is somewhat difficult to grow; 2nd, Mr. J. Douglas, with *Queen Victoria*; 3rd, Mr. T. E. Henwood, with *Lady-love*; 4th, Mr. T. E. Henwood, with the same.

Seedling Alpines.—Mr. Turner exhibited a few, but none were considered sufficiently advanced over named varieties. A first-class Certificate was awarded to Mr. S. Barlow for *Sir Trevor Lawrence*, large and of the finest form, golden centre, with black ground and rosy-salmon edge.

Polyanthuses.—The gold-laced varieties certainly lacked the fine quality we have seen in previous

years, and they bore the impress of the untoward effects of the season. Mr. S. Barlow had the best six out of three exhibitors, having *Exile*, *Cheshire Favourite*, and *Prince Regent*, dark colours; *Sir Sidney Smith*, *Lancer*, and *George IV.*, red grounds; 2nd, Mr. J. Douglas, with *George IV.*, *John Bright*, *Sanderson's Naxara*, *Exile*, *Lancer*, and *Elliot's Red Rover*; 3rd, Mr. J. T. D. Llewellyn.

There were five exhibitors of three varieties, Mr. S. Barlow being again 1st, with *Cheshire Favourite*, *George IV.*, and *Exile*; 2nd, Mr. J. Douglas, with *George IV.*, *Lancer*, and *Cheshire Favourite*; 3rd, Mr. R. Dean, Ealing, with seedlings.

The best single specimen was *George IV.*, from Mr. J. Douglas, and he was 2nd with the same; Mr. S. Barlow being 3rd, with *William IV.*, and 4th with *Lancer*.

In the class for twelve fancy Polyanthuses, Mr. R. Dean was 1st, with a good bright lot of seedlings, but not yet at their best, owing to the cold, dull weather; 2nd, Mr. J. Douglas.

Fancy Auriculas.—It is difficult to describe these with accuracy, as they constitute a kind of floral *alla potrida* into which almost anything of an eccentric and not always lovely character may come. Mr. S. Barlow was 1st with a number of seedlings including two or three golden selfs; and Mr. J. Douglas was 2nd with quite a distinct strain. But it is very unlikely any of these will ever be propagated and put into commerce.

Primroses.—The single varieties were as usual bright and effective, even amid the gloom which hung over the hall. Mr. R. Dean was 1st with twelve pots of fine high coloured seedlings; Mr. J. Douglas being 2nd with a good lot also; and Messrs. Paul & Son, 3rd.

Double varieties.—There were but two collections of these, Messrs. Paul & Son being 1st with large made-up pairs of *Crousi*, white, *platypetalaplena*, *Sulphur*, *Negro*, large, deep purple, and *Harlequin*, a mottled variety. 2nd Mr. R. Dean with old *Crimson Blush*, *White Lilac*, *Sulphur* and *Pale Yellow*.

Species of Primula.—These were numerous, shown, and they proved very interesting. Mr. J. T. D. Llewellyn was 1st, with a fine collection, consisting of *P. japonica*, *Auricula*, *verticillata*, *rosea*, *denticulata*, *viscosa*, *cortusoides*, *involutata*, *cashmiriana*, *erosa*, *officinalis* var. *suaveolens*, and *obconica*. 2nd, Mr. J. Douglas, with *P. japonica*, *verticillata*, *rosea*, *intermedia*, *denticulata*, *nivea*, *Auricula*, *Nelsoni*, &c. 3rd, Mr. W. Harper, gr. to H. S. Leonard, Esq., St. Catherine's, Guildford. With six specimens Mr. S. Barlow was 1st, with *P. obconica floribunda*, *rosea*, *nivea*, *viscosa*, and *denticulata*; 2nd, Messrs. Paul & Son, with *P. Auricula*, *Canary Bird*, *ciliata purpurea*, *ciliata nivea*, &c.

There was no entry in the class for a basket of Primrose plants arranged for effect: probably in consequence of the lateness of the season.

ROYAL BOTANIC.

APRIL 18.—The second spring show was held on the foregoing date amid depressing circumstances, for rain fell in torrents, and prevented the company from assembling; but it was an exceedingly bright and pleasing exhibition—probably one of the best of its kind the Society has ever held.

Collections of alpine plants in pots were a good feature, the best coming from Mr. J. Douglas, gr. to F. Whitburn, Esq., Great Gearies, Ilford, who had many species of *Primula*, named *Auriculas*, and *Polyanthus*, bulbous plants, &c. Messrs. Paul & Son, Old Nurseries, Cheshunt, were 2nd, with *Primulas* of various types, charming pots of *Soldanellas*, &c.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, was the only exhibitor of a collection of hardy herbaceous plants.

Auriculas were in fairly good form. Mr. J. Douglas was 1st, having *Abbe Lizst*, *Conservative*, *Acme*, *Marion*, a good new grey-edge, with mealed foliage; C. J. Perry, and *Sir W. Hewett*. 2nd, Mr. C. Turner, Royal Nursery, Slough. Mr. Turner had the best twelve alpine varieties, the best being *Edith*, *Shirley Hibberd*, *Mango McGeorge*, and *Mrs. Thompson*. Mr. J. Douglas was 2nd.

Polyanthuses were shown in poor force, especially the gold-laced varieties.

Roses in pots were an attractive feature. Messrs. Paul & Son had the best nine, Mr. Ramsey, Waltham Cross, being 2nd. In the amateur's class the plants were small, and the flowers poor.

Greenhouse Azaleas were bright and effective. In the amateur's class Mr. R. Scott, gr. to Miss Foster, The Holme, Regent's Park, was 1st, with nine good

half-specimens; Mr. H. Eason, gr. to B. Noakes, Esq., Highgate, being 2nd. In the open class Mr. Turner was 1st with the same number of plants—Roi d'Hollande, Apollo, and Madeline, the two last white varieties being especially noticeable for their high quality. 2nd, Mr. R. Wills, Loughton Nursery, Sydenham.

Messrs. H. Lane & Son, Berkhamstead, were the only exhibitors of twelve Hardy Rhododendrons, and the same number of Azalea mollis, both were valuable and showy groups.

Amaryllis were a fine feature. Mr. J. Douglas was 1st with twelve, the leading varieties being Monarch, Empress of India, Albert Victor, Enchantress, Hector, and Lady Hulse; 2nd, Messrs. Paul & Son, with some very good seedlings.

Cinerarias made a good feature also. Mr. J. James, Farnham Royal, Bucks, was 1st, with named varieties of his own seedlings; Mr. J. Douglas being 2nd. Mr. D. Phillips, gr. to R. W. Mawn, Esq., Langley Place, was the only exhibitor of nine Pelargonium—well-grown and bloomed half-specimens.

Miscellaneous.—Under this head there were a number of exhibits. Mr. T. S. Ware had a large collection of cut Daffodils, and so also had Messrs. Barr & Son, Covent Garden, and Messrs. Collins, Bros. & Gabriel, Waterloo Road. Messrs. W. Cutbush & Son, The Nurseries, Highgate, had several boxes of charming Epacris in bloom. From Mr. John Odell, Gould's Green, Hillingdon, came a fine collection of Cyclamen persicum; also from Mr. W. Hibbert, gr. to W. Clay, Esq., Kingston. Mr. B. S. Williams, Victoria Nursery, Holloway, had a fine group of foliage and flowering plants; and a smaller one was staged by Mr. Kemp, gr. to H. Barry, Esq., Winchmore Hill. Mr. J. Chambers, Westlake Nurseries, Isleworth, had a number of plants of his new double blue Violet, Victoria, a good grower and very fine. Messrs. H. Cannell & Sons, nurserymen, Swanley, had about fifty plants of double Cinerarias, admirably grown and bloomed—Aspasia, deep blue; Faust, rosy-magenta; Rosina, in the same way, but deeper in colour; Dante, violet-rose; Nemesis, like Faust, but not so good, were the best.

Mr. C. Turner had a box of twenty-four blooms of very fine winter-blooming Carnations.

Messrs. Veitch & Sons, Royal Exotic Nurseries, King's Road, Chelsea, had Phalenopsis gloriosa, Rhododendron Unique and R. La Belle, and a group of very fine Amaryllis.

FLORAL CERTIFICATES OF MERIT.

To Mr. J. Odell, for Cyclamens Lord Hillingdon and Dixon Hartland.

To Mr. J. Chambers, for Violet Victoria.

To Messrs. H. Cannell & Sons, for double Cinerarias Aspasia, Rosina, and Faust.

To Messrs. Veitch & Sons, for Amaryllis Aspasia, Exquisite, and Thackeray.

To Mr. J. Douglas, for Amaryllis Monarch and Albert Victor.

To Mr. H. Bennett, for H.P. Rose Duchess of Rutland and R. minutiflora alba.

To Mr. J. Douglas, for show Anriculas Marmion, and alpine Emperor Frederick.

To Messrs. Barr & Son, for Narcissus bicolor Rev. J. B. M. Camm and seedling Duchess of Westminster.

THE WEATHER.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING MAY 5. (AVERAGE OF FORTY-FOUR YEARS.)

April 29 50°·4	May 3 51°·5
.. 30 50°·7	.. 4 51°·7
May 1 51°·0	.. 5 52°·0
.. 2 51°·3	Mean for the week ... 51°·2

THE PAST WEEK.

The following summary record of the weather for the week ending, April 23, is furnished from the Meteorological Office:—

"The weather was mild and seasonable as the period commenced, but afterwards became cold and dull very generally, with some falls of sleet at some of our eastern and northern stations, and heavy rain over the south-east of England. During the earlier days of the week thunder and lightning were experienced in some parts of Great Britain.

"Temperature has been below the mean in all districts, the deficit ranging from 2° in the 'Channel Islands' to 3° or 4° in the other parts of the kingdom. The highest of the maxima, which were recorded in most places on the 17th, ranged from 56° in 'Scotland W.' and the 'Channel Islands' to 62° in 'England E.' Towards the end of the period the maxima were much lower, being below 50° at nearly all stations, and in several instances below 45°. The absolute minima were generally registered either on the 21st or 22nd, when the thermometer fell to between 26° and 31° in Scotland, 34° and 36° in Ireland, and 33° and 36° over England. In the 'Channel Islands' the lowest reading was 40°.

"Rainfall has been more than the mean in all the 'Wheat-producing' districts; but in the 'Grazing' districts the amount has not differed materially from the normal.

"Bright sunshine has been very deficient in all districts, the percentage of the possible amount of duration ranging from 10 in 'England N.E.' to 27 in 'Scotland N.' and to 31 in the 'Channel Islands.'

[Accumulated temperature indicates the combined amount and duration of the excess or deficit of temperature above or below 32° F. for the period named, and is expressed in Day-degree—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Obituary.

ERNEST WINFIELD MARKHAM.—We regret to record the death of Mr. E. W. Markham, grandson of the late Sir Joseph Paxton. Mr. Markham was born on October 3, 1867, and died April 21, 1888. The funeral took place at Brimington Cemetery, and was attended by a large concourse of people.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

BOX TREES LOSING THEIR BARK.—We have here a thick plantation of Box trees, a number of the stems of which, measuring from a foot to 18 inches in circumference, and from 15 to 20 feet high, are losing their bark at points from 6 to 18 inches of the ground, and coming off all around the stems. I should be glad to know if any of your readers have remarked a similar affection of the Box, and if the trees will be injured thereby. Can it be due to want of light and air? and would cutting out some of the trees, and thus letting in more light, prevent those that are unaffected losing their bark? Thos. Weaver, Oakley Hall, Hants.

NOTICES TO CORRESPONDENTS.

ARAUCARIA: *Lymington*. What you send are the unripe male catkins. It is not often that male cones occur on the same tree with the females, but that they do so occasionally is shown by an illustration figured in our columns some years ago.

ASH TREES OVERGROWING A NEIGHBOUR'S LAND: *Subscriber*. If, after making a request in writing to the owner of the trees to have the encroaching branches removed, he should not take steps to remove them, you can legally cut them off up to the boundary line of your respective properties.

CATTLEYS: *J. M.* Yes, the plants would certainly be benefited by the removal of the pseudo-bulbs.

CORRECTIONS: In last week's number, April, 21, p. 489, 3rd col., 8th line from the bottom, for "short" form, read "sport" form; and at p. 503, middle col., "Boilers," 8th line from commencement of paragraph, for 8 feet read 8 inches.—In the Ghent Show report, p. 500, col. b, it is stated that M. Bray was awarded 2nd in the class for thirty Orchids (amateurs); but that gentleman writes to say that it was Mad. Block, of Brussels, who took the award, he not exhibiting in that class.

CLIMBER TO COVER A HOUSE QUICKLY: *G. Reeves Smith*. There is nothing better than the common Virginian Creeper, but if an evergreen is required get the common, Regners', or the Algerian Ivy. No plant that you can buy will make much growth the first season. It must get established in the soil before it will grow rapidly.

CUCUMBERS: *A Thirty Years' Subscriber*. Your plants have grown with too great rapidity, so that the even balance of growth has been destroyed. We approve of top flow-pipes, but, as you say, the plants should be kept from too close proximity to them.—G. N. Methods of planting are various. If yours is a house, you may plant one plant on slight mounds, or on one long ridge, at 1 1/2 feet apart, or two plants on mounds standing 4 feet apart. Avoid crowding the foliage, and pick off all flowers until the trellis is nearly covered with shoots, and afterwards do not let the plants bear large numbers of male flowers, and do not over-crop with fruits. If bees are not plentiful, apply the pollen by some means. If hotbed frames are used, put a mound in the middle of each light, the top being about 8 inches from the glass, and put two plants in each mound.

DAFFODIL, SIR WATKIN: *J. D. and S.* Many thanks: a fine sample.

DENDROBIUM WARDIANUM: *H. C.* An excellent variety.

DRESSING CALICO: *S. W. T.* Fasten the calico tightly on a frame, and wash it over with hot linseed oil, applied with a painter's brush. Let it remain on the frame till dry.

GARDENIAS: *H. P.* Not the root worm, but some other disease on which we will give you further information later on.

GLADIOLUS: *D.* In a sad condition. See *Gardeners' Chronicle* of September 30, 1876. Destroy every corn.

INSECTS: *J. G., Chester*. We have carefully examined with a lens your young Vine leaves and shoots, and only found a single young thrip, and not a single mite or red-spider. Fumigation, syringing with gas-tar and soap-suds and subsequently with clean water, are excellent remedies. *I. O. W.*

"KEW BULLETIN": *H. C.* Sold by Messrs. Spottiswood & Son, Queen's Printers, price 2d.

MUSHROOM BEDS: *Irwin*. They seem to be grubs of some kind, not mites. Try a dressing of salt.

NAMES OF PLANTS: *S. W. T.* *Diplacis glutinosus*.—*E. H. C.* *Erythronium Dens-canis flore-pleno*.—*W. M.* *Allium neapolitanum*, common in the Riviera, and sent in large quantities to our markets from the South of France.—*G. H.* 1, *Sericolobonia Penrhosihensis* x, a hybrid between *Sericographis* and *Libonia*; 2, *Panax Victoriae*.—*S. B.* 1, *Narcissus albicans*; 2 and 4, *N. pseudo-Narcissus*; 3, *N. obvallaris*; 5, *N. Telamonius plenus*.—*O. T.* *Not Inga pulcherrima*, but *Calliandra Tweediei*.—*B. H. M.* *Corynostylis hybanthus*.—*W. G.* 1, *Senecio* species; we are unable to name this, unless you can state the country; 2, *Arum palestinum*, Boiss.—*A. G.* *Adiantum*: please say where it came from, &c. We cannot undertake to

name florists' Violets. Ask some grower.—*Houndswood*. 1, *Lycaste Laurenceana*; 2, *Oncidium carthagineum*.—*F. G. T.* *Dendrobium luteiformum*.—*W. S.* *Oncidium nigratum*; *Odontoglossum blandum*, under name; specimen was smashed in the post; *Masdevallia Veitchii*: a fairly good variety.—*C. M. S.* *Sansevieria zeylanica*.—*J. N.* *Omphalodes verna*. It is not what is commonly called Forget-me-not (*Myosotis*), but is, of course, closely allied to it.

NARCISSUS: *S. T.* You send two forms, one princeps, the larger of the two; the other, with the very reflexed trumpet, is *N. nobilis*. We cannot undertake to gauge the commercial value.

SCHOOL OF FORESTRY: *E. J.* Inquire at the India Office, Forestry Department, Whitehall, London.

SEED DRILL FOR GARDENS: *A Soldier*. There is no rake made of the kind you named, but small seed drills with one, two, and three feeds, are sold by ironmongers, and some of the largest nurserymen.

SULPHUR OF POTASSIUM: *Enquirer*. The Grapes may be eaten with safety.

TOMATO: *J. H. G.* There is no fungus, no "disease," and, as far as I can see, no insects, or traces of any, on the Tomato plant. There are streaky discolorations on the stem, beginning at the top (?) and running down, which might have been caused by water trickling down, and becoming heated on the stems. As the writer says the damaged plants are all "near the pipes," this idea may be correct, but I cannot say for certain. The injury is mechanical, and it is not "disease." *W. G. S.*

TREES AND SHRUBS BY THE WATER-SIDE: *Pluvialis*. On the northern shore of the lake dense and dark Pines and Firs, as *Pinus Strobus*, *P. maritima*, common Spruce, and *Juniperus virginiana* might be placed. In this position the trees in some cases may approach quite close to the water without their shadows making it appear black, as would be the case if planted on any other side. Other groups might consist of *Catalpa syringifolia*, Mountain Ash, pyramidal Oaks and *Acacias*, and some of the *Thuias*, as *T. plicata*, *T. Warreana*, *T. aurea*, *T. dolabrata*, *T. borealis*, *Juniperus sinensis*, *C. depressus Lawsoniana*, Alder in variety, American Oaks with beautiful autumn foliage, *Sophora pendula*, Tulip tree, Sea Buckthorn, and a few Weeping Willows. The common Elm by the water's edge, if planted in a large group, makes an imposing, towering mass of foliage, and is as effective as any exotic tree we know. Shrubs may consist of Laurels, Berberis in variety, Lilac, *Symphoricarpos racemosus*, Forsythia, *Juniperus tamariscifolia*, *Rhododendrons*, *Menziesias*, *Kalmias*, *Rhus cotinus*, *R. typhina*, *Kerria japonica*, *Staphylea trifoliata*, *S. colchica*, *Viburnums* in variety, Thorns, and many others.

* * * Orchid bloom in great variety, but the demand not very good.

SEEDS.

LONDON: April 25.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that the recent wet and unseasonable weather has, as might be expected, naturally checked for a time the sowing demand for field seeds. Nevertheless holders manifest great firmness, fully believing that a considerable business has yet to be transacted. Values this week are generally without important variation, but keep low; whilst stocks are in moderate compass. Of Spring Tares the supply on the spot is almost exhausted; quotations are consequently higher. For bird seeds the sale is very slow. Blue Peas are advancing. Sowing Rape seed is steady. In Linseed there is no alteration.

POTATOS.

BOROUGH AND SPITALFIELDS: April 24.—A firm but rather slow trade, with moderate supplies. Regents, 60s. to 110s.; Magnum Bonums, 50s. to 105s.; best Dunbar, 65s. to 110s.; Champions, 50s. to 110s.; German Red, 80s. to 90s.; Dutch Rocks, 55s. to 100s. per ton. STRATFORD: April 24.—Quotations:—Scotch Regents, 80s. to 90s.; do. Magnums, 80s. to 95s. English do., 60s. to 75s.; English Feulands, 45s. to 55s. per ton.

Recently Completed, with 1937 Full-Page Coloured Plates.

SOWERBY'S ENGLISH BOTANY.

Containing a Description and Life-sized Coloured Drawing of every British Plant. Edited and brought up to the Present Standard of Scientific Knowledge by the late

J. T. BOSWELL, LL.D. F.L.S. &c.

THE FIGURES BY

J. E. SOWERBY, J. W. SALTER, A.L.S., and N. E. BROWN.

Third Edition, in 12 vols., super-royal 8vo, £24 3s., in cloth, £26 11s. in half-morocco, and £30 9s. whole morocco.

Also 89 Parts, 5s. each, except the Index Part, 7s. 6d.

*. The Work has for nearly a century been the chief authority on English Botany, and in its present form may fairly be taken as the most complete representative of the present state of knowledge of British Plants.

LONDON: GEORGE BELL AND SONS, York Street, Covent Garden, W.C.

SANKEY AND SON'S GARDEN POTS.

From Messrs. MARSHALL BROS. AND CO., Barnham and Brighton, Agents for our Pots for Brighton and district.
 "GENTLEMEN.—The last consignment of 16,000 pots to hand in very good condition. We like your pots very much; they are light, and very durable, and we save fully £50 per annum by using them instead of our local pots."

From Messrs. ARMITAGE AND SON, Nurserymen, Huddersfield.

"We have used for over twenty years, and are still using and selling, only Sankey's Nottingham-made Garden Pots."

"BULWELL POTTERIES,"
 NOTTINGHAM.

Carriage and Breakage Free on £10 Orders. Half

Carriage and Breakage Free on £5 Orders.

Samples (carriage free) gratis, prices free on application.

From Messrs. HARLEY AND SONS, Dundee and Perth, N.B.

"We are very pleased with quality of your pots; we grow large quantities of plants for market, and find nice-looking pots make the plants look and sell better; yours are not only superior to others in colour and shape, but are not half the weight, yet stronger, neither do they turn green."

From Messrs. WALSHAW AND SON, The Nurseries, Scarborough.

"The pots are so superior over all others we have used that we shall have great pleasure in placing our orders exclusively with you."

CONTRACTORS TO HER MAJESTY'S WAR DEPARTMENT.

Estate Sales.

The best County medium for Advertising Sales of Estates is

THE WORCESTER HERALD, the largest and leading County paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution, plans and particulars of Estates, Catalogues of Machinery Furniture, Books, and other property advertised in the columns of the Worcester Herald. Specimen copies sent free. Published Friday for Saturday, price 2d. Offices, 72, High Street, Worcester.

Sales of Stock and Agricultural Effects.

THE WORCESTER HERALD is the most effective organ for giving publicity to announcements of this class. It is the largest and leading Agricultural paper in the county, and circulates most extensively among Agriculturists in and around Worcestershire. Specimen copies free. Published Friday for Saturday, price 2d. Offices, 72, High Street, Worcester.

Farms to be Let.

LAND AGENTS, ESTATE MANAGERS, and all having Farms to Let, would do well to Advertise in THE WORCESTER HERALD, the Largest and Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large Circulation, moderate charge. Specimen free. Price 2d. Published Friday for Saturday. Offices, 72, High Street, Worcester.

POPULAR GARDENING BOOKS.

By far the most widely read on the subject, full of soundest and best information, Mr. Ryder's writings have been praised by every Gardening Paper. The books are practical, interesting, reliable, and please all readers.

How to Grow Roses in the Garden and in Pots under glass. Chapters on Budding, Grafting, &c., &c. Post-free, 7d.

How to Grow Tuberous Begonias. Chapters on Raising Seed and every other part of culture. A new and thoroughly revised edition. Post-free, 7d.

Every Amateur and every Gardener as well should read these books. Only to be obtained from

RYDER AND SON, Seed Merchants, Sale, Manchester.

TO CAPITALISTS.

IS IN WANT OF £3000 to £5000,

to further Develop a Largely Increasing Business.—Address, in first instance, Box 32, Gardeners' Chronicle Office, 41, Wellington Street, Strand, London, W.C.

See Next Page.

SEE PREVIOUS PAGE.

AN OLD ESTABLISHED FIRM in the Wholesale Flower Trade REQUIRES a PARTNER with not less than £3000, to assist in developing a rapidly expanding business.—Apply by letter to FLOS, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

PARTNER (Practical), with Capital, WANTED for Nursery Business in Midlothian.—Address, No. 25, Keith & Co., Advertising Agents, Edinburgh.

GARDENER, Box No. 3, Post Office, Rugby, THANKS ALL APPLICANTS for FOREMAN'S PLACE, which is NOW FILLED.

HEAD GARDENERS seeking Situations can hear of REMUNERATIVE EMPLOYMENT (temporary or permanent) in their own neighbourhood. Horticultural.—Address, TRADE, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a young Man, age about 22 years, as UNDER GARDENER. Must have good knowledge of Stove and Greenhouse Plants, Grapes, and General Fruit Culture.—THOMAS PARKER, The Gardens, Moreton Court, near Hereford.

WANTED, a thoroughly trustworthy competent Man as WORKING FOREMAN and MANAGER for Glass; must have a knowledge of the Seed Trade and be able to make up orders. Would have to attend market once a week, and attend to customers generally. Proper assistance in each department. None need apply who cannot produce unexceptionable references as to honesty, ability, and sobriety. Apply stating age, wages, expected and full particulars, by letter only in the first instance, to Messrs. SANDY AND SON, Nurserymen, &c., Stafford.

WANTED, a young MAN, to take a leading part in Growing Plants for Decoration; in Houses. 17s. per week, bothy, &c.—G. KEATES, Temple House Garden, Marlow.

WANTED, an experienced SECOND HAND, in Gardens. Total abstainer. Apply, Bishopwood House, Highgate, N.

Assistant Propagator.

WANTED, a young MAN, who has had some experience of General Nursery Work (Indoor), desirous of improvement, and willing to exert himself; some knowledge of Grafting preferred.—State age, wages, &c., to ADIANTUM, 41, Wellington Street, Strand, W.C.

WANTED, a Young MAN, used to Growing Plants for Market, quick at tying, Potting, and Watering.—Apply, with reference, and wages expected, to JOHN TURLE, The Nurseries, Welling, Kent.

WANTED, IMMEDIATELY, TWO respectable Young MEN, well up in Growing Cucumbers, Tomatos, and Flowering Stuff for Market. Quick at Potting, &c.—Apply, stating wages required, where, and last employed, to R. GRIFFIN, Wellbrook Nursery, Farborough, Kent.

WANTED, TWO Young MEN, used to Fruit and Plant Growing for Market. Wages from £1 per week.—FOREMAN, Turnford Hall Nursery, near Hoddesdon, Herts.

WANTED, a Young MAN, principally for Pleasure Grounds, who understands Belding-out. Wages 17s. per week, with bothy.—Apply, by letter, to J. OSBORNE, Wykehurst Gardens, Bolney, Haywards's Heath, Sussex.

WANTED, THREE or FOUR MEN, in the Houses. Must be good Grape Thinners. Also a permanent situation for a MAN with good practical experience in Grape Growing.—H. DICKENSON, Shardlow, near Derby.

WANTED, a Young MAN, in the Houses, under the Propagator, who can Graft, Pot, and Tie well.—F. STRUET, Heatherside Nurseries, Farnborough Station, Hants.

WANTED, AT ONCE, a young MAN, quick at Potting and Tying, and willing to make himself Generally Useful in a Trade Nursery. Wages £1 per week.—T. BALDWIN AND SON, Edith Nursery, Banhall Road, Leyton.

WANTED, a young MAN, in the Houses, under the Foreman. Must be experienced in the Making of Wreaths, Crosses, &c., and be well up in the Propagation of Soft-wooded and other Plants.—Apply, stating age, wages expected, reference, &c., JOHN CRANSTON AND CO., King's Acre, Hereford.

GARDENING APPOINTMENTS.

Mr. JOHN PHILIPS, late General Foreman at HANS NIEMAND & Co.'s Nurseries, Birmingham, and formerly of the Royal Horticultural Society's Gardens, Chiswick, has been appointed Manager of Messrs. IRELAND & THOMSON'S, Golden Acre Nurseries, Edinburgh.

Mr. THOMAS RICHARDS, late Head Gardener to the Right Hon. Lord TEMPLEMORE, has been appointed Head Gardener to Sir JOHN A. HAY, King's Meadows, Peebles, Scotland.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

E. P. DIXON AND SONS, Hull, can RECOMMEND a few competent HEAD GARDENERS, FOREMEN, and JOURNEYMEN, and will be glad to give full particulars to any Lady or Gentleman requiring the same.

SCOTCH GARDENERS.—JOHN DOWIE (of the late firm of Downie & Laird), Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Bailiffs, &c.

JOHN LAING AND SONS, having filled many important places, can RECOMMEND with every confidence, energetic and practical MEN of tested ability and first-rate character. Ladies and Gentlemen in want of Gardeners and Bailiffs, or Gardeners for first-rate establishments, or Single-handed situations, can be suited, and have full particulars by applying to us. No fees charged.—JOHN LAING AND SONS, The Nurseries, Forest Hill, S.E.

NURSERY MANAGER.—Advertiser seeks an engagement in a Leading Establishment. Many years associated as Manager with some of the largest English and Scotch Houses.—QUERCUS, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

ORCHID GROWER; age 32, married.—R. C. FRASER, last two years Gardener and Orchid Grower to R. H. Measures, Esq., Woodlands, Streatham, London, is open to re-engagement. Extensive experience in Orchid Cultivation, Plant and Fruit Growing, and General Gardening. Highest testimonials.—R. C. F., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD), where two or three are kept; age 29, single.—J. AMYS, Gardener to the Hon. Mrs. Eliot Yorke, Hamble Cliff, Southampton, can with confidence recommend his Foreman, G. Dovey, as above.

GARDENER (HEAD), where two or three are kept; age 30.—W. RYE, The Gardens, Sneyd Park, Bristol, would be pleased to recommend his Foreman, who has been with him six years. Well up in all branches.

GARDENER (HEAD).—Lord RAGLAN wishes to recommend his Head Gardener. Thoroughly up to all branches. Leaving no fault. Six years' character.—W. S., Cefntilla Court, near Usk, Monmouthshire.

GARDENER (HEAD).—Owing to the death of Cruger Miles, Esq., his Head Gardener is in want of a situation. Sixteen years' experience in all branches.—F. FERRY, Penpole, Bristol.

GARDENER (HEAD).—Age 36, married; twenty-two years' thorough practical experience in good establishments; four years in last situation, and six and a half years previously as Head. Abstainer. Character of highest order.—MARSHALL, 3, Albert Terrace, Castle Hill, Ealing.

GARDENER (HEAD).—Age 33, married, no family.—C. J. ABBOTT, Esq., wishes to highly recommend his Head Gardener; seven years and seven months' excellent character; well up in all branches. Leaving through no fault.—G. CARPENTER, Rydens, Walton-on-Thames.

GARDENER (HEAD); middle-aged.—W. SWAN, late of Fallowfield, is now open to an engagement; thorough practical knowledge of all the branches of the profession; Orchids a speciality. First-class character and testimonials.—W. SWAN, 32, South Meadow Lane, Preston.

GARDENER (HEAD).—Mr. TILLYARD, Gardener to the Right Hon. the Earl of Yarborough, will be pleased to recommend his Foreman, Samuel Scott, as above, in a good establishment.—The Gardens, Brocklesby Park, Uleby, Lincolnshire.

GARDENER (HEAD).—Age 42; thoroughly understands all kinds of Gardening; would not object to the Management of a Small Farm as well. Nine and a half years' good character. One son, been in the Garden.—GARDENER, Mrs. Chartwright, Albourne Place, Hassocks, Sussex.

GARDENER (HEAD).—A GENTLEMAN wishes to recommend a Head Gardener, thoroughly experienced in Stove and Greenhouse Plants, Vines, Melons, Flower and Kitchen Garden.—Rev. F. E. AINGER, Dalton, Newcastle-on-Tyne.

GARDENER (HEAD); age 39, married eight years, no family. A GENTLEMAN highly recommends his Head Gardener. Practical life experience in Vines, Orchids, Stoves, Greenhouses, Pleasure, Fruit, and Kitchen Gardens.—GEO. MARSHALL, 39, Thale Road, Streatham.

GARDENER (HEAD).—Age 35, married; twenty years' practical experience in good establishments in Early and Late Forcing of Fruit, Flowers, and Vegetables, the Cultivation of Stove and Greenhouse Plants, Orchids, &c.; also Kitchen Garden and Pleasure Grounds. Five years' good character.—JOHN PINLAYTON, Farnham Royal, Slough, Bucks.

GARDENER (HEAD WORKING).—Well up in Forcing all kinds of Fruit and Flowers.—W. B. KETTLE, Field's Farm, Dancer's Hill, Barnet.

GARDENER (HEAD WORKING).—Age 32, married, one child; Scotch. Abstainer. Sixteen years' practical experience. Good testimonials.—M., 34, Kew Bridge Road, Middlesex.

GARDENER (HEAD WORKING), to any Lady or Gentleman, where two or more are kept.—Good practical experience in all branches. Can be highly recommended by previous and present employers.—J. H., Brooklands, Weybridge, Surrey.

GARDENER (HEAD WORKING), where one or two more are kept.—Age 36, married; thorough practical experience in all branches. Nine years' Head in present situation. Leaving through breaking up establishment.—HILL, Stubton Hall, Newark, Notts.

GARDENER (HEAD WORKING).—Age 33, married, two children; thoroughly understands the Management of a Large Garden in all its branches, including Orchids and Bouquet Making. Could manage Meadow Land and Stock, if required.—G. E., Black-poll, Swansea.

GARDENER (HEAD WORKING), where more are kept.—Age 38, married, one child (7); twenty years' thorough practical experience in all branches of the profession in large establishments. Over six years in present situation, and leaving when suited. Highest references for abilities and character.—GILBERT, Vale Lodge, Leatherhead, Surrey.

GARDENER (HEAD WORKING), where more are kept.—Middle-aged; no family. To any Lady or Gentleman requiring the services of an energetic trustworthy man. Thirty years' first class experience in large establishments. Land and Stock if required. Character of the highest order. Good reasons given for leaving.—A. B., care of Mr. Reed, Jordon's Cottages, Bexley, Kent.

GARDENER (HEAD WORKING), or GARDENER and BAILIFF.—No family; thoroughly practical in every branch. Also well up in Land and Stock. Good character and reference. Highly respectable.—J. LONDON, 6, Percy Terrace, Percy Road, Greet, Birmingham.

GARDENER.—A GENTLEMAN, leaving his country house, highly recommends his Gardener, who has lived with him seven years; understands Glass, and Flower and Kitchen Gardens.—J. B., Banbury Road, Brockley.

GARDENER; age 32.—R. SANDERS, Gardener to A. de Rothschild, Esq., will be pleased to recommend his Foreman, A. Freuch, to any Lady or Gentleman requiring a Gardener. Over six years in present place.—Halton Gardens, Tring, Herts.

GARDENER, or GARDENER and BAILIFF.—Age 43, married, one child (aged 13). Wife could take charge of Poultry and Small Dairy. Advertiser can manage Vines, Kitchen Garden, Plants, &c. Excellent testimonials for the last eighteen years.—F. B., Mr. Maurice Young, The Nurseries, Milford, Surrey.

GARDENER, where another is kept, or SINGLE-HANDED.—Age 27, married; abstainer. Eleven years' experience in all branches. Good character.—J. W. M., 65, Natal Road, Streatham, S.W.

GARDENER (good SINGLE-HANDED), or where help is given.—Age 30; fourteen years' practical experience in all branches. Twelve years' excellent characters. Wife thorough Landress if required.—W. E., The Cottage, Arkley Hall, High Barnet.

GARDENER (SINGLE-HANDED), or where help is given.—Age 28, married, two children; eight years in present situation, and well up in all branches. Can be well recommended by present employer.—Mr. CREASY, Bamfont, near Crawley, Sussex.

GARDENER (SINGLE-HANDED), or where help is given.—Age 37, married, no incumbrance; understands Greenhouse Plants, Vines, Flower and Kitchen Gardening. Wife good Landress. Three years' excellent character from present situation.—E. W., Holmsdale, Dorking, Surrey.

GARDENER (SINGLE-HANDED).—Age 32, married when suited; experienced in Stove and Greenhouse Plants, Fruit, Flower, and Kitchen Garden. Willing to be useful. Total abstainer. Highest references as to ability and character.—A. B., Mr. Abbott, Grocer, Belvedere, Kent.

GARDENER (SECOND, or SINGLE-HANDED).—Age 25, single; four years' experience in the general routine of gardening. Good character.—R. HUXTABLE, Gardener, Barton Grange, Taunton.

GARDENER (SECOND or SINGLE-HANDED).—Age 26, married; thoroughly understands Forcing and Plant Growing. Good character. Thirteen years' experience.—M. P., Woolhampton, near Reading, Berks.

GARDENER (SECOND), where four or five are kept.—Age 23; thoroughly experienced in the Management of Glass and Kitchen Garden.—J. H., Tudor House Cottage, Chiswick.

Would not object to help in Office or Florist Business. Excellent testimonial.—FLORA, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SHOPMAN, or ASSISTANT.—Age 22; six years' experience. Accustomed to brisk Counter Trade in Seeds and Plants.—SEEDS, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS.—Nervousness and indigestion deplete the system, and when first the nerves feel unstrung, and listless-ness supplants energy, it is the right time to take some alternative as Holloway's Pills to prevent disorder running into disease. These excellent Pills correct all irregularities and weaknesses. They act so kindly yet so energetically on the functions of digestion and assimilation, that the whole body is revived, the blood is rendered richer and purer, the muscles be-come firmer and stronger, and the nervous and absorbent systems are invigorated. These Pills are suitable for all classes and all ages. They leave a most marvellous effect on persons who are out of condition; they soon rectify whatever is in fault, restore strength to the body, and confidence to the mind.

| .. Fairrieanum | .. Pescatorei |
| .. Dominianum | .. Alexandrae |

Cypripedium barbatum grandiflorum nanum. Rare Vandas, Aërides, Phalaenopsis, Angraecum, &c.

The FIRST PORTION of the above COLLECTION WILL BE SOLD on WEDNESDAY and THURSDAY, May 9 and 10, at half-past 12 o'clock precisely each day.

On view morning of Sale and Catalogues had.

N.R.—Every Plant in the Collection will be included in these Sales, and none sold privately.

Sale Monday, May 14.

Instead of date previously announced, **CATTELEYA LAWRENCEANA**, specially large and fine flowered variety. See dried flowers.

MR. J. C. STEVENS will **SELL** by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, May 14, by order of Mr. F. Sander, a specially large and grand importation of **CATTELEYA LAWRENCEANA**. This consignment has been collected in a quite different district, from whence no Cattleya Lawrenceana have ever been introduced. There is as much difference between this and the ordinary C. Lawrenceana as there is between the starchy variety of *Odontoglossum crispum* and the broad petalled forms. The dried flowers on view will give some idea of the magnificence of this variety.

On view morning of Sale, and Catalogues had.

Sale Monday, May 14.

RADIATUM and other extraordinary varieties of **ODONTOGLOSSUM VEXILLARIUM**.

MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, May 14, by order of Mr. F. Sander, a fine lot of **ODONTOGLOSSUM VEXILLARIUM**, consisting of the finest possible forms.

On view morning of Sale, and Catalogues had.

Sale, Monday, May 14.

VANDA TERES ANDERSONIANA.

MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, on MONDAY, May 14, by order of Mr. F. Sander, a superb lot of the above grand Vanda. The plants have arrived in specially fine order.

On view morning of Sale, and Catalogues had.

Sale, Monday, May 14.

CYPRIPEDIUM SCHOMBURGKIANUM. Grand importation.

Discovered by Richard Schomburgk near the Roraima Mountain as far back as 1842. In 1844, Mr. Im Thurn re-discovered it, but in another locality, no plants however came to this country. Mr. Kromer, our collector, found it in Schomburgk's original locality, and the plants having been under his care, have arrived in fine condition. In growth the plant resembles Pearcei, and it will be found of very easy culture, and should be grown in the Cattleya-house, and be kept very moist always. The flower-spike resembles that of *C. Schlimii*, and the flowers are about 2½ inches in diameter, they are of a deep brown colour, the dorsal sepal lighter and veined, pouch reddish, the sepals stand rectangular from the flower, and are very pointed. Schomburgk says, in the description of his journey, that he found "a new superb sweet-scented Cypripedium."

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on MONDAY, May 14.

On view morning of Sale, and Catalogues had.

Sale Monday, May 14.

ODONTOGLOSSUM NEVADENSE. will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on MONDAY, May 14, very fine plants of *ODONTOGLOSSUM NEVADENSE*. This fine *Odontoglossum* is extremely rare and beautiful, and very few exist in collections.

On view morning of Sale, and Catalogues had.

Sale Monday, May 14.

LÆLIA ANCEPS, White.

MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on MONDAY, May 14, a splendid lot of white *LÆLIA ANCEPS*, consisting of very fine masses in the best condition, the eyes being sound and unbroken.

On view morning of Sale, and Catalogues had.

Thursday, May 17.

SPECIAL SALE OF ORCHIDS in FLOWER and BUD. **MR. J. C. STEVENS** begs to announce that his NEXT SALE OF ORCHIDS in FLOWER and BUD will take place at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 17, at half-past 12 o'clock precisely, and he will be glad if Gentlemen desirous of ENTERING PLANTS FOR THIS SALE will send List not later than Thursday next.

On Monday Next, May 7.

Southend-on-Sea.

To FLORISTS, NURSERYMEN, and OTHERS.

MR. A. TALBOT is instructed by the Lessee to SELL by AUCTION, at the Royal Hotel, Southend, on SATURDAY, May 12, 1888, a 4 o'clock precisely, the Valuable long Leasehold NURSERY GROUNDS of about 1 acre, known as "Raven's" Nursery Gardens. The whole to be sold as a going concern. On the grounds are three LARGE GREENHOUSES, two of which are fitted with Hot-water Pipes (with numerous valves) heated from a Weeks' Tubular Boiler, capable of heating 30,000 feet of 4-inch piping; there is also a capital Glass Pit, two Potting-Houses, two Cemented Water Tanks to hold about 1200 and 1512 gallons respectively. The whole held upon lease for 50 years from December 25, 1854, at the low rental of £20 per annum, the estimated rental value being £90 per annum. The whole of the Trees, Plants, &c., in the ground to be included in the Sale, the Purchaser to have the option of taking the choice and extensive stock of potted plants at a price to be quoted previous to the Sale.

Under instructions from the Freeholder, will be offered FOR SALE (immediately after above is sold), the FREEHOLDER'S INTEREST in the above-mentioned GROUNDS, GREENHOUSES, &c.

Descriptive Particulars, giving dimensions, &c., of Greenhouses, and Conditions of Sale, can be obtained of the Solicitors, Messrs. BRIGHTEN AND LEMON, 4, Bishopsgate Street Without, E.C., and at Southend, Essex; or of the Auctioneer, Auctioneer's Offices, next the Bank, High Street, Southend, Essex.

To Florists, Nurserymen, and Others.

At a nominal reserve.—Lewisham, Kent, 10 minutes' walk from Station.
COLLEGE PARK NURSERY, comprising nearly 3 acres, with 500 feet run of Glass (stocked with Carnations, Stephanotis, &c.), and an excellent Residence. Lease seventy years. Ground Rent, £55.

MR. WM. HOSKELL will SELL by AUCTION, at the Auction Mart, E.C., on THURSDAY, May 31, the above DESIRABLE PROPERTY, with the Goodwill of the Business, by order of the Proprietor, who is relinquishing, owing to ill-health. The Nursery is within easy reach of Covent Garden, and in the heart of a good residential district, and an excellent opportunity is offered for the acquisition of a business of a pleasant and profitable character.

Particulars of Messrs. HUGHES AND GLEADOW, Solicitors, 4, Gracechurch Street, E.C.; and of the Auctioneer, Farmingham and Gravesend.

Home Counties.

OLD ESTABLISHED GENERAL NURSERY BUSINESS. **MESSESS. PROTHEROE AND MORRIS** have for SALE by PRIVATE CONTRACT an Old Established General NURSERY BUSINESS requiring a capital of between £1000 or £5000. Specially recommended.

Gardeners' Chronicle.

SATURDAY, MAY 5, 1888.

INDIAN BOTANIC GARDENS.

THE hundredth Annual Report of the Royal Botanic Garden, Calcutta, is of much interest in the botanical world, not alone for what it contains, but also for the evidence it affords of the vitality and vigour of the institution, the primary object of which was to disseminate useful information respecting the vegetable products of the possessions of the "Company," and to introduce exotic plants of economic value.

Dr. George King, F.R.S., the present able Superintendent, gives, as has already been stated in these columns, a concise history of the foundation and progress of the Garden down to the present time; and the appendices show that the establishment was never conducted with greater activity. We might make some interesting extracts from the present Report, but our object now is to give a foreigner's view of the principal horticultural establishments in India.

Mr. Warburg roughly classes the gardens under three heads, according to their degree of scientific practical utility, as distinguished from purely pleasure-gardens, though no hard and fast line can be drawn, because some of the gardens are maintained partly for pleasure and partly for profit. There are only three real botanic gardens in India—we let Mr. Warburg speak for himself—namely, Calcutta, Madras,† and Saharanpore, unless we count the garden at Ganesh Khind, near Poona. Besides these, there is the botanic garden at Peradeniya in Ceylon, which, however, comes under the Colonial Office. Of the officially so-called botanical gardens, two were originally founded as such by far-seeing officials: Calcutta by General Kyd in 1786, and the Ceylon Garden by Sir Joseph Banks in 1810; the latter having been established at Peradeniya ever since 1821. The origin of the Saharanpore Garden in the North-West Provinces I did not ascertain [It was originally a pleasure-garden of the native princes, and when Lord Moira conquered the

* Chiefly from an article by O. Warburg in vol. xlv. of the *Botanische Zeitung*.

† Mr. Warburg refers here doubtless to the Madras Presidency, as the botanic garden is at Ootacamund in the Nilgiris, and not at Madras. It should be understood that we are only extracting passages from a rather long article.

Mahrattas he caused it to be transformed into a botanic garden; and the first superintendent was Dr. Govan (1816-23), who was succeeded by the better-known Dr. Royle, Dr. Falconer, and Dr. Jameson; and the gardens of Ootacamund and Singapore have passed through various stages before attaining their present condition. Of agricultural experimental gardens I am acquainted with those of Kaudesh (Bombay Presidency), Saidapet (near Madras), Nagpore (Central Provinces), and Hyderabad (in the Deccan).

There is also a horticultural garden in Lucknow, an agri-horticultural garden in Lahore (Punjab), and the beautiful garden at Madras belonging to an agri-horticultural society. Similar societies exist in Calcutta, Rangoon, and probably in other places; the first publishing a special journal.*

In almost every town where there is a considerable European population or garrison there are ornamental gardens or parks, called into existence by the demand, and almost necessity, for some such place for social recreation—riding, driving, and walking—in a tropical country, where many of the pleasures and amusements of our European towns cannot be enjoyed. Then there are numerous extensive and costly gardens belonging to the native princes and nobles.†

Respecting the gardens having a practical aim, we may be very concise, as their objects are much the same, subject only to the climatal differences of the various provinces, and consequently the kinds of plants that may be profitably cultivated within their several centres of activity. The manner in which these practical ends are attained consists on the one hand of experiments and trials in the acclimatisation of useful and ornamental exotic plants; and on the other hand of raising new and improved varieties of native plants; and when successful results follow, propagation on a large scale is practised for free distribution or sale. Thus, for instance, during the year 1884-85 the Calcutta Garden sent out 23,500 living plants to various places in India, and forty-two Wardian cases of plants to foreign countries. Further, some 3000 packets of seeds were distributed; yet the proceeds amounted to only 107½ rupees, because one of the principal functions of the Calcutta Garden is to provide the public gardens and pleasure-grounds with plants.

In the same year the Saharanpore Garden distributed as many as 42,000 plants, and 21,300 packets of seeds; whereof 31,400 plants, and 14,000 packets to private persons; the amount received being 8500 rupees. But ornamental plants, both as living plants and seeds, occupy the first position, while fruit trees, timber trees, and seeds of vegetables, take a secondary place.

The Singapore Garden sent out the large number of 163,000 living plants in 1884. These figures, however, are merely extracted as examples of what is done by the different establishments, and afford no idea of their relative importance, inasmuch as the number of plants distributed by each one is subject to the greatest fluctuations; in illustration of which it may be mentioned that the Sabaranpore Garden distributed 146,000 plants in 1882-83, against 42,000 in 1883-84; the difference being almost made up by 100,000 plants of *Agave*. Similarly in 1884 the Horticultural Gardens in Madras sold 100,000 plants of the Mauritius Hemp, *Fourcroya gigantea*.

As already observed, the nature of the work of the different gardens varies according to the requirements of each district. In many parts, especially in Ceylon, the Nilghirries, British Sikkim, the interests of European planters have to be considered first; in the Rice-growing districts of the Ganges, Malabar, and Ceylon, the things cultivated in the gardens and

plantations engage special attention. In Bengal, Jute, Indigo, and to some extent Opium; and in Central and Northern India improvements in the cultivation of cereals are of primary consideration; while in the Bombay Presidency, and some parts of Ceylon, Cotton is added thereto; often associated with the latter the sugar-yielding *Palm*, *Borassus flabelliformis*. For the dry regions of the Punjab it is a question of finding suitable woody plants for afforestation, as well as for the saline soil of the North-West Provinces, in order to provide fuel for the agricultural districts, and thereby gain the dung of cattle for purposes of manuring. And among other things of vast importance is the conservation and renewal of the rapidly disappearing Caoutchouc forests of Malacca.

The Singapore Garden has only been a scientific establishment since 1882, when it was placed under the direction of Mr. Cantley; but much has been done in these few years without destroying the natural beauties of the old garden. A small herbarium has been formed, and the most necessary buildings erected. The new plantations are, as far as possible, systematically grouped. A special charm of this garden is a remnant of the original forest, traversed only by a few paths, where one can enjoy, in a small way, the delights of tropical vegetation without the fatigue attending excursions in pathless forests. The Fern garden and the palmetum promise to be very rich and attractive; but a larger income is necessary to carry out the functions of a botanic garden fully and expeditiously. It is perhaps superfluous to add that the director has to superintend the gardens and promenades of the town; but in order to understand the whole of the circumstances it is important to bear in mind that he has also been placed at the head of the newly created Forest Department for the whole of the Straits Settlements—an arrangement which of course causes him no inconsiderable amount of additional labour.

Seeds and plants are continuously being distributed from Kew, where all new things are reported and presented, and where competent authorities are consulted on the merits of the samples sent in. At this centre advice is sought, and there is a constant interchange of ideas and experiences between it and the Indian establishments, the advantages of which are so evident that it is unnecessary to enumerate them.

With the exception of Rice, tropical cultivation generally is so uncertain and subject to fluctuation, owing to the conditions of labour, communication, and credit, that improvements are very slow; and the experimental work is not so systematically conducted as with us. There are too few officers, and everybody has too much to do; nevertheless, many of the reports exhibit an amount of zeal and industry deserving of all the more recognition on account of the difficulties under which much of the work is done.

From this point Mr. Warburg explains and describes in some detail what has been effected by the combined action of Kew and the Indian botanic gardens in the introduction, resulting in the extensive cultivation, of economic plants of the first importance, such as *Cinchona*, Tea, and Coffee, the cultivation and manufacture of which have developed into industries of incalculable value. He further alludes to the cultivation of rubber trees, *Ipecacuanha*, fibre-yielding plants, &c., which is, in many instances, still in a more or less experimental stage. He also enters into particulars and comparisons of the climate of different districts in its relations to cultivation, and altogether his report is an interesting and instructive one, containing much information new to the English public. He specially mentions the great interest taken in the Madras gardens by Sir Mount Stuart Grant-Duff, and the material assistance he extended to Prof. Lawson. And he concludes with a brief review of the literature directly or indirectly connected with the botanic gardens of India, culminating in Sir Joseph Hooker's gigantic undertaking, *The Flora of British India*. With

regard to the intimate connection between Kew and the colonial and Indian gardens, Mr. Warburg thinks it is at present most beneficial, though he looks forward to the time when they shall have developed so far as to be less dependent on a central institution. *Nature*.

NOTES FROM BELGIAN NURSERIES.

(Continued from p. 524.)

L'HORTICULTURE INTERNATIONALE, PARC LEOPOLD, BRUSSELS (fig. 73).—This "Société Anonyme," founded March 1, 1887, with M. Lucien Linden for Director, M. Van Lansberge, President, and among the members such well-known names as M. le Baron de Bleichröder, M. le Comte Adrien d'Oultremont, M. E. Otelet, and M. G. Warocque, and with the assistance of the counsel of the veteran M. J. Linden, has made such rapid progress that already extensive premises have been built and stocked with good things, so that in the short space of time since the project was launched the resources of the establishment in pursuance of its object are well demonstrated, and the efficiency of the Director, who must have been heavily weighted in the gigantic undertaking, clearly proven. The main object of the Society is the introduction, purchase, cultivation, and sale of new and rare plants, and the exploration of all the countries of the world likely to give to horticulture new and rare plants, and especially those first favourites of the day, the Orchids.

The construction of the establishment was commenced in July, 1887, and finished in February, 1888; since that it has been stocked, and the formal opening is fixed for May 10, 1888. A reference to the view of the place here given will serve to give an idea of its general arrangement, which is so compact that every house can be visited without going once into the open air. At one end a workmen's gallery, 300 feet in length, serves for the storage of potting materials for use, for potting and other work; along the middle runs the lofty central gallery, furnished with noble Palms, Tree Ferns, and other rare plants, which may be inspected from the pavilion in the centre while the visitor rests. Near by is the exhibition-house for rare Orchids and other plants in flower, and out of the central gallery run the neat ranges of span-roofed houses of two or three divisions each, the one end terminating on the very edge of the fine Parc Leopold; and thus on all sides the establishment is well situated for open space and pure air, so necessary to plant life.

In the numerous houses devoted to Orchids we found a fine lot of *Odontoglossum crispum* and *O. Pescatorei* in flower, together with numerous things which we in England consider of ordinary interest and therefore unnecessary to note in an establishment where so many treasures are to be found—we noted some good examples of the handsome *Odontoglossum Luciani* which has much the appearance of an *O. ramosissimum*, natural hybrid; *O. triumphans*, Linden's variety, a grand thing; some good *Phalæopsis* and *Masdevallias*; *Vanda lamellata* *Boxalli* *superba*, a wonderfully beautiful variety with large well-rounded flowers of high colour; *Cypripedium Rothschildianum* and *C. præstans*, two new and superb things; and among them some others in bud which will probably prove quite new; *C. cardinalis*, *C. Argus* *multicolor*, *C. A. Boddartii*, *C. Druryi*, *C. Hookeri*, *C. porphyreum*, *C. barbatum* *Warnerii*, and others of the 200 or more species or varieties of *Cypripedium* of which the collection boasts. In flower, too, was *Oncidium flabelliferum*, among an importation of it. It appears near to *O. Gardneri* or *O. cartum*, and is doubtless the plant referred to in *Folia Orchidacea*, although some authorities put it into *O. prætextum*; *Dendrobium streblœceras* *Rossianum*, with white flowers, with two of the segments curiously erected and spiral, after the manner of *D. stratiotes*; *Eria striolata*, a good-looking plant, but not showy in flower; the true old *Masdevallia Lindenii*, the earliest flowering and brightest mauve.

* And we may add that there is an experimental garden in the mountains at Mussoorie in connection with Saharanpore; another at Darjeeling, partly pleasure and partly practical; and an important experimental garden at Monpoo (Sikkim), under Mr. J. Gamble: the two last offshoots of Calcutta.

† We must pass on to what Mr. Warburg has to say concerning the conditions and functions of the botanical gardens and their adjuncts.

FIG. 73.—ARCHITECTURE INTERNATIONALE, PARC LEOPOLD, BRUSSELS. (SEE P. 552.)

Among large batches of noteworthy Orchids not in flower we found a great quantity of the wonderful ivory-white *Catasetum Bungeorothi*, *Cattleya Bungeorothi*, a presumably new white *Cattleya*; and a white *Sobralia*; a large quantity of certified plants of white *Cattleya Mossiae*, *Sobralia Elizabethæ*, some novelties in New Guinea *Dendrobies*, the extremely rare *D. Macfarlanei*, and its rose variety as nearly as can be judged without seeing the flowers; *Acacallis cyanea*, a pretty blue Orchid, and *Ansellia congensis*.

The *Nepenthes*-house has about 3000 plants, some new, and some very rare; among the latter may be mentioned the fine *N. Lowii*. *Bromeliads*, too, are extensively grown, and those who cultivate them may find many rare specimens; as yet we in England are not educated up to them, although on the Continent they are much sought after, and probably chiefly because they are durable subjects for indoor decoration. Among them we noted *Massangea aurea* and *Caraguata cardinalis*.

New and rare plants have some worthy things among them, such as *Cordylone indivisa quadricolor*, a red, white, and green variegated kind; *Alocasia Luciani*, of noble habit; *A. Lindenii*, with yellow main nervures; *Phyllotenum Lindenii magnificum*, a great improvement on the pretty and useful old species; *Anthurium Scherzerianum bruxellesiense*, with dark scarlet spathes; *Acalypha triumphans*, finely marbled with red. A new blue flowered *Primula* (Edmond Morren) of great excellence occupies a house, and looks very attractive set up with Maidenhair Fern. Among the plants recently introduced the beautiful gold and green *Dracena Lindenii* is the most attractive and useful.

Palms are grown in large quantities, and by importation of seeds from new districts it is hoped to bring to our gardens many new things. Among other good batches we noted *Livistonia rotundifolia*, *Thrinax graminifolia*, *Pinanga*, *n. sp.*, *Kentia elegantissima*, *Enterpe montana*, &c.

In the central avenue of Palms stands a huge and interesting specimen of *Livistonia sinensis* of great interest on account of its being the original plant which Siebold brought from Japan, and which was then named *Corypha Sieboldii*. The trunk, which is over 2 feet in diameter, tells plainly of the lapse of time since as a little plant it was brought home to Europe. *Cycas tonquinensis*, also of great stature, shows that noble plant in its true character; there are also large specimens of numerous other rare Palms, Cycads, and Tree Ferns.

The heating is cleverly done from one point by three large heating apparatus working all together or alone, as may be desired, the arrangement being very effective and economical. The *Société l'horticulture Internationale* has a large undertaking in hand, but with its able management and resources it will doubtless prove a great success.

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

ERIA STRIOLATA, *n. sp.**

This is very like *Eria stellata*, Lindl. It has shorter, broader, and stouter leaves. The raceme is very dense, and the thick rachis has scarcely any hairs. The sepals and petals are light ochre-coloured, striped with reddish-purple, petals with only one, sepals with three stripes. Lip ligulate, with very blunt side-lobes, and with three conspicuous, partly crenulate yellow keels. It was imported from the Papuan Islands by Messrs. Linden, of Brussels. *H. G. Rehb. f.*

* *Eria striolata*, *n. sp.*—Aff. *Eria stellata*, Lindl.: pseudobulbus —; foliis cuneato oblongis acutis valde carnosis; racemi rachis crassa minutissime barbata, densiflora; bracteis ovatis acutis transversis ovaria subaequantibus cito deciduis; ovaris minute hispidulis; mentis obtusangulis; sepalis lineariligulatis acutis; extus parce hispidulis, lateralibus deflexo curvatis; tepalis lineariligulatis n. utis, labello ligulato trilobo, tricuspidato. *H. G. Rehb. f.*

DENDROBIUM NOBILE (Lindl.) SANDERIANUM, *n. var.*

This was introduced by Mr. F. Sander four years ago. It has now flowered three times, and it has always kept its full grandeur. The flowers are of a dazzling purple, and the reticulation of transverse nerves is very strong. The mid-line of the mentum is green; the whole disc of the lip is covered by a grand dark blotch, and all around it is rosy-purple, only leaving a small white area in front, traversed by purple veins, and with a white border to the superior part. All the petals I saw were white at the base.

I have to thank Sir Trevor Lawrence for the opportunity of comparing specimens of *Dendrobium nobile nobilium* with this. That lovely plant has all the parts narrower and longer, and the petals purple at the base inside. The lip is much narrower. *Dendrobium nobile Sanderianum* would appear to be very free-flowering. *H. G. Rehb. f.*

DENDROBIUM MURRHINIACUM X, *n. hybr.*, Angl.

This fine thing was kindly sent me by Mr. R. H. Measures from Streatham. It is stated to be a cross between *Dendrobium nobile* (♂) and *D. Wardianum*. "In growth the stems would readily be taken for those of *D. Wardianum*, as they are so much alike." Though *D. nobile* is the pollen parent, the flowers, especially as regards the petals, are in shape very much like those of *D. Wardianum*. The flower is equal to that of a good *D. Wardianum*, snow-white with purple tips to the petals and sepals. The lip has a large purple obovate blotch at the base of the disc, with some lateral darker stripes and a light purple apex. The mentum has a green line in the middle. Column green. Anther purple. Stalked ovary light green. The dried flowers show the anterior suberulous disc of the lip sulphur, although it was nearly white while the flowers were fresh. I proposed the name *murrhiniacum* as the fresh shining flowers looked quite as if made of good "meissen." [*Murtha* is supposed to have been floor-spar.] *H. G. Rehb. f.*

PHALENOPSIS OLORIOSA, *n. sp.*

This might at first sight be taken for *amabilis*, Lindl., but the callus is totally distinct, narrow, deep, blunt bilentate at the apex. Side laciniae of the lip with very short stalk. Flowers very conspicuous, set closely, "white of *Phalenopsis amabilis*." Leaves quite blunt, and broad at the apex, even blunter than in *amabilis*, light green on both sides, "now slightly silvered on the upper surface."

Just at a period when the old *Phalenopsis* are dead, and when there are very few fresh ones in the market, Mr. Stuart Low introduces a glorious rival of the two oldest species. It is not like *Phalenopsis amabilis* in its flowers, nor like *grandiflora* in its leaves. Mr. Stuart Low sent me three good inflorescences, a very good living plant, some extra leaves; and last, not least, a very accurate description—the first I have obtained from Mr. S. Low after twenty-six years' correspondence. The remarks I quote from Mr. Low are enclosed in quotation marks. *H. G. Rehb. f.*

CYPRIPEDIUM ROTHSCHILDIANUM.

I have just received from Mr. F. Sander a quite fresh and fine inflorescence of this novelty with very good bracts; the first fresh specimen I saw had them in an inferior condition, as is often the case in newly-introduced plants. They are light yellowish-green, oblongo-ligulate, both halves touching one another, tridentate at the apex, with eleven blackish Indian-purple lines and a ciliate margin. The ovary is of a bluish-green colour, and its ribs and its apical part are Indian-purple. The flower resembles the wild one as regards size. *H. G. Rehb. f.*

HYBRID PALM.—A hybrid has been obtained at Cannes between the Date Palm, *Phoenix dactylifera*, and *P. canariensis*. Its growth is rapid and its fruit edible, which is not the case with the fruits of either parent as grown in the South of France.

THE ALPINE GARDEN.

ALYSSUM PYRENAICUM.

This charming little alpine, of which I saw a quantity of plants in blossom (in pots) at the York Nurseries on Saturday last, will probably become a great favourite with all who have a rockery. The habit of the plant is neat, while the blossoms are delicate white, and are produced in great profusion—in fact, I should imagine that when the plant is well established it would be quite hidden by the abundance of bloom. I examined two specimens on a raised bed on which the bloom promised in a few weeks (it is dangerous to prophesy as to dates this season) to be much thicker than on the plants in pots. To me the pleasant fragrance of the flowers was an additional attraction. *North-Easter, April 9.*

TWO BEAUTIFUL ANEMONES.

The two earliest flowering and, in my opinion, as pretty as any species belonging to the same genus, are now at their best, and merit a passing word of comment. *A. apennina* has flowers of a cerulean-blue colour, borne on stems 9 to 12 inches high, with a whorl of three leaves united at their base, distant from the flower 3—4 inches. When seen in large patches, as is the case here in a wood [and just now at Kew], one cannot help regretting that so bright a flower is not more frequently met with. We have sometimes read of a blue variety of *A. nemorosa*, but have doubts about it, and think it quite possible that the above species may have been so regarded. *A. ranunculoides* is a worthy companion to *A. apennina*, and is of a deep golden-yellow colour, the flowers equally attractive, especially when seen glistening in the sunshine. The flowers are but half the size of *A. apennina*. Both species delight in a well-drained chalky soil, and do best when under the partial shade of trees. They should be extensively planted near woodland walks that are contiguous to the kept grounds. *J. H.*

VARIETY OF COLOUR IN FLOWERS OF GENTIANA ACAULIS.

I had no idea of the beauty of some of the varieties of *Gentiana acaulis* (*Gentianella*) until they lately bloomed at Oakwood; the gorgeous blue of the type, especially when grown in full sunshine, might make it seem that any change in colour would be a step in the wrong direction; but in this case, as the varieties are all of delicate tints of colour, no comparison is provoked. My son, Mr. Scott Wilson, while studying Swiss birds in 1885 and 1886, did not forget the Wisley garden, and when among the *Gentianellas*, collected those of abnormal colours and sent them home. They are now established, and, though small plants, are blooming well. One is pale azure-blue; another white, faintly tinted with pale-blue; another white tinted with pink-purple, the reverse of the throat being a full pink-purple. An artist friend has taken their portraits. *George F. Wilson.*

PLANTS IN FLOWER AT MESSRS. BACKHOUSE'S NURSERY.

The few days of spring weather we have lately experienced have brought forward vegetation in a marked degree. When looking over the rich collection of alpine and herbaceous plants at the York Nurseries one cannot help being struck with the great number of rare and interesting plants there brought together; my object now, however, is rather to note a few varieties. For instance, the plant to which my attention was first drawn was *Rhododendron lapponicum*, a rarely seen plant which is here nicely in flower. This arctic shrub was first introduced in the year 1810, and re-introduced by Mr. Backhouse eight or ten years ago. It forms twiggy tufts a few inches high: the blossoms, clear rose-pink, are about half an inch in diameter. It is by no means difficult to cultivate if planted in fibry peat, with sand or millstone grit.

Daphne Blagayana is growing in an open bed inclined to the north, and was in full flower; it has large globose heads, composed of from twenty to twenty-

five creamy-white fragrant flowers. Of the large collection of *Androsaces* found here I noticed in blossom the following species:—*A. argentea*, with white flowers, which appear to rest upon the miniature tufts of silvery leaves; *A. brigantica*, which resembles a white *A. carnea*; it is, however, considered a species. Of those with pink or rose coloured flowers *A. carnea*, *A. carnea* var. *eximia*, and *A. ciliata* were noticed; the last-named is perhaps the most compact and the most showy of the genus. *A. vitaliana* was also noticed; it has brilliant golden-yellow flowers. *Ramondia pyrenaica* var. *alba* was pointed out as a choice variety; the blossoms are quite as large as those of the type, and of snowy whiteness. It ought to be mentioned that this was protected with glass, or it would not yet have been in flower. Near to the last-named was *Ramondia serbica*, a new and distinct species; the flowers are 1 to 1½ inch in diameter, saucer-shaped, firm in texture, of a soft, delicate rosy-purple. In the same frame *Haberlea rhodopensis* was remarkably fine. The flowers are about the size and similar in shape to those of *Mimulus luteus*; the internal portion is white suffused with rose; throat prettily spotted with deep purple; the upper external portion of the tube is rosy-purple, thus presenting a pleasing contrast of colours. It is a plant which evidently requires for its successful growth a moist atmosphere, and should be planted in peat and sand in well-drained fissures. *Saxifraga Boydii*, *S. sancta*, *S. caryophylla*, and several others, were noticed. *S. Boydii*, with its clusters of sulphur-yellow flowers, is very distinct, and should, I think, become popular in time. *Alyssum pyrenaicum* is a rare plant, with clusters of snow-white flowers, and bears some general resemblance to *Thlaspi rotundifolia*, the plant being about the same height, with blossoms of the like size, the main difference being in the colour, *T. rotundifolia* having flowers of rosy-pink. To all appearance the *Alyssum* will prove much the more easily managed plant. I noticed several which have been planted out for some years without protection, and these are a complete mass of flower-buds, and form a perfect cushion of thickly clustered flowers. Of the alpine *Primulas* I scarcely dare to speak, they are so numerous, and are here in such vigorous health, which shows how they revel in the moist atmosphere of the district.

Another plant I saw in the open beds, and also on the rockery, was *Pulmonaria arvernensis*, a plant with flowers of a deep blue colour. It is a valuable addition to flowering alpine at this season; in fact, I know no other *Pulmonaria* of the same depth of colour, or which is so good as a decorative plant.

Messrs. Backhouse & Son have of late years paid some attention to getting together a collection of *Fritillaria*; I was, however, too early to see them, excepting one or two species. *F. Moggridgei* was in fine condition, with hundreds of its large drooping golden-yellow blossoms; both in the open beds and also in pots, *F. recurva*, *F. Burnettii*, *F. pudica*, *F. messenensis*, and *F. latifolia* were coming nicely forward. *Holgate*.

PLANTING GROWING VINES.

As described by me in the *Gardener's Chronicle*, October 15, 1887, as soon as the young Vines which have been raised and properly attended to from the period of resting them, have attained a height of 2½ feet, they may be planted as follows:—Make the necessary number of holes 2 feet apart, beginning at 2 feet from the end, between the front wall and the hot-water pipes, the entire length of the border. Then have a sufficient complement of rather fine soil of about the same warmth as that in which the young Vines are growing to put around them when being planted, so as to prevent the plants from experiencing any check in consequence of the roots coming in contact with a compost less warm than that in which they are growing. Turn the Vines carefully out of the pots, and plant

them—the permanent rods mid-way between the rafters and those for yielding a crop of fruit next year between them—about one inch deeper than they were in the pots, disturbing the roots as little as possible, and making the soil firm about them in planting. Then put a stick to each plant for support, and secure them to the trellis, but leave them sufficiently long, and the ties loose, to admit of their subsiding 6 or 7 inches with the soil. This done, give sufficient tepid water through a rose to settle the soil about the roots, and afterwards lay on a surface-dressing of 2 or 3 inches thick of horse-droppings or decayed manure. In the event of cut-back Vines—that is, Vines one-year old—being planted, it will be necessary, unless they were shaken out, the roots shortened a little and re-potted some six weeks' since, to disentangle the roots, cut the latter back to within 15 inches of their base, and then spread them in every direction over the soil with a slight inclination downwards; cover with 6 inches thick of soil, and water, &c., as indicated above.

TEMPERATURE AND ATMOSPHERIC MOISTURE.

Keep the water in the pipes sufficiently warm to maintain a night temperature of 60°, and 70° by day, raising it to 85° with sun-heat and a free circulation of fresh air, and run the temperature up to 90° at closing time, with abundance of atmospheric moisture. The Vines and house generally, especially underneath and between the hot-water pipes and the wall, should, in addition to the distribution of moisture in the afternoon at closing time, be syringed with tepid water the first thing in the morning, and during bright sunny days the surface of the border and the pathway should also be damped about mid-day.

VENTILATION.

The time for admitting fresh air in the morning and excluding it in the afternoon must be regulated in accordance with the weather at the time, as the temperature recorded in each house, and not the particular hour or minute, should be the guide in this important matter; therefore the ventilators should be slightly opened as soon as the thermometer registers 80° on bright mornings, afterwards increasing and decreasing the supply of air with the rise and fall of the temperature, which should be maintained at 85° from mid-day until closing time. This should be varied from 3 o'clock in the afternoon to a quarter past during the next few weeks; the ventilators should, however, be opened slightly late each evening and closed early in the morning, when the Vines and the house, as already indicated, should be well syringed. *H. W. Ward, Longford Castle.*

PLANT DISEASES.

SMUT (USTILAGO SEGETUM) IN OATS AND BARLEY.

From an extensive series of observations and experiments carried on during the past two years, with the smut fungus (*Ustilago segetum*) in Denmark, it appears, that although the spores of this fungus are its reproductive bodies, yet:—

(1). Very large quantities of the living spores, adhering to the outside of Oats and Barley are as a rule incapable, to any appreciable degree, of infecting the young plants.

(2). The spores which have fallen upon the ground in an affected field during the summer are incapable of infecting, to any appreciable degree, the young plants of Oats or Barley grown in this field the following season.

(3). The same is true of farmyard manure, the excreta of herbivorous animals, contrary to the assertions of Brefeld.

(4). The reproduction of *Ustilago segetum* in Oats and Barley is due entirely, or nearly so, to the spores present between the chaff and the grain. The spores gain admission here in great numbers shortly after the ears have appeared, namely, during the flower-

ing of the plants, when the florets have opened to allow the stamens and pistils to be protruded for the purposes of fertilisation. Great numbers of the spores adhere to the pistils, to which they have as easy access as the pollen. Hence we find, as a matter of fact, that the spores of *U. segetum* are developed in the greatest profusion at the time the plants themselves are blossoming.

At one time I was inclined to believe that the spores or sporidia (secondary spores), when they had gained an entrance into the flower inside the glumelles emitted germ tubes which entered the kernel while it was still soft and green, where they remained in a state of quiescence without causing any appreciable injury to the corn until the following year, when the corn germinated, and thus the young plants became infected. I am not certain that this supposition is incorrect, but if it be so then the infection must take place in spring from spores present between the chaff and kernel. During the coming season I hope definitely to clear this point up. But if infection takes place in spring from spores lodged between the chaff and the kernel, then one would think it would be easy artificially to infect plants by removing the chaff and placing the spores on the naked kernel; indeed, one experiment of mine points in this direction, but it is not quite reliable. Again, to some extent Oats might be infected without removing the chaff by dipping in spore-charged water, because it is easily conceivable that when the water enters the space between the chaff and the kernel some spores at least would be carried in with it; but on the other hand, with Barley this cannot happen, as the chaff is united with the kernel.

Besides these theoretical conclusions I have conducted a number of experiments with a view of preventing the disease. Although I have been unable artificially to infect Barley and Oats with *Ustilago segetum* yet by employing seed from fields badly affected with smut, by the aid of control plants the following results have been obtained:—

(A.) Smut (*Ustilago segetum*) in Oats may be easily prevented by steeping the seed-corn in a quarter per cent. of a solution of sulphate of copper, or by using a mixture of 1½ lb. of sulphuric acid in 100 lb. of water. But the plants themselves suffer considerably by this treatment. Quicklime and common salt were also tried with considerable advantage, but a thorough disinfection of the seed corn by this means was far from being obtained.

(B.) Curiously enough smut in Barley could not be sensibly diminished by either the use of solution of the copper sulphate nor of the sulphuric acid double the strength of those mentioned above as being completely successful with Oats. Still it was found that all the spores external to the grain had their vitality destroyed. Hence we must conclude that the infective medium is internal not external to the covering of the seed corn. In Oats the spores were killed both internally and externally, but in Barley those inside the covering of the seed were not destroyed, owing to the impossibility of the solution reaching them except by soaking through the covering of the seed. But it is a well-known fact that in the osmosis which thus took place the fluid which passed through the stout membrane covering the Barley would contain much less of the copper salt than the solution originally did. In the case of Oats, however, the solution would enter through the cleft in the glumelles, and would therefore have its activity unimpaired, and would come directly into contact with the spores inside the glumelles.

(C.) Practically, the disinfection of heat was found to be not only more efficacious, but also easy of application.

The spores of *Ustilago segetum* of Oats and Barley are killed by the action of water at a temperature of 56° C. (= 133° F.) in the course of two or three minutes.

A sample of Oats was divided into two portions, one was immersed in water at 56° C. for five minutes, the other was not. The first produced no blighted ears, but of the latter 38 per cent. were smutted. Moreover, the germinative faculty of one

seed was not in any degree impaired, and the plants produced were equally vigorous and strong. An almost similar result was obtained with water at 52° C. Barley, on the other hand, gave a somewhat different result, for although this treatment killed all the spores which were adhering externally to the seed corn, yet the number of smutted plants was not sensibly diminished. This is probably accounted for by the spores beneath the outer coat of the Barley not getting wet, so that they were subjected to a dry heat only. It was found that subjecting the spores to a dry heat of the same degree (56° C.) for a period of five to seven hours did not destroy their vitality, nor did it prevent the blight. It is very possible that if the Barley had been moistened for twenty-four hours, and then subjected to a temperature of 45° C. for five minutes, the desired result would have been attained.

The method of thus disinfecting seed corn by moist heat is easily carried out in practice, and it is the only one at present known which does not damage the germinative power of the seed, and the vitality of the plants. The seed to be disinfected was placed in a basket lined with coarse cloth, and dipped for the required time in water of the proper temperature. It may be added, that Wheat treated in the same way, namely, by immersion in water at 56° C., was completely protected from bunt (*Tilletia tritici*), not a single ear being affected, although 15 per cent. of the central sample was diseased.

It is probable that Rye in the same manner may be equally easily protected from *Urocystis occulta*, which in Denmark not infrequently affects 10 to 15 per cent. of the plants in the fields, although it is often overlooked by the agriculturist. *C. B. P.*

THE HERBACEOUS BORDER.

CORYDALIS TUBEROSA VAR. ALBA.

This seems to be the proper name for this plant, now flowering in the alpine-house at Kew, and which will be found in gardens under the names of *C. cava* var. *alba*, *C. bulbosa* *alba*, *C. Marshalliana*, &c. The latter is a nearly allied plant, differing chiefly in the laxer inflorescence and more deeply cut leaflets. It is also nearly allied to *pallidiflora*, a Caucasian plant of merit. The above plant is quite as hardy as *C. solida*, and infinitely more beautiful and useful for outdoors in the early spring season. The flowers are borne in dense spikes, large pure white, carried well above the pretty *Adiantum*-like foliage. *C. bracteata*, a native of the Altai Mountains, is also in flower just now, and we find it equally hardy with the above. It is said to have been first flowered at the Botanical Garden, Birmingham, the tubers having been sent home by Professor Ledebour when collecting in the Altai Mountains. It is dwarfer and more compact in habit than the above, the flowers of a uniform pale yellow, the lip emarginate, and usually with a mucro in the notch. *D.*

SAXIFRAGA MACROPETALA.

This remarkable plant belongs to the section *Porphyron*, which includes *S. oppositifolia*, *biflora* *retusa*, &c. It is found growing near *S. biflora*, and although it is to all appearance exactly intermediate between the latter and *S. oppositifolia*, it has been considered specifically distinct by Kerner, who first described it under the characteristic name given above. Like *S. oppositifolia*, the leaves on the flowering-stems are densely crowded and overlapping, the internodes gradually lengthening until the flower appears, when they are often widely apart. The lower leaves are roundish, or wedge-shaped, and about as broad as long; those on the upper part of the stem longer than broad, slightly ciliate, and having a remarkable obtuse apex, pitted as we see in some of the above species. The flowers are as large as, and somewhat resemble, those of *S. oppositifolia*; the petals are deep lilac, about 4 lines long and 2 broad. The pretty red anthers open alternately, the first five several days before the others

are ready to burst. It has a curious ring-like disc round the base of the ovary; and this character, we believe, is confined to *S. biflora*. In Dr. Engler's Monograph *S. Kochii* is placed as a synonym of the above, but in a note he says that the description given by Hornung leaves a doubt whether the plants are identical. Hornung, in his description, however, remarks that his plant differs from *S. biflora* by its narrower leaves. In the note referred to, the similarity of this plant to several true hybrids between *S. oppositifolia* and *S. biflora* is admitted,

ERYTHRONIUM ALBIFLORUM.

Mr. WARE sends us flowers of this beautiful hardy Dog's-tooth Violet, a native of North-west America. There seems a good deal of confusion as to the names of these beautiful plants, the fact being, that the species are very variable, and that distinct names have been given to mere local varieties. The fullest notice of these plants that we are aware of was contributed to the Scientific Committee of the Royal Horticultural Society by the

FIG. 71.—ERYTHRONIUM GIGANTEUM VAR. ALBIFLORUM.

although *S. macropetala* is not considered identical with them, owing chiefly to the broad ring-like disc. As a garden plant it may be considered inferior to both the above named species, but it is interesting owing to its intermediate characters. It is a native of Tyrol, &c. In flower now at Kew. *D. D.*

DR. PANCIC, the Director of the Botanic Gardens and Professor of Botany at Belgrade, died on March 8, aged seventy-four. Dr. Pancic was known for his collections of European plants, and was the first to make known the remarkable *Picea omorika*, figured in these columns.

late Mr. Andrew Murray, and whose paper will be found printed in full in our columns for June 27, 1874. Mr. Murray there points out, from investigation of the plants in their native land, that in the same locality much variation exists, that *E. grandiflorum* var. *minor* of Hooker, *Bot. Rey.*, t. 1786, and *E. grandiflorum* var. *giganteum* of Hooker are one and the same specifically. The variety *E. grandiflorum* var. *albiflorum* has white flowers growing singly (*Gartenflora*, Aug. 1873, p. 227), while the var. *maculatum* only differs from the last-mentioned in having the leaves blotched.

Murray mentions numerous other varieties, but concludes that they are all forms of one species differing in stature, in the spotting of the leaves, and in the

number and colour of the flowers. While the flowers are thus variable the bulb characters are more constant, the bulb being narrow, spindle-shaped, and giving off roots, not at the base of the bulb, but one-third of the way up. Sereno Watson (*Botany of California*, i, p. 170) apparently had no cognisance of Murray's notes, though he points out the necessity for a comparison of the ripe seed-vessels and bulbs. Mr. Ware finds the form he sends us, with maculate leaves and large white flowers, the best of the series; and recommends it to be cultivated in moderately heavy soil, and in a partly shaded situation.

NATAL NOTES.

DISPERIS FANNINLE.—This lovely little terrestrial Orchid is one of the most curious and delicate of the genus, over twelve species of which

remarkable for its radical brown spotted leaves and clustered tuberous roots, which delight to attach themselves to blocks of moss-covered sandstone. The stem is 9 inches to a foot high, and bears a dozen minute but very pretty pale purple flowers. No doubt it would thrive on blocks of rock in a cool fernery, as one sees it in such places here in company with the white *Begonia geranioides* and orange *B. natalensis*.

ARISTEA ECKLONI.

Some fourteen species of *Aristea* have been noted as growing in Southern Africa, and out of four or five distinct forms I have met with here, *A. Eckloni* is the best one. The plant is a fibrous-rooted Irid, 2 to 2½ feet high, with narrow leaves, and a many-branched inflorescence. The flowers are rather more than a quarter of an inch across, and of an intense rich blue colour. The individual blooms are

Transvaal, and since then from Zululand, where it also grows, have all died.

Returning to *Xerophyta elegans*. This is an herbaceous, fibrous-rooted trailing perennial, found growing out of the crevices of sandstone cliffs at elevations of 4000—5000 feet. Its long stems, clothed with deep green leaves, hang over the edges of inaccessible precipices, and are in early summer plentifully besprinkled with drooping, long-stalked, snow-white, flowers about half an inch across. It bears transplanting well, and for soil likes a very well drained fibrous peat. Doubtless it would make a good subject for growing in hanging baskets, and the temperature of a cool or intermediate-house will be found to suit it best.

VALLOTA PURPUREA MINOR.

A well marked variety of this beautiful plant. Herbert, in his *Amaryllidaceae*, mentions a dwarf form (*Amaryllis purpurea*, *Botanical Register*, t. 552), which, he says, has paler flowers than the type, but our variety has the same glowing scarlet flowers of nearly the same size as *V. purpurea*, the whole plant, however, being much dwarfer. Stem 6 to 9 inches high, bearing in spring two flowers. A very desirable thing for forcing, to be used in conservatory decoration, or for cutting from. Soil, well drained peat and leaf-mould, plenty of water when growing and flowering, thereafter a rest will be found to suit it well. *R. W. Adam, Maritzburg, Natal.*

NEW PLANTS AT THE GHENT SHOW.

Among these were *Begonia Lubbersi*, already figured by us at p. 300, and which is thoroughly distinct from *B. argyrostigma* and *Dichorisandra pubescens* var. *teniensis*, the latter of which we now give an illustration of (fig. 75)—a stove plant, introduced from Brazil, and which has broad lanceolate leaves of a rich green colour, prettily striped with silvery bands on the upper surface. As seen in Ghent, in M. Pynaert's nurseries, and also on the exhibition table, there is no doubt that this is a useful introduction, which will be sought after by the connoisseur of fine-foliage plants; and there is every probability that it will develop its good qualities under cultivation. The flowers, of a pretty blue and white colour, are borne in racemes on the end of the stem. It differs materially from the plant introduced by Linden some years ago from the Amazon region, under the name of *D. vittata*. Ordinary stove culture and a moderately rich light soil suit the plant.

ROSES.

TWO GOOD ROSES FOR EARLY FORCING.

The two Roses, *Fortune's Yellow* and *William Allen Richardson*, stand in the front rank for growing in pots for early blooming. Some gardeners think the former will not bloom satisfactorily unless planted out in a house, and trained close to the glass. This is a mistaken idea, as it will bloom just as freely grown in a pot. The chief point in the successful blooming of these Roses is the thorough ripening of the wood. This year on starting the early vinery in January, I plunged one large plant of each of these two Roses in the fermenting bed of manure which was put into the house to aid the unsatisfactory heating apparatus, placing the shoots on the trellis to which the Vines are tied. They quickly started into growth, breaking at every joint of last season's wood, giving a bloom on each new shoot made. The plants remained in this position till the foliage of the Vines became so dense that it was no longer safe to leave them there. I then removed them to a lighter house, training them just under the glass, the temperature being kept at 45° to 65°, and here they remained till they had finished flowering.

From *Fortune's Yellow* I commenced to cut good

FIG. 75.—DICHORISANDRA PUBESCENS VAR. TENIENSIS: LEAVES SILVER-STRIPED: FLOWERS BLUE AND WHITE.

are natives of South Africa. Our plant may be briefly described as a herb 1 foot to 18 inches high, having tuberous roots as large as a thimble. Leaves clasping the stem. Flowers two to five to a spike, three-quarters of an inch across. The two lateral sepals are saccate, the odd upper sepal combining with the two lateral petals and forming a hood over the narrow upright labellum. Within the hood is the complicated column, bearing two pollen masses. Flowers snow-white, resembling an old-fashioned mob-cap! with a few faint purple dots on the petals. It is a very dainty little gem, flowering in late autumn, and found only at elevations of 3500—4000 feet in moist cool woods, growing in light leaf-mould. *Disperis* are hardly known in home collections. Professor Reichenbach once told me he had never seen a living plant.

STENOGLOTTIS FIMBRIATA.

well calls this a graceful little Orchid,

rather fugitive, but are produced in great numbers for several successive days. Delights in full exposure to the sun in moist but well-drained spots.

XEROPHYTA ELEGANS, Baker.

Although belonging to *Amaryllidaceae*, the above plant, and its relatives, are in habit quite unlike any other *Amaryllid* native to South Africa. In Bentham's *Genera Plantarum* *Xerophyta* is found under the head of *Vellozia*, of which some dozen species are known from this country. One very handsome species, possibly *X. equisetoides*, or *X. retinervis*, with the habit of a narrow-leaved *Draecena*, or small *Xanthorrhoea*, I found growing in the Transvaal, on quartz rocks, at an elevation of about 6000 feet. Stem branched, 3—4 feet; leaves very narrow, grass-like, drooping; flowers solitary, pendulous, pale purple.

I have sent home good seed of this fine novelty, but several stems I brought down from the

flowers less than eight weeks after starting the plants. The plants had not been forwarded previously, they having been stood out the whole season against a south wall, and from the beginning of November had merely received protection by having a mat placed over them in severe frost. The amount of bloom that can be obtained from large plants of these Roses grown in a pot is surprising, and the ease with which early flowers can be obtained makes these varieties invaluable to all who want early Roses. Few Roses are more beautiful in bud, and this is their chief merit, for, being too thin in petal, they are, when open, not of much value. The flowers that were shown at South Kensington on March 13 were from these plants. *Pro.*

NEW ROSES.

Messrs. Souper & Notting are sending out in May the following novelties in *Rosa polyantha*:—*Clara Pfitzer*, flower small, imbricated, light carmine marbling on a silver-white ground, fragrant and floriferous; *Hermine Madele*, flower small, double, of good form, colour creamy-white with a tinge of yellow, the centre is darker; *Princess Henriette de Flandre*, strong growing, flower small, double, nice form, colour salmon-pink with yellow, the centre nankin-yellow on crimson-yellow ground, fragrance that of Violets; *Princess Josephine de Flandre*, colour, carnation-rose on salmon-yellow ground, very sweet. The first, second, and fourth are of dwarf bushy habit; and all have been obtained by hybridising *Mignonette* with *Marquise de Vivens*. *Illustrierte Monatshefte für die Gesamt-Interessen des Gartenbauers*.

VEGETABLES.

HOW TO GET GOOD CROPS OF TOMATOS OUT-OF-DOORS.

The practice of transplanting young plants of Tomato from small pots at the end of May or early in June is faulty, and should be altered, inasmuch as the plants are, as a rule, cut down by autumn frosts before they have ripened off a good crop, and that which is secured is not commensurate with the labour bestowed on it. The first improvement in method is to get the plants established in 8½-inch pots, and with a fairly good crop of fruit already set before transplanting out-of-doors at the end of May. To do this a hotbed must be made use of in which to raise the plants from seed and grow them on for a couple of weeks, after they should be pricked out at 2 inches apart into shallow pans, and placed in a warm pit deep enough to allow the plants headroom when shifted into large pots. In the absence of such a pit an ordinary garden-frame can be raised on large flower-pots or bricks as the plants grow and require more head-room, meantime filling up the space between the ground and bottom of the frame with long dung or Fern, to keep the cold out. To resume: when the plants in the boxes or pans touch each other they should be potted singly into 3-inch pots, containing rich mould, returned to the frame, watered, and kept close for a few days; afterwards air should be admitted rather freely on fine days. As soon as the plants require more root-space shift them into 6-inch pots, again shifting them into 8½-inch pots before the roots have become matted. The soil for these shifts may consist of a mixture of four parts good loam and one of horse-droppings or leaf-mould. Give water at the roots to settle the soil about them, and afterwards allow the soil to get moderately dry before repeating the watering until the roots have permeated into all the soil, when more will become necessary. Stop the plants when they have attained to a height of 2 feet (sticks having been previously supplied to them for support) and the lateral growths, except one at the base on each side of the stem, should be pinched back to within one joint, and the compound leaves back to two joints, to admit of the light reaching the stems and shoots. The two shoots springing from the base of each plant should be secured to sticks near

the edge of the pot, and, like the parent stem, should be stopped when about 2 feet high, afterwards the secondary growths should also be stopped above each cluster of fruit grown. It will be necessary to cover up the frame with mats or Fern at night until a couple of weeks before planting out, when the glass will be sufficient protection from any frost likely to happen.

For a week or so previous to planting outside the plants must be ventilated more freely than heretofore. A position against south and west walls, boarded fences, or in the open in warm gardens is well adapted for the Tomato. This planting out, as already stated, should be done about the end of May, varying the time a week or ten days, according as the district and the weather at the time are warm or otherwise. In planting, open the necessary number of holes, mixing a few shovelfuls of short manure with the excavated soil; then, the plants being at the time quite moist at the roots, should be turned out of the pots, and carefully planted about the same depth in the soil as they were in the pots, pressing the soil about the roots in planting. Having secured the shoots, if on walls, &c., at 9 inches apart, surface-dress with short dung to the extent of 2 feet from the stems of the plants. This done, stick in the ground in front of each plant a Spruce or Laurel branch large enough to screen it from the effects of sun and frost. A few days after planting, when the roots will have pushed into the fresh soil, the boughs may be removed in the morning, and replaced in the evening for a week or two, after which time they may be removed altogether. If the summer should be a warm one, the plants must be kept well supplied at the roots with water, alternated with liquid manure.

The chief points to be attended to in the training of the plants are the thinning and stopping of the shoots and leaves at the proper time, as overcrowding is fatal to success. The pinching of the shoots and leaves, as indicated above, will expose the leading shoots and the fruit to the full influence of the sun, thereby reducing to a minimum the chances during an ordinary summer of the plants being attacked by disease. In support of this assertion, which I do not make for the first time in your pages, I may say that the discoloration and subsequent withering of shoots and leaves are to be attributed, when these symptoms appear during a dry warm summer, not to the epidemic, but to the overcrowding and consequent fermentation of the soft, sappy shoots and leaves. Plants cultivated in the manner described yield good supplies of fruit from the middle of July until destroyed by the frost, and the unripe fruits will gradually ripen in warm dry places up to Christmas. Large plants of Tomatos which are fruited in 10-inch pots during the months of May and June may, by gradually hardening them off prior to planting them in warm positions be made to bear heavy crops of excellent fruit until cut off by the frost. *W.*

ABERDEEN AGRICULTURAL RESEARCH ASSOCIATION.

GRASS EXPERIMENTS.—The fifth annual report of the experiments conducted by this Association has just been issued by Professor Jamieson, which this season deals more particularly with the question, Which of the most approved grasses are most useful in regard to earliness, lateness, quantity and quality of produce?

In the selection of grasses Professor Jamieson says the objects to be kept specially in view are—whether it is desired to produce early pasture, or pasture all over the season, or grass to mow, or the formation of a close sward.

QUALITY.

But how far considerations of the different qualities of grasses would lead to the rejection of some of the grasses, which take a front rank in regard to quantity, and to the acceptance of some of the grasses that yield but little, is a matter that must probably in the meantime be decided by reference merely to

their external character. For although many analyses have been, and are being performed, still they do not as yet point conclusively to the assigning definitely the order of merit in regard to quality.

Looking at the external characters only the following seem the most commendable:—Rye-grass (*Lolium perenne*), Cocksfoot (*Dactylis glomerata*), Sheep's Fescue (*Festuca ovina*), Dogstail (*Cynosurus cristata*).

QUANTITY.

As regards quantity the past three or four years have given very instructive results. Speaking generally the grasses experimented upon may be divided into three groups:—

Those which have produced much—namely, Cocksfoot, Rye-grass, and Timothy.

Those which have produced moderately—namely, Fescue, Foxtail, and Holcus.

Those which have produced little—namely, Dogstail, Poa, and Bromus.

The difference between these grasses have been so marked as to call forth serious attention, for, according to the selection of grasses, the farmer who adopts permanent pasture may have crops varying as 10 is to 6 and to 3.

EARLINESS.

The grasses which deserve favourable mention in this respect are Timothy, Rye, and Cocksfoot. Dogstail, indeed, may occasionally be earlier than any of these, but it is rather by a continuance of its winter growth than by its earlier starting the new year's growth. Timothy is likely first to start out, then Rye, and then Cocksfoot. This is somewhat contrary to what is experienced in the Rothamsted grass experiments, where the earliest grasses are found to be Cocksfoot, Foxtail, False Oat, and Holcus.

Dogstail especially, and Rye, to some extent, are peculiar in assuming, more or less, a fresh growing appearance as winter approaches, and continues more or less green, according to the severity of the weather.

MANURE.

In regard to a manurial dressing for grass-land, the following mixture has been found to answer best in the Sussex agricultural experiments:—¼ cwt. nitrate potash, 1 cwt. nitrate soda, 1½ cwt. superphosphate, and ½ cwt. steamed bone-flour per acre. *John J. Willis.*

CULTURAL MEMORANDA.

TRACHELIUM CÆRULEUM.

THIS greenhouse perennial is a charming subject for the autumn embellishment of either greenhouse or conservatory. It propagates freely from seeds and from cuttings made of the young shoots, and inserted singly in 3-inch pots placed in a gentle bottom-heat, and kept close until rooted, when they should be pinched to cause them to produce side-shoots, which, in their turn, should be stopped until the desired sized plants are obtained, and the flowering period (August) is approached—shifting the plants into larger pots as they require it, potting them in a compost consisting of three parts light sandy loam and one of leaf-mould and horse-droppings, well mixed. The flower-spikes should be supported by sticks. The large trusses of lavender-blue flowers which this plant produces when subjected to pot culture are very telling. Mr. Molyneux, Swanmore Gardens, has frequently shown this plant in fine condition at the Royal Southampton (August) shows. A year or two since he staged a plant having between fifty and sixty trusses of flowers 6 inches in diameter, the plant being 4 feet through.

POTTING LILIES.

Plants of *Lilium auratum*, &c., which have made a few inches of growth should now be turned out of the pots, the old soil shaken off their roots before re-potting in clean well-drained pots in a mixture of

three parts sound fibry loam and one of horse-droppings and leaf-soil, with a sprinkling of coarse sand added, worked well among the roots. Then stand the pots on coal-ashes in a cold pit, water; keep close, and shade the plants from sunshine for a few days until the roots have taken to the soil, when it should be discontinued and abundance of air be given on all favourable occasions. As the plants increase in growth applications of weak liquid manure at the roots two or three times a week, providing they need water that number of times, will be beneficial to them. Should aphids attack the plants, fumigate lightly with tobacco-paper two evenings in succession.

ALOYSIA CTRIODORA.

Cuttings of the young growths of this, the Lemon-scented Verbena, inserted round the sides of 3-inch pots filled with any kind of light soil, having a surfacing of silver-sand, watered, and plunged in a hotbed, will root within a few weeks. They should then be potted off singly into the same size pots, watered, and kept close for a few days until the roots have got hold of the soil, when they should have more air, and be pinched in to insure bushy plants. The Aloysia is a half-bardy shrub. After the plants have got well established they should have plenty of water. *H. W. Ward.*

PLANTS AND THEIR CULTURE.

TORIENTAS.—These pretty annuals, from Cochinchina, are easily managed, and grow rapidly into decorative subjects. A good sowing of seeds should now be made in well-drained pans, using a light sandy soil, and place in a moderately warm moist temperature. In about a fortnight the seedlings will be ready to prick off into pans or boxes or their dowering pots. Keep the plants somewhat close and warm for a short time, shading from the bright sun, and after they are established give more air, syringing frequently. As the plants advance in growth insert a small neat stake to each. The plants will last from six to eight weeks in perfection, but if cut down after flowering they will flower a second time, but fresh batches of plants are preferable. *T. Fournieri* and *T. Bailloni* are the two best species to grow; the former is pale blue and dark purple, with yellow in the throat, and the latter yellow and dark purple.

Closia pyramidalis and its varieties *plumosa*, *coccinea*, and *aurea*, succeed under similar conditions. They may be grown without any fire-heat until the autumn is well advanced, when their scarlet or golden plumes are most admired associated with other late flowers.

Amaranthus.—A few of the more tender sorts may be grown in pots, and treated in the same manner as *Celosias*: *A. salicifolius* and its variety *A. Hendersoni*, together with *A. bicolor* and *A. tricolor*, are the most useful for this purpose. These plants require discrimination to be exercised in giving water, as too much causes damping off at the collar.

Fuchsias.—The grace of these plants, and their handsome flowers, make them general favourites and they are alike useful in large and small gardens. By paying attention to a few simple details, the cultivation of Fuchsias is comparatively easy. Assuming that cuttings were put in some time ago, they will now be established in small pots, and may be potted on as required. The freest branching varieties will not require much pinching of the shoots, but the beauty of the plants being much enhanced by compactness of growth, timely attention should be given to pinching out the points of any shoots which show a tendency to take too much of a lead; moreover, if more plants are coming in at one time than are required, by pinching a portion of the stock rather closely, these will bloom in succession. A small stake inserted in the centre of the plant, with the branches loosely looped up to it, will be all that is necessary in the matter of support. The plants delight in a free, rich soil, using as a fertiliser well-decayed manure. The drainage should be good, and the potting firm, leaving sufficient space for thorough waterings; indeed, it is very important that the plants be well supplied with moisture, both at the roots and in the atmosphere. The temperature may range from 55° to 60°, when it can be main-

tained with little or no fire-heat, and just as much air as will prevent the house from getting close and steamy should be afforded. These are conditions under which Fuchsias will grow rapidly, and a good criterion of the proper atmospheric conditions is when drops of exuded water are observed in the early morning hanging dew-like from the edges of the leaves. Avoid much fire-heat, and shut up early in the afternoon, well syringing the plants at the same time and removing the shading, which should be light. Fuchsias should be well syringed at all times, even when in flower, as it does not materially affect the flowers, and it keeps the plants free from insects.

Although some florists have succeeded in raising many fine varieties, there are a few of the older species and varieties which merit a place in large collections; these are—*fulgens*, with long scarlet flowers (a plant very handsome in a small state); *corymbiflora*, somewhat similar to *fulgens*, but succeeding best when planted out and treated as an evergreen; *arborescens*, which forms quite a tree, and which at this time of the year produces immense panicles of lilac or rose-coloured flowers; it is also an excellent subject to plant out in a conservatory. It flowers on the wood of the previous season. *Gracilis* and its variegated variety make good pillar plants; *microphylla* and its near ally, *thymifolia*, are both distinct looking-species, which may be made to form nice pyramidal plants; *cordifolia* and *splendens*, whose scarlet and green flowers and large heart-shaped leaves render them ornamental plants; *tryphylla*, is very distinct, both in flower and foliage, the latter being very ornamental; the beautiful many-coloured leaves of *F. Sunray* should not be forgotten. *F. Ross, Pendell Court.*

THE FLOWER GARDEN.

SUBTROPICAL BEDDING PLANTS.—The majority of these should be potted on, the strongest and best plants being shifted into 4 to 6-inch pots, the remainder into smaller ones. Use ample drainage for these subjects, and a good rich compost made previously warm, so that strong healthy growth may be quickly made. Keep them well syringed overhead daily, and when they have taken hold of the new soil, move them to a house with a lower temperature than that in which they have hitherto been. At no time should they be allowed to suffer from want of water at the roots. Fumigate with tobacco-paper to keep down aphids. In addition to the usual plants grown is a host of other plants of a different character used for subtropical work, such as the hardier species of Palms, Dracenas, *Phorranium*, *Grevillea robusta*, *Ficus*, *Aralia*, *Musa Ensete*, and *Agaves*, and numerous succulents. All these should be receiving greenhouse treatment and free ventilation, heat being dispensed with when the weather is such that it is safe to do so.

Dahlias.—Stake and tie the forwardest plants, and place them in cold frames without further delay. Shift into larger pots rooted cuttings before they become pot-bound, hardening off in due course. The frames should be protected at night with mats, and be well ventilated during the day, removing the lights entirely when it is considered safe to do so, thereby gradually preparing them for planting out. *J. Horsfield, Heytesbury.*

FRUITS UNDER GLASS.

PINES.—The early-started Queens will now be swelling rapidly, and every attention must be paid to their requirements, keeping them steadily moist at the root, but not wet, and when watering is required, just colour the water with guano each time. Do not syringe the plants heavily overhead, else undue development of the crowns will result; merely dew the plants over with a very fine spray at shutting-up time, but the plunging material, walls and paths, should be liberally damped with tepid water, and a temperature of 95° attained after the ventilators are closed. Guard against very hot pipes and bright sunshine, and when the fruits are half-coloured, the atmosphere should be kept rather drier, and a good circulation of warm air maintained.

Give no more water at the roots when the fruits have reached this stage, and should there be only a few near the ripening stage these may be lifted out of the bed, and placed in a vinery where the Grapes

are colouring. If more fruit turns in than are wanted at the time, suckers may be detached from the plants, and potted, and the pots with the fruit placed in an airy fruit-room, where they will keep in good condition for a fortnight. Plants which are at the blooming stage must be kept in a drier atmosphere until the flowers are fertilised, afterwards giving the same kind of treatment afforded to plants swelling their fruit. Other plants which have been pushed forward, with the view to resting them during this month, to get them to start for early winter fruiting, may have the bottom-heat gradually lowered to 75° to 80°, and the atmosphere from 60° to 65°, with less water given at the root, but it will not be safe to allow them to become so dry as during the earlier part of the year. Light shading may be placed over the glass during the brightest part of the day, and air may now be more freely admitted.

Successions which were potted in February and March should now be encouraged to make free growth, to this end keeping the bottom-heat at 85° to 90°, and when opportunity offers shutting up with a solar heat of 90°, not syringing the plants heavily overhead, but damping the surface of the beds, paths, &c. Let the night temperature for those be 70° at 10 p.m. The object in view should be stocky growth, broad leaves of good texture and dark green hue. Occasional waterings with soot-water will much improve the colour of the foliage. Some varieties are more susceptible of injury to the leaf from the sun's rays than others; the Cayenne being, perhaps, one of the most tender, and browning is more likely to ensue just now after long absence of sunshine; some thin material should therefore be in readiness to run over the glass from 10 a.m. to 2.30 p.m., merely to break the force of the sun's rays. Recently potted suckers and other plants must be shaded during bright weather, and over-watering of those which have not well filled their pots with roots must be avoided. Put in fresh suckers as they become large enough, and pot on any which are sufficiently rooted. Keep the bottom-heat from 85° to 90° and the atmosphere 65° to 70°. *W. M. Baillie, Luton Ho.*

THE KITCHEN GARDEN.

LETTUCE.—Where a constant supply of Lettices must be kept up through the summer, and to be in a measure prepared for hot, dry weather, preparations should now be made on the land where the crops will be grown. For the July and August supply the cool, shady northern borders are best. The soil should be heavily manured and deeply dug, that all may be ready for the plants, the seeds of which were sown a fortnight since. To keep up a constant supply, a little seed should be sown once a fortnight up to the end of June, and the plants put out as soon as it is possible to handle them, planting a sufficient number each time. In a dry time a plentiful supply of water must be afforded the plants, and some liquid manure occasionally. To render the waterings effectual, plant them in shallow drills. Beyond hoeing to keep down weeds, this is the only attention they will require.

General Work.—Brussels Sprouts, &c., sown early on hotbeds will now require transplanting at 4 inches apart in a sheltered position, and a plot of ground should be got ready for planting them out when large enough. The main crop of Celery will now require pricking-out 4 inches apart in cold frames in dung 3 inches deep laid on a hard cinder bottom, and the soil that is put over this to the depth of an inch should be light and rich. Capsicums should be potted into 32's and grown in a warm house, if the garden be in the midland and northern parts of the country, but to the south of London they do well enough planted out at the foot of a south or south-west wall. Early crops of Carrots, Spinach, &c., now coming up should have the Dutch hoe run between the rows as soon as they are well through the ground, to prevent the growth of weeds and keep the soil in good condition. Peas sown in February will now require staking. Any varieties of Peas sown at this date will begin to bear in about ten weeks in most instances, although some varieties are longer in coming into pod than others. Early Potatoes in warm positions will now require daily attention to keep them covered with soil as long as that is possible. A few branches of Yew or Spruce may also be placed around them. Seeds of Marrowfat Peas, Globe Artichokes, Broad Beans, White Cos Lettuce, Spinach, and Radishes may be sown. *W. H. Divers, Kilton Hall, Stamford.*

Knairs and Burrs.

SOME few years ago Sir JAMES PAGET, in a lecture on "Elemental Pathology," drew attention to the

study of vegetable pathology as introductory to that of animals, and showed that the processes which take place in animals, though eventually more complex, are fundamentally the same as those which occur in plants. The famous German pathologist, VIRCHOW, expresses himself in like manner:—

"A pathological tumour in man (he says) forms in exactly the same way that a swelling on a tree does, whether on the bark or on the surface of the trunk or a leaf, where any pathological irritation has occurred. The gall-nut which arises in consequence of the puncture of an insect, the tuberos swellings which mark the spots on a tree where a bough has been cut off, and the wall-like elevation which forms round the border of the wounded surface produced by cutting down a tree, and which ultimately covers in the surface—all of these depend upon a proliferation of cells just as abundant, and often just as rapid, as that which we perceive in a tumour of a proliferating part of the human body. The pathological irritation acts in both cases precisely in the same manner; the processes in plants conform entirely to the same type."

Stimulated by the example of these masters, medical men have of late years directed more attention than formerly to the knairs and other outgrowths from plants, in the hope that the study of their mode of formation would throw light on the morbid growths of animals and of human beings. The parasitism of Mistletoe some years since—anterior, indeed, to the period to

which we have just referred—was investigated by Dr. JOHN HARLEY, avowedly with a view to the explanation, if possible, of the mode of growth of cancer. In dealing with this subject we must not be led away by fanciful analogies, however seductive these may be. We must be sure we are comparing things that are fairly comparable, and not those which present merely superficial resemblances.

In an essay before us, Mr. W. R. WILLIAMS * traces the progressive stages of development in plants from the lower to the higher, alludes to the formation of buds, normal and adventitious, and to the appearance of "sports." From these bases he passes on to the tumours found in the human subject, and which he traces to undue or perverted cell-growth, owing to some cause or other, which causes alterations in the nutritive processes. Changes in nutrition by excess, defect, or perversion are indeed the acting causes in these cases, but what we specially want to arrive at is the cause which brings about these changes. Until we know this we cannot hope to cure the evil tendency, even if we are able by surgical means to remove it temporarily. Mr. WILLIAMS classifies tumours in trees under three heads. First, knairs, which include the nodules so often met with in the bark of the Beech and other trees, and which are sometimes provided with a pedicle or stalk, and sometimes are not. Structurally they consist of very hard dense wood, either regularly or confusedly arranged. These knairs are usually abortive branches; that is to say, they are made up of a number of buds which do not develop properly, but are crowded together into one irregular mass instead of elongating into a shoot with buds at more or less regular intervals. They thus illustrate that combination of, to a certain extent, opposite tendencies to which we have often referred, viz., an excess of growth, coupled with arrested development. The use of the term "neoplasm," or new growth, is, to our thinking, a misnomer in such cases. These are cases, not of new growths, but of alterations of old ones.

The second class of knairs is like unto the first, but the "tumour" is always continuous with the branch from which it springs, and is never narrowed at the base into a pedicle. These tumours may also be considered as abnormally developed branches. Mr. WILLIAMS compares them to the "exostoses," or bony protuberances which occur on the skull of human beings.

The third group alluded to by Mr. WILLIAMS is that in which the tumour is densely covered with small twigs, the outcome of the development of numberless buds. Such growths are common in old Lime trees and Birch trees. All these three cases, then, owe their origin to excessive or modified cell-growth associated with either a restricted or an excessive development of buds, and this modified cell-growth constitutes, in the words of Mr. WILLIAMS, "the nearest approach in vegetable pathology to the sarcomas and carcinomas (cancerous tumours) of animal pathology." Mr. WILLIAMS points out that the absence of infectiveness or malignancy may be urged as an objection to this comparison. But there are some vegetable tumors which there is good reason to suppose are infective; and what we have to do is, to endeavour to ascertain which are infective, and which are not, and in the case of the "malignant" ones to endeavour to ascertain to what their infectiveness is due. Thus certain forms of canker in Apple trees, certain instances of hypertrophy or over-

growth of the tissues and of the change of their cells into gummy substances, are now stated, on good authority, to be due to presence of bacteria; and if a portion of the infected tissue be inoculated into a previously healthy tree disease results. In other cases we know that the presence of a parasitic fungus causes great swelling of the tissues, sometimes without other appreciable change, while in the curious cases of companionship included under the term "symbiosis" fungus and plant live together in amity, the fungus positively contributing to the well-being of the plant, stimulating cell-growth and causing the storage in the constituent cells of nutritive matter in sufficient abundance to satisfy the requirements of the confederate plants. Professor MARSHALL WARD's recent researches into the nature of the tubercles almost universal on the roots of Leguminous plants furnish a very striking instance of this. In these cases the infective agent is a germ or fungus-spore. But there are other cases in which no such infective process is observable, such as the knairs already alluded to.

Again, there is the large class of galls where the most extraordinary deformities are produced as the consequence of the puncture of an insect. Some of the tumors which Mr. WILLIAMS would class under "burrs" are the result of insect agency (Phytoptus). Transfer the insect, and infection would result.

Mr. WILLIAMS had not to deal with plants except by way of illustration, or he might have added that increased cell-growth arising from injury or other cause does not give rise exclusively to buds, but very frequently to roots, as every gardener who strikes a cutting knows. A cutting is made; the wound becomes covered over with a thin layer of cork-cells, then an increased growth of cellular tissue, or "callus" in garden phraseology, occurs, much starch and other nutriment collects in the new cells, and by-and-by, not buds, but roots are produced. We do not yet know why in particular cases tubers, such as those of the Potato, or adventitious buds or roots, as just described, are developed. The origin is the same—an overgrowth of cells, followed by an accumulation of food; but then comes the divergence, as difficult to be accounted for as the different varieties under which cancer may present itself.

One other point we may mention which has bearing on the subject before us, and that is the shape of the constituent cells of these outgrowths. In plants, of which alone we are now speaking, when the cells are confined within a firm and relatively unyielding epiderm or cortex, they remain relatively small and spheroid, but become, as the pressure increases, flattened and compressed. But if the epidermal layer be injured or removed, so that the pressure is taken off, then the cells do one of two things—they either enlarge greatly, the cohesion between cell and cell becoming weakened, so that they often become entirely isolated, or, instead of retaining a spheroidal shape, they economise material by assuming a star-like arrangement with a central body and radiating arms, by means of which latter they retain communication with their neighbours.

On other pages we give illustrations of various forms of Knair, and which we could multiply, did space permit.

CYPRIPEDIUM INSIGNE (SEE SUPPLEMENTARY SHEET).—The view presented in our supplementary sheet is that of a houseful of *Cypridium insigne* and its varieties in Mr. W. S. KIMBALL's garden, Rochester, United States of America. Mr. KIMBALL is one of several enthusiastic cultivators of Orchids

* "Vegetable Tumours in Relation to Bud Formation," *Trans. Patholog. Soc. Lond.*, 1887.

CYPRIPEDIUM INSIGNE AT MR W.S. KIMBALL'S ROCHESTER U.S.A.

THE PHOTOGRAPHED BY A. G. B. BOSTON AND A. G. B. BOSTON, U.S.A.

in the Eastern States, who in pursuit of his hobby has acquired a valuable collection of the plants, and especially of Cyripediums. A short account of his collection will be found in our issue for January 28 last, p. 117. In reference to the Cyripedium-house depicted Mr. KIMBALL's gardener (Mr. G. SAVAGE) writes:—"This group shows a batch of plants of *C. insigne* with about 2000 flowers on them. They have been grown in an intermediate-house with the ventilators open night and day all through the summer and autumn months. We give them all the light possible, except in midsummer, which perhaps is rather detrimental to the foliage, it being rather light in colour. The great amount of light afforded induces them to grow with more robustness and flower more profusely than if they were grown in a warm, moist, shady stove." In a subsequent issue we propose to give a view of the Water-Lily house in the same garden.

THE ROYAL HORTICULTURAL SOCIETY.—In compliance with a very generally expressed feeling that the Society would do well to avail itself, if possible, of the known horticultural tendencies of many "City" men, the Royal Horticultural Society is about to make an experiment to which we cannot but wish all success. It is intended to hold a two days' show in the Temple Gardens on May 17 and 18. We understand that there will be no difficulty as to exhibits; but to make such a show a financial success the weather must be good enough to be fine, and the intentions of the Society must be made widely known some time beforehand; and, moreover, provision must be made for the admission of the populace at the cheapest possible rate after the Fellows and privileged guests have been afforded an opportunity of seeing the show. An outside committee is working with the Council in the matter, and we trust the Society will receive every encouragement and support. The Council is working with a diligence and assiduity that should be crowned with success, and which, at any rate, command the gratitude of horticulturists. The financial difficulty still remains the most perilous one to be encountered, but it is very far from being insuperable if horticulturists of all grades will do their duty. We learn that Messrs. SHIRLEY HENDER and H. HERRST, as members of the Fellows' Committee, have been added to the Chiswick Gardens Committee of Management.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are informed that the eighth annual card collection in aid of the Gardeners' Royal Benevolent Institution is now being made; the cards are returnable to the Secretary on or before Wednesday, July 4. The amounts collected will be added to Mr. CHAMBERLAIN'S subscription list, and will be duly announced in these columns.

THE GARDENERS' ORPHAN FUND.—A meeting of the committee of the above took place at the Caledonian Hotel, Adelphi, W.C., on the 27th ult., Mr. GEORGE DEAL in the chair. Mr. A. J. BROWN, local secretary for Lindfield, Sussex; and Mr. G. W. CUMMINS, local secretary for Carshalton, were also present. The minutes of the last meeting having been read, the Chairman proposed a vote of condolence with the family of the late Mr. JOHN WOODMANNE, bearing testimony to the valuable services he had rendered in the formation of the Fund, and also to his excellent qualities as a gardener and a man. This was seconded by Mr. H. HERRST, supported by Mr. A. F. BARRON, and carried by acclamation. The banker's book was produced, and showed that the sum of £735 3s. 7d. was standing to the credit of the Fund. The Hon. Sec. reported that the total amount of donations to date was £1174 0s. 6d., of which sum £1063 3s. had been paid; and subscriptions £386 11s. 6d., of which £224 0s. 6d. had been paid. The names of 136 donors and subscribers were received as sent in since the last meeting of the committee, and the amounts being—donations, £32 18s. 6d., and subscriptions, £36 8s. Mr. BROWN handed in the sum of £7, the proceeds of a concert recently held at Lindfield,

and he stated he hoped the concert for this purpose would become an annual affair. Mr. WILDSMITH also sent the sum of £2 2s. 8d., the proceeds of a lecture recently delivered. A special vote of thanks was passed to Messrs. BROWN and WILDSMITH for their aid. It was stated that one local secretary had forwarded the names of sixty five-shilling subscribers. Ten nomination papers sent in on behalf of candidates for election on the Fund were examined and approved, the time for sending in the same having closed on the 23rd ult. A sub-committee, consisting of Messrs. DEAL, ROUPELL, WYNNE, and A. F. BARRON, was appointed to prepare the voting papers for issuing to subscribers. The arrangements for the dinner on July 13 were also considered and the preparation of a circular and other matters referred to the sub-committee. Various accounts were ordered to be paid, and it may be stated that no cheque can be drawn without an order upon the Treasurer signed by three members of the committee. The proceedings closed with the usual vote of thanks to the Chairman.

HORTICULTURAL CLUB.—The usual monthly dinner and *conversazione* of the Horticultural Club will take place at the Hotel Windsor, Victoria Street, Westminster, on Tuesday, May 8, at 6 p.m. Subject of discussion, "Peaches," to be opened by Mr. T. FRANCIS RIVERS.

A NEW BOILER FOR HEATING PURPOSES.—The great Horticultural Exhibition which has lately been held at Ghent afforded an opportunity of noticing a new warming apparatus, to which a Gold Medal has been awarded, and to which we wish to call the attention of horticulturists and amateurs. This boiler is tubular and vertical. It is quite simple, and possesses such advantages, that it seems desirable to give a few details concerning it. Some interesting experiments, a record of which is before us, have been made from November 15, 1887, to March 31, 1888, by M. D. MASSANGE DE LOUVREX, at the Château de Bailionville, and also by our compatriot, M. JAMES BRAY, of Ghent. In M. MASSANGE'S establishment this heating apparatus served to heat about 500 metres of pipes in two Cattleya-houses, and in one Cyripedium-house; the fuel employed was non-bituminous (*houille maigre*). The apparatus worked with great regularity, it required no attention during the night, and consumed scarcely 108 kilos of fuel in twenty-four hours. In M. JAMES BRAY'S establishment this boiler heated 600 metres of pipes, warming four Orchid-houses. The fuel employed was gas-coke; similarly favourable results were obtained, and the consumption was only estimated at 2 francs for twenty-four hours. If the severity of the winter 1887—1888, the sudden changes and the low temperature (which fell at Bailionville to 25° C. below freezing point) be considered, these results are most gratifying. Among the advantages claimed for this warming apparatus are these:—It is very powerful; it occupies but little space, and requires no setting. When burning, all the parts in contact with the water remain cool; there is no waste heat. It is easily cleaned. By means of a valve or slide the heat may be increased or diminished at pleasure. This boiler is patented in England by the inventor, M. BRASSEUR, of Marche, Luxembourg, Belgium.

"LINDENIA."—The following Orchids are illustrated in recent numbers:—

Cypripedium leeanum ×, Rehb. f., t. 125.—Dorsal sepal large, white, with rows of carmine dots; lateral petals olive-coloured, with carmine streaks; lip olive, flushed with reddish-brown. It is a cross between *C. Spicerianum* and *C. insigne*.

Oncidium cheiroporum, t. 126.—A species with small shining green pseudobulbs, lanceolate leaves, and erect, many-flowered panicles, bearing numerous small yellow flowers. It was discovered on the volcano of Chiriqui by VON WARSCEWICZ.

Rodriguezia Bungeorothi, t. 127.—A species with oblong pseudobulbs, lanceolate leaves, and dense cylindrical spikes of small rose-coloured flowers. A native of Venezuela.

Odontoglossum odoratum var. *baphicanthum*, Rehb. f., t. 128.—Pseudobulbs ovoid, leaves oblong acute. Flowers in elongated racemes, each nearly 3 inches across, stellate segments, lanceolate, yellow with red spots; lip hastate, lanceolate, of the same colour as the segments, but rather smaller. New Grenada.

Cypripedium Moensianum, hort., t. 129.—Leaves mottled, flower-stalk covered with shaggy red pubescence; flowers 5 inches across; upper sepal suborbicular acute, white, with about eighteen convergent green nerves marked with reddish-brown spots; petals spreading, oblong-obtuse, whitish, green at the base, reddish at the tip, with numerous purplish-brown spots in the centre; lip bag-shaped, greenish flushed with red. Introduced from the Philippines with *C. Argus*, and requiring a stove temperature.

C. Houatcanum, hort., t. 130.—Leaves tessellated, flower-stalk with reddish shaggy pubescence, flower 4 inches across; upper sepal roundish-acute, white flushed with rose; lateral petals oblong-ciliolate, at the margins deep rose coloured; lip reddish.

C. (Selenipedium) Wallisii, t. 131.—Upper and lower sepals oblong-lanceolate acuminate, greenish-yellow, with green stripes; petals linear, strap-shaped, prolonged into very long tendrils, reddish, lip cream-coloured, with pale purplish spots.

C. villosum, Lindl., t. 132.—Leaves oblong emarginate, flower-stalk covered with reddish shaggy pubescences, upper sepal roundish acute, whitish, disc green, with red nerves; petals oblong, from a narrow base, brownish-yellow; lip yellowish.

OPENING OF THE TOWER GARDENS.—These gardens, which have been for some months in process of remodelling, were opened on Monday, April 30, in the absence of the Earl of MEATH, by Mrs. MONTAGUE, the wife of Mr. SAMUEL MONTAGUE, M.P. Lieutenant-General Lord CHELMSFORD, G.C.B., Lieutenant of the Tower, in the enforced absence of the Constable of the Tower, Lord NAPIER of Magdala, addressing Sir WILLIAM VINCENT, said, "The duty devolved on him of handing over to the Boulevard Association the key of the grounds," and a copy of the officially approved regulations. The regulations were then read as settled by the Tower authorities and approved of under the sign-manual of HER MAJESTY. They were short, and to the effect that in cases of fire, riot, fog, or any other similar necessity, the Constable of the Tower should have complete control over the gardens; that they should be open from the hour of 10 a.m. up to half an hour before sunset, and should so remain open from April to September; that the gardeners and caretaker should be provided by the Association, and a box should be built for their use, but no permanent edifice erected, and that the gate should be locked each evening by a warder of the Tower, who would hand over the keys to the yeoman of the Guard. Lord CHELMSFORD concluded by expressing his own personal sympathy with the movement. After some few remarks by Mrs. S. MONTAGUE, Sir W. VINCENT, Mr. S. MONTAGUE, the Hon. CHARLES FREEMANTLE, the gardens were declared opened and the public were directly afterwards admitted. The gardens form a narrow strip around the moat, and have a main walk of about a quarter of a mile in length. The banks and slopes are turfed or covered with Ivy on the lower, and planted with shrubs on the upper portions. When the turf and grass seeds have grown, and the bushes and trees become established, the garden will form a pleasant adjunct to that part of the metropolis adjacent to the Tower.

NEW HOLLY.—At the sale of the Lawson Nursery stock at Bangholm Nurseries, Edinburgh, the entire stock of the splendid new Golden Variegated Hodgson's Holly (twenty-four plants) which originated in the Bangholm Nursery, Edinburgh, and including the original plant of *Ilex Hodgsoni* from which the first grafts were taken, was sold to Messrs. LITTLE & BALLANTYNE, nurserymen, Carlisle.

ROSE SHOWS IN 1888.—The following shows were not announced in previous notices on pp. 506 and 539:—Tuesday, June 26, Boston; Thursday, June 28, Brockham and Ryde; Wednesday, July 4,

Farnham, Hitchin, and Richmond; Tuesday, July 10, Gloucester and Oxford; Wednesday, July 11, Ealing; Thursday, July 12, Birmingham, and Carlton-in-Workshop; Saturday, July 14, New Brighton; Monday, July 16, Newcastle-under-Lyne; Wednesday, July 18, Birkenhead; Saturday, July 21, Manchester; Tuesday, July 24, Tisbury. In sending the above list, Mr. E. MAWLEY, Rose Bank, Great Berkhamstead, states that the only exhibitions not held by the National Rose Society, or by societies in affiliation with it, are those at Birmingham, Boston, Carlton-in-Workshop, Manchester, Newcastle-under-Lyne, and Richmond. In the case of Birmingham and Boston, where the shows extend over two days, the date of the first day's exhibition only is given.

DEUTZIA CRENATA, WELLSII.—Messrs. HANS NIEMAND & Co., Birmingham, send us, under this name, a branch of this beautiful shrub, each shoot of which ends in a raceme of bell-shaped pendulous flowers, snow-white and very double, hence it is very valuable where white flowers are required. The plant is a free grower and flowers well in 5 or 6-inch pots, and submits readily to forcing. Though called by a specific name it is evidently nothing but a form of *Deutzia crenata*, a synonym of which is *D. scabra*.

AUSTRALIAN IRRIGATION COLONIES.—We are requested to state that offices have been opened in London, at Cornwall Buildings, 35, Queen Victoria Street, E.C., by Messrs. CHAFFEY BROTHERS, Limited (late of Ontario, Southern California), for the Australian Irrigation Colonies, which are now being carried out on the River Murray under special Acts of the Parliaments and regulations by the Governments of Victoria and South Australia.

PITCH PINE.—Notwithstanding the enormous quantities of Pitch Pine (*Pinus australis*) regularly sent from America to the English and other European markets, it is satisfactory to know, from a recent official report, that the supplies are still very extensive. It is said that the supply of this valuable timber at the present rate of consumption from Pensacola may be relied upon at least for the next fifty years. The Pitch Pine forests are of spontaneous growth, indigenous to the sandy soil of portions of the Southern States where the timber most abounds, and it is estimated "that the timber supply of the Pine regions increases at the rate of about 5 per cent. per annum; but in Florida, with its loose methods of felling the woods and cutting down timber which is never used for commercial purposes, this annual increase is more than offset by the annual waste."

VANILLA CULTURE IN MEXICO.—Our contemporary, the *Chromist and Druggist*, quoting from a St. Louis paper, gives some details on the cultivation of Vanilla in Mexico, from which it seems that the plant flourishes in two places, namely, Papantea, in the State of Vera Cruz, and Misantia; the first place, however, is the most important. It is a town of about 10,000 inhabitants, and is in the land of the Toccanac Indians, an extremely indolent and improvident race. The Vanilla plant is found wild in the forests. The fruits ripen in November or December, when they are gathered and put into sacks and brought into Papantea to market. The buyers are Spaniards or Americans, and the competition is described as similar to what "is to be seen in a street where second-hand stores prevail. The old women are generally in the lead, half naked, and with haggard faces begrimed with dirt. Then come the children, equally pitiable in appearance; and finally the old men bring up the rear, with long stiff hair, matted and dirty, sometimes standing out 12 inches, while their beards, filthy and long, lend a finish to a picture that is most revolting." The Vanilla pods are purchased by middlemen at the rate of 42s. to 50s. per 1000, taken as they are put up by the natives. The average weight of 1000 good sized green Vanilla pods is about 60 lb., which, when dried do not exceed 10 lb. The first fine morning after the pods are gathered they are arranged on planks, covered with quilts and exposed partially to the

air, this being repeated seven times before the water has all evaporated, and they have become sufficiently dry. This is known as the sweating process, after which the pods are slightly heated and placed on shelves to dry, when they are assorted into lots, each containing fifty beans, and graded according to length. In fine weather the curing process takes three weeks, but such weather rarely prevails, and the curing sometimes takes from four to five months. Last year the beans sold for 58s. per 100, which was about a pound; but owing to a heavy crop this year, and the growing competition in the business, the best beans only bring 50s. a pound or 100, and the inferior from 30s. to 42s. The principal markets for Vanilla beans are New York, St. Louis, and Chicago. They are bought chiefly by wholesale druggists and fine confectioners, and are becoming an important article of Mexican commerce. Last year, from the vicinity of Papantea alone, 60,000,000 beans were exported.

THE UTILISATION OF MOORS.—In some of the provinces in Holland exist large tracts of heath and moorland which at present are of little value, although once covered with dense forests. An effort is now being made to form a company, whose object it will be to attempt a gradual utilisation of the soil by replanting trees. How much good may result from such an enterprise under careful management is shown by a similar undertaking in Denmark, which has started some 400 plantations in different parts of that country.

FARMING IN MASSACHUSETTS.—Professor JOHN ROBINSON, addressing the Massachusetts Board of Agriculture, remarks upon the "abandoned farms, the deserted fields, and rapidly decaying houses of the once well kept and profitable farms." The reasons cited for this state of things are the cost of manuring, the fact that less labour in other directions is more profitable, and "man's instinctive dislike to isolation." The competition with California, Florida, and the West Indies, which supply the New England markets earlier and cheaper than can be done in the Eastern States, has also much to do with this state of things. It is worth noting that in the United States, or some portion of them, agriculture is in as depressed a condition as it is here, in spite of Protection. The remedies suggested are small farms which can be cultivated by the farmer himself, and the planting of waste or exhausted lands with timber. Professor ROBINSON adds some useful remarks as to the way in which planting should be done. He gives one illustration showing "how not to do it." In order to celebrate the Centennial of American independence it was resolved to plant a tree in a particular school-yard. The tree was purchased, and turned out to be an English Oak, "an emblem of royalty, and naturally a poor tree in this country, which may now be seen starved and puny, and looking as if it fully appreciated the inappropriateness of the selection!"

PLANTING AT KYLEMORE.—A correspondent of the *Galway Express*, who has been making a tour in Connemara, mentions the enormous extent of planting on Mr. MITCHELL HENNY's mountain property. "Long before you reach the house," he writes, "you drive through acres of evergreens, and on the mountain slopes are planted Firs and other trees. Years hence, when all this planting shall have reached its fulness of growth, Kylemore will be as an emerald, making glad the mountain wastes, clothing them—some of them, at least—with arboreal verdure."

THE CULTURE OF COLZA IN NORMANDY.—The following note from a report on the trade of Caen, Normandy, will show how greatly affected the vegetable oils used for illuminating purposes have been since the more general utilisation of the mineral oils from America. The report in question says:—"The cultivation of Colza, which a few years ago was very extensive in this Department, appears to be gradually dying out altogether, and

from being, as formerly, the mainstay of the farmer, to which he looked forward to paying his rent, is now meeting with very little demand through the introduction of mineral oils, which are cheaper for household and other lighting purposes. Further, the Colza oil was extensively used for lubricating purposes for machinery, but it is now superseded by the introduction of the heavier and cheaper oils. It is consequently very little sought after. As an instance also of the depreciation of this article of agricultural industry amongst others, through foreign competition, the Colza grain is exported in large quantities from Kurrachee, via the Suez Canal, to some of the French ports, whence it is disposed of at a lower price than the native oil commands in the French market."

CAMELLIAS AT WALTON LEA, WARRINGTON.

It is now rather late in the season to speak of these beautiful flowers, and yet it is at this present time that a fine display of Camellias is to be seen in these gardens. Having remarked these plants on several occasions, the mode of growing them here may be of interest to your readers. For some twelve years the majority of the specimens were grown in a house some 50 feet in length; here they were planted out, and had developed into splendid pyramids, which every year flowered beautifully. About a twelve-month ago it was found necessary to give the plants increased space; accordingly, the house was enlarged to 100 feet in length, 15 feet 6 inches in width, and 14 feet in height, the back wall being 10 feet high. The house being a half-span, with an east aspect, will in a measure account for the lateness of the flowering period, since but little direct sunlight falls on the house in winter and early spring. There is a path in the centre, and looking from the ends where the plants are gay with blooms, a gorgeous sight is presented to view. The plants were removed in the month of May last year, and so successfully was the operation performed, that at the present time some of them carry from 300 to 400 perfect blooms. Choice varieties of Clematis are planted in the bed at the back of the house, to afford covering for the wall, and to creep over the roof, these being kept within bounds so as not to unduly shade the Camellias. On the front a number of *Lapageria rosea* and alba are also planted, which will run up straight rods. It is hoped that with these climbers and the Camellias there will not be any lengthy period of the year when a good show of blossom will not be afforded. Taking the plants in the bed at the back of the house, there are three specimens of the old double white, one of imbricata, also one each of the following kinds:—*Elegans*, *ochroleuca*, *Lavinia Maggi*, *De la Reine*, *Hendersoni*, *Commandatore Batti*, and *Napoleon III*. These are pyramidal in form, with leaves to the ground, 10 to 12 feet high, and 6 to 7 feet in diameter. The vigour of these plants is really remarkable. On the front bed are the following:—*Two of Lady Hume's Blush*, one each of *Jenny Lind*, *Jubilee*, *candidissima*, *Duc de Bretagne*, *fimbriata*. These are also perfect in form, 8 feet high, and 5 feet in diameter. Also *tricolor*, *imbricata*, *Auguste Delfosse*, *Carolina*, *Mathotiana*, and one other, having pink flowers, unnamed; these are 5 to 7 feet high, and 3 to 5 feet in diameter. On the back wall, covering a large portion of the space, are the follow-

ing:—reticulata, with 150 perfect flowers open; alba plena, eximia, Madonna, Saccoi-nova, Pelaskia, and a very beautiful white variety, the flowers being marbled with bright rose.

[To Mr. Kipps, who forwarded a boxful of many of the beautiful varieties mentioned by our correspondent, great credit is due for his successful management of the Camellias under his charge. Some of the flowers were of great size, those of *C. reticulata* measuring nearly 7 inches in diameter. The contrast of the golden anthers with the colour of the petals in the semi-double and single flowered varieties, as in the last-named, makes them more gorgeous than the most perfect doubles, at least when observed on the plants. Ed.]

Besides the Camellias there are many other things of interest in the gardens. The vineries give promise of plentiful crops of fruit. The Pine-apple is also well done. Stove and greenhouse plants are well represented, while some select specimens of Orchids are in good health, and several freely blooming.

Chrysanthemums are always to be seen here in fine form. Mr. Kipps is well known as an enthusiastic grower of these plants, and as a consequence his services are often called into requisition at Chrysanthemum shows. The pleasure grounds are in keeping with the occupants of the houses—neatness, order, and management being observable everywhere. *W. S., Preston.*

TREES AND SHRUBS.

KALMIAS.

KALMIA LATIFOLIA.—In many gardens this pretty shrub is seen in anything but a satisfactory state, and this is due solely to planting it in unsuitable and too dry soils, for the *Kalmia* likes peat and to be well supplied with moisture during its season of growth. Some of the largest and healthiest plants we have seen were growing in peat bog that had simply been relieved of too abundant moisture, and treached over previous to planting. These fine plants, 6 feet in height, were, in the month of June, thickly studded with flowers, which rendered the bushes visible a long way off.

There is a very distinct and pretty form of the broad-leaved *Kalmia* named *myrtifolia*, which is of dwarfer growth than the parent, and has smaller leaves and flowers. It is of value for planting where the *latifolia* would prove too large, and being ornamental and distinct, it is much sought after by planters.

An early flowering species will be found in *K. glauca*, the blooms of which are usually in perfection in March and April. They are produced in great abundance by healthy plants, in terminal corymbs, and are of a pleasing shade of pink.

The narrow-leaved *Kalmia* (*K. angustifolia*) is another distinct plant, whose merits are such as to render it well worthy the attention of planters. *A. D. Webster.*

HEADING BACK DECIDUOUS TREES WHEN PLANTED.

This practice is generally condemned in this country, but it often carried out in France and other countries abroad when the trees have not been prepared at the root by transplanting, and it perhaps is the best thing to do under the circumstances. The trees are cut off at about 10 or 12 feet from the ground, and the usually much mutilated straggling roots are cut back so as to be conveniently inserted in small pits, and care is always taken to cut off any injured roots and rootlets. Trees without heads need no stake the first year, as wind-waving is not to be feared, and by the time the tree acquires a head its roots are sufficient support to it. Certainly planting with a head of branches and a due amount of roots is the best, the branches being somewhat pruned back in the early spring of the second year after planting. The method first alluded to may with advantage be followed if it be required to remove otherwise suitable trees from out of an ordinary plantation to be planted elsewhere. *M. W.*

SCOTLAND.

SCOTTISH HORTICULTURAL ASSOCIATION.

THE monthly meeting of this Association was held in 5, St. Andrew Square, Edinburgh, on the 1st inst., the President, Mr. McKinnon, The Gardens, Scoon Palace, in the chair.

A lecture was given by Mr. W. Ivison Macadam on "The Elements Present in Plants."

Exhibits were unusually interesting and numerous. A magnificent specimen of *Dendrobium Devonianum* with 980 blooms, open and fresh; and a no less remarkable specimen of *D. Wardianum*, with

FIG. 76.—BURN ON OAK: TO ILLUSTRATE ARTICLE ON P. 560.

189 blooms of great size, were exhibited by Mr. Wm. Kidd, Ardarrook Gardens, Garelochhead, and were awarded a First-class Certificate.

Mr. Grossart, Oswald House, Oswald Road, Edinburgh, exhibited a very fine plant of *Cattleya Lawrenceana*, with four trusses, bearing in all eighteen grand blooms, for which he was awarded a First-class Certificate. From the same source came also well bloomed samples of *C. citrina*, *Lælia elegans* and *L. purpurata*, *Odontoglossum sceptrum* and *O. luteo-purpureum magnificum*. A most attractive collection of hybrid forms of *Primula nivalis* [?] was exhibited by Mr. Calder, sculptor, Bellevue, Edinburgh, an amateur who has for some years past given close attention to the improvement of this interesting and beautiful species and its allies. The variety of colour, ranging from pure white to rose, purple and crimson in various shades, and the increased size of the

flowers and trusses, are very striking features of the improvement effected when compared with the pretty but diminutive parent of the stock. The collection was awarded a First-class Certificate. Messrs. Methven & Sons exhibited a very handsome medium-sized Cucumber, named *Edinburgh Beauty*; the texture and flavour were excellent, and a First-class Certificate was awarded it. *W. S.*

ORCHID NOTES AND GLEANINGS.

MASDEVALLIA WENDLANDIANA.

THIS is an introduction of Mr. Sander's from New Grenada, and is a *Masdevallia* of unusual interest because, so far as I am aware, it is the only species in cultivation that requires tropical treatment. It is one of the smallest of the genus, the leaves being from 1 to 2 inches in length, and about a quarter of an inch wide. It is, however, far too pretty and interesting to be relegated to that dubious group known as "botanical curiosities." It was described by Dr. Reichenbach in these columns a little over a year ago, and was referred to by him as a "lovely gem." The flowers are freely produced, and measure two-thirds of an inch in length. The prevailing colour of the flower is pure white, but a few dull purple lines occur on the outer side of the sepals, and they are orange-coloured at the tips. But few plants are at present in cultivation, and one of these is now flowering at Kew. It is best grown in small baskets or shallow pans of fibry peat, with a surfacing of sphagnum, and should have a shady place near the glass in the warmest house.

PLEUROTHALLIS INSIGNIS.

ALTHOUGH the greater part of this large genus is composed of species worthless from the gardener's standpoint, there are several which are sufficiently curious or beautiful to deserve cultivation. Amongst these is *P. insignis*, a fine example of which is now in flower at Kew. *P. insignis* is said to be the largest flowered *Pleurothallis*, and this particular plant has flowers which measure very nearly 6 inches from the tip of the upper sepal to those of the lower ones; three such flowers occur on the spike. The sepals and petals are comparatively broad at the base, but contract abruptly into long attenuations. They are of a pale transparent green colour, with two or three longitudinal stripes of purple. A singular appearance is given to the lip by a dense circular tuft of hairs near the apex, showing the near relationship of this species to *P. glossopogon*. It is probably a native of Caracas, and thrives well under cool and moist conditions. *W. B.*

PLANT PORTRAITS.

CORDYLINA INDIVISA VAR. *DOCCEIANA*, *Illustration Horticole*, t. 40.—A variety with the edges of the leaves with narrow bands of white at the margins.

CYPRIPEDIUM AEGES, *Revue de l'Horticulture Belge*, April.

DICHRISANDRA PUBESCENS VAR. *TENIENSIS*, *Revue de l'Horticulture Belge*, April.—Stove plant, with lanceolate leaves, striped with white on the upper surface. Flowers rich blue, small, in terminal spikes, see p.

EICHORNEA (PONTEDERIA) CRASSIPES, *Gartenflora*, t. 1271.

GENTIANA CALYCOSA, *Grisebach, Gartenflora*, April 1, 1888, t. 1270 a.—Stems 5—6 metres high, leaves opposite, oblong acute; flower 1 inch long, terminal, blue, funnel shaped, with a contracted throat. Native of the mountains of northern California.

GESNERA LONGIFLORA, *Garden*, April 14.—Flowers deflexed, white, trumpet-shaped, with a long slender tube, and an expanded five-lobed limb. Leaves 2 inches long, sessile, oblong, crenulate.

IRIS SQUALENS, *Illust. Monatsheft*, t. 3, March, 1888.

NYMPHLEA MARLIACEA, *Garden*, March 31.—A seedling raised by M. Latour-Marliac, Temple sur Lot Garoune. It is said to be quite hardy, and to be closely allied to *N. tuberosa*. The flowers are of a beautiful canary-yellow, so that even in the tropical aquarium it is amply deserving a place, particularly as it remains in bloom so long. The illustration, unfortunately, affords no means whatever of ascertaining what the affinities of the plant really are. It is a yellow Water Lily, and it is nothing more. Not even the disposition of the air-canals in the leaf and flower-stalks respectively is indicated, though a momentary inspection of these tubes with the unassisted eye would be sufficient to show to what section of the genus the plant belongs.

OONTOGLOSSUM TRIPUDIANS, *Orchidophile*, April, 1888.

PLEUROTHALLIS ROEHLII, *Orchidophile*, March, 1888.

PRIMULA SINENSIS VAR. **EDMOND MORREN**, *Illustration Horticole*, t. 42.—A variety with pale slaty-blue flowers obtained from seed by M. Edmond Morren.

ROSE HON. EDITH GIFFORD (TEA), *Garden*, April, 1888.—A cross between *Perle des Jardins* and *Madame Falcot*. Flowers white; habit vigorous. Raised by J. B. Guillot fils.

STATICE EXIMIA, VAR. **IRKUSTANICA**, *Regel, Gartenflora*, April 1, 1888, t. 1270 D. M.—A pretty species, with small lilac flowers in dense panicle clusters rising from the centre of a tuft of oblong acute leaves.

HOME CORRESPONDENCE.

A PLEA FOR THE IVY.—I fear the article of your correspondent in last week's *Chronicle* respecting Ivy being a parasite of a very destructive character, may have a very misleading and injurious effect in inducing its removal from trees, and old ruins, which it undoubtedly preserves. The Ivy is not a parasite, it never enters into and feeds on the life of other trees, like Mistletoe. It must have a separate existence, and unless it has soil or the debris of old buildings to root in it necessarily perishes. Most lamentable mistakes have occurred with respect to ivy growing on trees, which are seldom injuriously affected by it, as every large plantation and very many ancient trees throughout the country can testify. In fact, there is a remarkable sympathetic influence existing between Ivy and trees of a very accommodating nature, for if living Ivy of large girth is removed from the trunk of a tree it will be found that scarcely an indentation or even impression is left, but when it is ruthlessly removed in part, or killed from any cause, it then becomes a dead inert substance which will in all probability strangle and kill the tree. I remember some years ago visiting a fine park, and near the mansion were some grand Elm trees upwards of 100 feet in height with a luxuriant growth of Ivy hanging in graceful festoons from their summits and presenting, especially in the winter season, a beautiful appearance. I again visited the same place not long since and was horrified at finding an attempt had been made to cut the ivy, and as the greater portion could not be reached it remained dead upon the trees, with the natural result. It appeared the gentleman was told by some injudicious person that unless the Ivy was removed, it would destroy the trees, of which he was very proud. He discovered his mistake only too late, I trust this notice will prevent any undue destruction of one of the most beautiful features of our English landscape, *W. H. Rogers, Southampton*. [The use of the word parasite was unfortunate. If the walls are in fairly good repair, Ivy does no harm to them. Ep.]

TURF PITS.—Do we make enough use of these simple aids for the early production of Salads, Turnips, Potatoes, Radishes, Cauliflowers, Violets, Hellebore, Wallflowers, Stocks, and the protection in bad weather of many other things? For want of pits built of brick, which are expensive, and therefore avoided by many owners of a garden, some gardeners do not grow so much of the much-liked early productions of the garden as they might do if some of these much less costly makeshifts were put up by him. Not much labour is wanted, and that little can always be supplied by the "handy man" found about most places. Turf, preferably that of a peaty nature, as it has plenty of tough fibry roots in it, and con-

sequently is enduring to a greater degree than other turf, should be cut of a thickness of 3–6 inches, according to the depth to which the roots penetrate. The dimensions are best when the turves are 1 foot broad and 2 feet long; and the depth, breadth, and length, should be carefully preserved in cutting them, as this greatly assists the workman in the building of the walls. A dry, warm, sheltered spot should be chosen for the site of the pits, and where forcing by means of leaves is intended, holes of the width and length intended to have the pits should be dug out to a depth of 1½–2 feet; the turfen walls may be made 1 foot in thickness and 2 feet high at the front, and 3–3½ feet at the back, if the lights to be used are more than 6 feet long; but if they are shorter than this a less high back wall will be better. The walls may have sharp stakes driven through them into the soil at 5 feet intervals; this will steady them, and on the top there should be wall-plate and rafters to carry the lights. There is no need to have finely painted and finished lights; but those of red deal, painted with Carson's anti-corrosion paint are good enough, and no putty should be used except for embedding the glass, but thick white lead paint only. There will be no drip if this be properly done, and repairs are easily carried out when required. Such pits are much warmer than those made of brick, and will keep out when properly covered up from 10°–14° of cold. For forwarding crops of Turnips, Radishes, seeds of Celery, Cabbages, Cauliflowers, and those of annual flowers of many kinds, the walls need not be higher than 1 foot in the front and 6 inches more at the back; and when a little fermenting material is employed under the soil in which the seeds are sown, the staple may be dug out 2 spits in depth, so as to afford space for it. Violets planted out in such pits always do well, and they are moreover very useful in the autumn and winter for various kitchen garden crops, which must be protected from the weather. In conclusion I would direct attention to the use the French and Belgians make of simple means in the garden, and thereby secure in our own markets the top prices for early stuffs, *vide* your last week's article on "Market Gardens and Orchards," p. 519. *A. B. C.*

THE DESTRUCTION OF SHOOTS OF FIR TREES.

—A large belt of trees on the west side of the gardens here have been suffering much of late, exactly as Mr. Michie describes at p. 526 of your last issue. The depredator here (to my certain knowledge) is that pretty little nimble fellow, the squirrel, well known to foresters. What drew my attention first to the destruction of the Spruce trees was the untidy appearance which the walks presented. Although swept in the morning they were often strewn with the little shoots before mid-day, especially if there happened to be any wind. As this mutilation was going on in other woods on the estate, the question arose as to the cause of this devastation. A relation of mine wrote some time ago about the squirrel, and mentioned that this creature would have to be kept within bounds, as it was destructive to trees; recalling this to mind I kept a look-out, and soon saw what convinced me that my friend's statement was correct. Two squirrels were observed nibbling as fast as they could on the very top of one tree—the other far out on one of the branches. Before I had finished looking through the wood I had seen about a dozen. These squirrels came from some other plantations at a distance off which were being cut down. Now that the game-keeper has destroyed many of them the depredations have ceased, and the walks and ground about the trees remain clean. I have observed at times a few starlings flying about, but have never noticed them alight on the trees where this injurious prunning was being carried on. *J. Jeffrey, Cyfarthya Castle, South Wales*. [Other correspondents write to the same effect. Ep.]

DOUGLASIA.—The charming little *Douglasia levigata*, figured in your last issue, will always be full of interest to admirers of Dr. Asa Gray, as the seeds of this plant were probably the last he sent to this country with his own hands; with the note "a new *Primuloid* of great beauty," and such it has turned out to be, and in all probability it will prove hardy during our severest winters. During the past season, at any rate, the plants here have only had the protection of a cold frame, and are now in robust health, flowering as profusely as any of the European *Androsaces*. *D. levigata* was first found on Mount Hood, Oregon, May, 1850, by Messrs. Barrett, Howell, and others, and was described the same year in the *Proceedings*

of the *American Academy*, p. 105. The genus was founded by Lindley, in 1827, in honour of the traveller Douglas of the Royal Horticultural Society, who found the first species, *D. nivalis*, near the source of the River Columbia, 12,000 feet above sea level, on the Rocky Mountains, early in April, blossoming freely while thickly covered with snow, and is probably the hardiest of the American species. It was called *Androsace linearis* (Graham) in the *Edinburgh Philosophical Journal* for July, 1829, but is now probably lost to cultivation. The variety *dentata* is somewhat larger and looks as if it would be a better garden plant. The other American species are *D. montana* and *D. arctica*, neither of which are found in our gardens. We raised *D. levigata* last summer, and it commenced to flower early in October, continuing in bloom all through the winter, and is just now past its best. The only European representative of this genus is the well-known *Gregoria* (*Androsace*) *vitalliana*, found so plentifully in Switzerland and elsewhere. It is fairly common in our gardens, although rather tardy in producing its golden-yellow blossoms. *D., Kew*.

CYCLAMEN COUM.—Readers of the *Gardeners' Chronicle* will be interested to hear, no doubt, that I have received tubers from a long naturalised colony growing in the neighbourhood of Kingsbridge, South Devon. There is, indeed, more than one such, as I am told that it grows in two woods three miles apart, and that it is said to be found five miles off in another direction. My correspondent hears, further, that it grew in certain rectory grounds (presumably not cultivated) before alterations were made. He says:—"The folks here declare they are wild, and that they have grown in these two spots as long as they can remember." I am requested not to name the localities, and naturally refrain from such a well-known risk, though, indeed, like some places around I have wanted to visit, they are not too near a railway station. This plant has thus, it appears, been fairly well established; and as the circumstance of its being naturalised was unknown to Professor Babington it is probably without record. The plants came in flower and agreed in every particular with the figure in the *Botanic Magazine*, t. 4. *R. Irwin Lynch, Botanic Gardens, Cambridge*.

SINGLE DAFFODILS BECOMING DOUBLE.—On the confines of the New Forest there lies a field, which is in due season carpeted with a sheet of single daffodils. These being lifted and planted in a garden well known to me, remain single for one year. The next year the whole of them become double. There is also a circumstance which may throw some light on the question, and which is quite new to me. The change from the single to the double state is accompanied by a large development both of leaf and stem. In fact the little single produces a big double daffodil. I visited the garden yesterday, and sent off specimens. They are in the garden, and under the care of a neighbour, a highly intelligent and observant lady, whose evidence I can completely trust. *R. Trevor Clarke*. [With this came ordinary daffodils, large *Telamoni*, and one or two intermediate small *Telamoni*. Ep.]

GROUPS OF CHRYSANTHEMUMS FOR COMPETITION.—I do not think "R. D." has seen the best groups of *Chrysanthemums* staged or he would not write so disparagingly of their points as he does on p. 532. Neither do I think he can have examined the groups very closely, or he would not say "the flowers are generally borne on plants grown on a single stem." Very few growers indeed resort to the one-stem method of producing cut flowers for exhibition, let alone for grouping, except in very few instances, where late cuttings are inserted of special varieties, with a view to assist the groups somewhat. [It was general.] The plants are generally grown with from three to six stems apiece. The chief aim and ambition of a grower of plants for a group is to preserve all the foliage down to the pot. Now, if the practice of allowing Ferns and other foliage plants is enforced growers will get careless as to the preservation of the foliage of their *Chrysanthemums*, because they will know good foliage will not then assist them any more than naked stems, because those plants which are added to the groups will hide these signs of defective cultivation. I say, let the addition be optional, and I dare to say that few would object to hide the pots only with Ferns, but I fancy that those whose plants possess good foliage would prefer to depend more upon this rather than on the artificial hiding of the stems for their chance of winning prizes. Would "R. D." give a 1st prize to a

group of Chrysanthemums with artificial covering of the stems rather than to one of plants with perfect foliage down to the pot, assuming the flowers to be of equal merit in both groups? If he says "yes," then high culture may be ignored, and that should not be the aim of good horticulture. If "R. D." had seen the best groups, as staged at Kingston, I do not think he would be so hard upon the growers of Chrysanthemum groups as he is, judging from his remarks. S.

VIOLETS.—The time has arrived when preparations for next winter's supply of flowers should be

pared, by being dug over a spit deep in the winter months and have in it a considerable proportion of leaf-mould, or what will do almost as well, old potting-bench refuse soil. The runners and divided crowns should be planted firmly in rows a foot apart each way, care being taken not to bury the base of the crowns below the surface, as sometimes done when left to young hands. After-treatment will consist chiefly in watering as often as becomes necessary, at no time should they suffer from want of this, and in keeping the borders free from weeds by frequently stirring the surface with a Dutch hoe. When the plants have become

do best on a north border, whilst in our own case several years' practice proves a west aspect to be the most suitable, and in the ungenial climate of Lancashire we can fully imagine that even a south border or open situation would be required. The best plan to adopt in a garden where there is uncertainty on the point is to grow the plants for a season in diverse aspects and situations; afterwards keep to that which proves the best. *J. Horsfield, Heytesbury.* [A position partly shady, as that between the rows of bush fruit, does very well, and in such places the plants suffer little from spider. Ed.]

FRUIT TRANSIT RATES AND FRUIT SALESMEN.—Being not a Hampshire but a Kentish fruit grower I should like to notice the rates charged by the South-Eastern Railway Company, whose main line runs through this county, and is one of the chief routes for the conveyance of fruit, vegetables, &c., from the Continent. My nearest station is Halstead, and so great are the consignments of fruit hence during the Strawberry season, that a special train is run from Halstead every morning. Now, the rate of carriage from this station is 3*d.* for every peck of 12 lb., and 1*s.* 3*d.* for every box of 60 lb. weight, and distance to Covent Garden Market is twenty miles. Contrast these charges with those made by the same company for packages from Paris to the same market, which are 7*d.* per pad up to 28 lb., or £2 per ton; added to this the company's servants do the whole of the portage, which is considerable, and consists of unloading from the train to the boats and again from the boats to the train, and again into vans at the London terminus. Here the grower has to assist in loading and unloading his own produce, and pays at the same time equal rates with the foreigner, who has to send his produce twelve times the distance. Were it not for the quickness of transit the growers of soft fruit could take to the road in vans, and convey the fruit in vans for £1 per ton, and the fruit would then not receive so much of the rough handling it does now. As regards commission—this differs with different salesmen—one will charge a certain percentage on the whole of the goods sold, another will charge on each separate peck, bushel, or box. Take Strawberries, at 3*d.* per peck commission, which is the usual charge, the average price for the last three years has been 2*s.* per peck, and there is a commission of 12½ per cent., not on small quantities either, for I have sent from 300 to 500 pecks per day, and the percentage charged is not only too high but is bad for the grower. The salesman is perfectly indifferent, for whether he makes 5*s.* or 2*s.* per peck, his 3*d.* commission remains undiminished, and the quicker he can clear his stand the better he likes it. Mr. J. B. Thomas no doubt has a just cause to complain of the treatment meted out to his empties; the grower also has a complaint on this head. My neighbour, also a fruit grower, estimates the loss per acre of Strawberry pecks at £8, a statement I can fully endorse. The salesman has this advantage over the grower, he can and does charge on his empties. But with the exception of Mr. James Lindsey, of Edinburgh, I never knew a salesman to credit a grower with empties. There is another grievance which growers have to complain of, viz., a grower expects his returns every day from his salesman and his account to be accompanied with cash every week. A few carry out this system, but I am sorry to say not all, and now it is common for a grower to have to wait for twelve months or two years, and to be told that credit has been given to retailer, notwithstanding the grower has his hundred and one expenses at home, and cannot be banker for all. *W. Dale.*

FIG. 77.—KNAUR ON TAXODIUM DISTICHUM. (SEE P. 563.)

taken in hand, *i.e.*, with those intended to be flowered in frames, or indeed, for the matter of that, with those intended for flowering out-of-doors—although in this latter case, and where outdoor grown plants alone have to be depended upon for young stock, the operation will be somewhat later than usual this year, by reason of their lateness in flowering. It is a good plan to have prepared runners to begin with, and where it is the practice to adopt frame culture for the winter months there ought not to be any difficulty in being able to command a good supply by the end of April. Old roots may also be divided into single crowns for this purpose, but they do not produce such large flowers as those obtained from early rooted runners. As to soil, although a rich one is not really necessary it yet should be specially pre-

well established, and begin to throw out runners, the latter should be cut off as fast as they make their appearance, or, at least, they must not be allowed to make headway, the object being to concentrate in the crowns originally planted all the vigour possible. The greatest enemy will undoubtedly prove to be red-spider, and in some localities this is a pest indeed, putting at defiance almost all efforts to obtain successful results. It is next to impossible to prevent the attacks of this insect more or less, but a very great deal may be done in mitigation by selecting the most suitable position or aspect for the border, and we cannot write anything definite or precise on this point, as in different districts it will be found by experience to vary considerably. In the Eastern Counties we have found plants

THE MASSING OF ROSES.—Uncontrollable circumstances have thrown me out of the reading for several weeks, hence I have not noticed "Theta's" somewhat severe criticism until now. Neither am I careful to answer it at any length. The field of Roses is fortunately so large and full, and tastes differ so widely as to their individual merits and adaptation for special uses, that the most natural and useful thing in the world is for rosarians to differ. The old saw, "When doctors differ who is to decide?" is not applicable here. In such Rose matters as those under consideration no decision is needful. Were it possible, it would injure rather than advance the interests of those rosarians who are desirous of turning the decorative capacities of the Rose to more telling and effective landscape purposes. As to the merits of individual Roses—either included or excluded by me—it is only needful to say that my list made no pretence to perfection, far less to exhaustiveness, and it would have served a

useful purpose had it done nothing more or better than call forth "Theta's" critical corrections and additions. Instead of one list of Roses—many of which, according to "Theta," are of very little use—we have two, which probably have more; and if your readers find "Theta's" selection superior to mine, so much the better for the effective grouping of Roses—the one object I had in view in the writing of the somewhat fragmentary article. The energetic help of a good many, old as well as new friends will be needed before groups of Roses will assume the place and power in English landscapes that their freshness, brightness, beauty, and fragrance, so well fit them for; and the principle that the more writers and lists the merrier, that is, the better for fostering the grouping of Roses. I fairly can do and defend my selection against "Theta's" criticism. A little more of the fragrance of the Roses we both love so well infused into the spirit of his letter would have restrained such an accomplished rosarian from writing the following sentence:—"Madame Favart is not very well nor generally known; perhaps 'Rosa' will kindly describe it, and give its date and raiser." Few can know better than "Theta" that there is no such Rose, nor could read more readily between the letters that this was a mere misprint for Madame Lambert. As I was careful to define the special distinction I set up between the massing and grouping of Roses (p. 362.) "Theta's" opening remarks on this matter (p. 459) are equally uncalled for and devoid of sweetness or light. *Rosa*.

SULPHURIC ACID FOR DESTROYING WEEDS.—I notice that Mr. Horsefield recommends arsenic for destroying weeds on walks, drives, &c., and cautions people as to its application—a warning which is very necessary in the use of so dangerous a substance; but why have anything to do with it at all when sulphuric acid may be had so cheaply?—and though this requires care, there is nothing like the risk there is with arsenic, for at the worst only blistered hands are to be apprehended if the liquid is carelessly poured out before being diluted, and holes may be burned in the clothes if the acid is spilt on them. If those who have used this weed destroyer will give their experience of it they will confer a benefit just at this time. *J. S.*

PATCHOULY.—In connection with the subject of Patchouly, referred to in the notes on Mincing Lane products in last week's issue, I may state that Patchouly leaves are now coming into the market in quantities, forty-six bales having arrived last week from Singapore. The quality, however, is reported to be very indifferent. *J. R. Jackson, Kew*.

STRAWBERRY CULTIVATION IN POTS.—When visiting the gardens at Ashgrove, Sevenoaks, recently I was much struck with the Strawberries grown in pots. The variety chiefly cultivated is Princess of Wales [Knight's?], and which is a great favourite with Mr. Thorne, the gardener. In one of the houses there were to be seen some 500 berries just on the point of ripening, the colour and flavour being excellent. *S. C.*

LOSS OF SHOOTS OF SPRUCE FIR.—The destruction of young shoots of Spruce Firs referred to in your last number by a correspondent in Banffshire is not confined to that district, similar damage in this part of Kent having been observed for some time past, and which puzzled me much as to who were the depredators. They have, however, been caught in the act, and proved to be squirrels. They seem to prefer the *Abies excelsa* or common Spruce to the *A. Smithiana*, though common Silver Firs have not escaped injury. It may be that the severity of the weather has reduced their usual supply of food and hunger compelled them to feed on the Fir shoots. The mischief they have done is scarcely credible, and some trees have been denuded of all their fresh growth. *J. T. Herrett, Hawkhurst*.

EUCHARIS AMAZONICA.—Mr. Keetley answers my last at considerable length, and mostly agrees with what I wrote on March 31. I can quite understand that it is possible, if he has a lot of diseased *Eucharis* placed with healthy plants, the mites will attack the healthy ones. My contention is, that if the collection is maintained in robust health, there is very little fear of mites or fungi attacking them. I also maintain that it is beneficial to them after flowering is over, to take them to a cooler temperature, say 10° lower. I find, that if I leave them in the stove to flower a second time during the same season, the flowers are very small. *A. Macdonald, Cheddle*.

THE ORCHID HOUSES.

CATLEYA-HOUSE.—The division is beginning to look gay with flowers of *C. Mossie* and *C. Mendelii*, and pleasing when these are contrasted with those of *C. Lawrenceana* and *C. Skinneri*.

Watering.—During the next three or four months watering will be the most important part in Orchid culture, and should be attended to daily, and previous to cleaning and potting. All plants in the cool and East Indian-houses should be looked over daily if bright weather should prevail, and any plants that show signs of being dry (except newly potted plants, which may be damped over the surface) should be watered. If the surface of the compost should become close in texture, and does not take water freely, it should be pricked up with a pointed stick or be top-dressed. Very few Orchids thrive if the compost is continually saturated with water, it becoming sour quickly. *Catleyas* and *Laelias* do best if allowed to become nearly dry before water is given them, but no rule can be laid down for watering, but this must be determined by those in charge, as some plants will dry faster than others, and this will arise from various causes, such as the thickness of the shading used, the moisture in the house, the amount of ventilation given.

Calanthes, &c.—Many of the evergreen *Calanthes* will soon be in flower, and some weak manure-water afforded them once a week will enlarge the size of the blooms. A close watch must be kept on insects, to prevent injury to the latter. The foliage of these *Calanthes* is so very tender that it is not safe to fumigate them, but a few puffs from Bloxham's fumigator directed towards the spikes will assist in keeping them free from aphids. I find these plants grow best at the north end of an East Indian-house, about 2 feet 6 inches from the roof. *Odontoglossum coronarium* should receive plenty of water now. I find it grows best during summer if sufficient moisture be afforded it to keep the sphagnum green, and it grows freely when suspended in a long basket in the shadier part of the Lycaste-house. *Pleiones* that are placed near the roof and are well rooted should be carefully watered, giving some weak manure about once a week. *C. Woolford, Downside, Leatherhead*.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

TUESDAY, April 24.—Present: Dr. M. T. Masters, in the chair; Messrs. Michael, O'Brien, Pascoe, Burbidge, Dr. Scott, Professor Church, and Rev. G. Henslow (Hon. Sec.).

Daffodil, Fringed.—Mr. Burbidge gave the following further particulars about the remarkable form described at the last meeting. He said that there existed but a single clump in the lawn of Rev. Mr. Gabbett, Croom Rectory, by Limerick. The flowers had come true for several years. It was associated with *N. spurium* and *N. Telemonius* (plenus), the former seeding itself. It appears to be a sport from *N. spurium*, but nothing certain is known of its actual origin.

Hyacinths, Self-Mutilation of.—Specimens of this not uncommon phenomenon were sent from Colonel Urquhart, of Rosebay, Broughty Ferry, for information as to the cause. The spikes have the appearance of being pinched off when first emerging from the bulb. The cause is apparently twofold; on the one hand, the bud-scales at the top are too rigid, while on the other the spike was well nourished, the result being, that the insufficient expansion of the scales checked the development of the spike at the place where it becomes decapitated. The probable explanation was the excessively fine season of 1887, the "ripening off" bringing about the rigidity of the bulb-scales, at the same time favouring the formation of the spike within. Mr. Burbidge observed that it is a noticeable fact that the Chinese gash their bulbs with three slits at the top, to allow of the free escape of the spike, and to prevent such constrictions.

Hazel Catkins, Proliferous.—On a further examination of the Hazel brought to the last meeting by Dr. Masters from Mr. Syme, Mr. Henslow observed that, besides bearing female catkins at the base of the male, the latter were proliferous, the basal branches being covered with staminate flowers resembling the

so-called "Egyptian Wheat," on which several of the spikelets grow out into ears; so that five or more may proceed from one stalk. These two peculiarities—the proliferous state of the male catkins and the presence of female ones—corroborated the conclusion arrived at by Mr. Meelian, of Philadelphia, who observed in various declivous trees, that the female flowers were always associated with a relatively greater degree of vigour; or conversely, that an increased vigour produced female flowers, when normally nothing but male would have appeared.

Eucalyptus, Hardiness of.—Dr. Masters read communication received from M. Naudin, in which he speaks of the hardiness of *E. urnigera* at Brest and elsewhere, where it is subject to occasional severe frosts. He says that *E. coccifera* was compare favourably with it, as also *E. viminalis* (falsely called *E. amygdalina*) which is nearly as hardy. The last severe winter has shown the different degrees of hardiness among the various species of *Eucalyptus*. He says that a considerable number, even of very young trees, were absolutely insensible to the frost, while others, much larger and older, have had their foliage more or less damaged. Even *E. globulus*, usually so hardy, has had some of its leaves frozen, principally through the melting of the snow by the sun's heat. Mr. Burbidge remarked on the general presence of bloom or wax on the young leaves, and its absence on the older—probably a provision against too great transpiration in the young state. Mr. Henslow offered a similar interpretation of the semitar-form of the older leaves to that of the obliquity of Pears and Fir cones. When the stalk stands at an angle with the vertical, the weight of the leaf acting vertically downwards, the tension being along the stalk, the leaf consequently grows much more on the outer side to meet the strain of the resultant of these two forces—the vertical position, as of that of the stipules of *Acacia*, being probably adaptations to avoid too great radiation in the dry climate of Australia.

Plants Exhibited.—*Anemone Fanninii*, from South Africa, a large plant, with lobed orbicular hairy leaves and large greenish-white flowers. *Befaria glauca*, from Colombia, and called the Andean *Rhododendron*; the flowers are pink, nearly regular, with seven petals and fourteen stamens. It is the representative in the southern of the *Rhododendron* of the northern hemisphere. These two were received from Kew, and Botanical Certificates unanimously awarded to them.

Plants Sent for Name.—*Epidendrum tridactylum*, with small greenish flowers, of no beauty; *Pleurathallis insignis*, with slender pale grey lobes to the perianth; *Pinguicula grandiflora*, and the pink variety from the Alps of Dauphiné, above Grenoble; *Nymphaea tuberosa* var. *flavescens*. A protest was made against the name "*Mariacea*," furnished with the specimen, as tending to establish a confusion with the true name as given above.

Narcissus Committee.

A meeting of the Narcissus Committee was held in the Drill Hall on Tuesday, April 24, when Mr. Schoobred sent some blooms of the double *Pseudo-Narcissus* from the same lot as those described in the pages of the *Garden*, p. 356, which he guaranteed to have been planted by him originally single, and to have been converted into double flowers.

Mr. Boyd, of Melrose, sent a pale-coloured form of *N. minor*, said to be naturalised there in great abundance.

From Mr. Dawson were received a number of varieties, including *N. Johnstoni*, and some of those collected and sent home by Mr. Tait under distinctive numbers; small sulphur forms of *pallidus præcox*, and others. Mr. Corder brought a number of Portuguese forms of yellow *Ajax* collected by him.

Captain Nelson showed a seedling believed to be from *N. cernuus pulcher* × *J. B. M. Camm*, which he had named *Galatea*. It was of a most robust habit, and was much appreciated as being distinct and beautiful. It was agreed to defer registering it until the stock should have been somewhat increased. Also a seedling from *N. John Nelson*, and one from *N. cernuus pulcher* crossed with some form of *N. bicolor* or possibly *N. princeps*. Miss Owen brought a fine white *Ajax*, which was thought to resemble the one known as *Butterfly*; bulbs were requested for Kew.

Mr. Wilks sent a fine seedling from *N. Troilus*, which he called *Cressida*. It was much larger than the parent; and a seedling *Telemonius plenus*, raised from a bloom of the ordinary double form.

Mr. Marsh brought a white *Ajax*, collected wild

in Great Britain. Mr. W. Barr showed a variety collected last year, which he proposed to call *Sancta Maria*. It was of a fine deep yellow colour, and was deferred to another season; also a variety of *N. Incomparabilis*, which was registered as *Duchess of Westminster*. This he had proposed originally to name as *Flora Macdonald*, but it had been altered subsequently. Other well known garden varieties were named for various senders. *C. R. Scots-Dickens*, *Hon. Sec.*

LINNEAN.

APRIL 19.—The President, Mr. Carruthers, F.R.S., in the chair.

Mr. George Murray exhibited some specimens of *Spongocladia*, with explanatory coloured diagrams, and made some interesting remarks on the presence of sponge-spicules on Algae at present unaccounted for.

Mr. D. Morris, of Kew, exhibited and made remarks upon the bird-catching Sedge, *Uncinia jamaicensis*.

Mr. John R. Jackson, of Kew, exhibited some table mats from Canada, made of the highly scented grass, *Hierochloa borealis*, and a sample of the so-called Pine wool, prepared from the leaves of the American long-leaved or turpentine-yielding Pine, *Pinus australis*, with a mat made from the wool—an industry which has recently been started on a large scale at Wellington, North Carolina.

The first paper of the evening was by the Rev. George Post (communicated by Mr. Thiselton Dyer), and contained descriptions of new plants from Palestine.

A paper was then read by the Botanical Secretary, Mr. B. Daydon Jackson, on behalf of Professor Frean, "On the Flora of Water Meadows."

EDINBURGH BOTANICAL.

The fifth meeting of the present session was held in the evening of 12th ult., in the rooms, 5, St. Andrew Square, Dr. Craig, President, in the chair. At the outset the President, in the name of the Society, congratulated Professor Bayley-Balfour on his appointment to the Chair of Botany at the University, and to the appointment of Regius Professor of Botany and Keeper of the Royal Botanic Garden in Edinburgh, and Queen's Botanist in Scotland. Mr. Wm. Coates gave in a report on the excursion of the members of the botanical camp in Glenure, in the Appin district of Argyshire, in July and August last. Fifty-nine of the plants found had not been hitherto recorded in the district, and one, *Malaxis paludosa*, had not been seen in the district since it was noted by a minister of Killin a hundred years ago. On the whole, they found the district botanically a very poor one compared with Breadalbane. Mr. P. Sewell gave a paper in which he reviewed the state of our present knowledge of colour in plants; and he noted various conditions of environment, climate, &c., which affect the problem of explaining colour in plants and flowers. Professor Bayley-Balfour exhibited and described the Ginger-beer plant.

Royal Botanic Gardens, Edinburgh—Report for March, 1888.—The month of March was wintry in the extreme. Vegetation has made scarcely any progress. Outdoor work was seriously interrupted, much more so than during any month this winter. The thermometer was at, or below the freezing point on twenty-three mornings, indicating 131° of frost, collectively, as against 100° registered on eighteen mornings during the corresponding month last year. The lowest readings occurred on the 5th, 22^d; 17th, 21°; 21st, 22°; 26th, 22°; 28th, 20°. The day temperature varied very much. On the 8th the thermometer reached 59°, while on the 15th it did not exceed 30°. On the rock garden sixty-four species came into bloom during March. Of the forty spring flowering plants, whose dates of flowering are annually recorded to the Society, the following eleven came into flower, viz.:—*Sisyrinchium grandiflorum*, *Scilla bifolia alba*, *Mandragora officinalis*, and *Scilla bifolia taurica*, on March 8; *Sisyrinchium grandiflorum album*, March 13; *Narcissus pumilus*, March 17; *Scilla bifolia*, March 19; *Omphalodes verna*, March 23; *Draba aizoides*, March 30; *Orobis vernus*, and *Erythronium Deas-canis*, March 31.

Botanic Garden, Glasgow—Remarks on Temperature, Vegetation, &c., March, 1888.—The temperature was below the freezing point on twenty-four nights during the month, the lowest reading being 13°, during the night of the 16th; 10° were also registered during the nights of the 14th, 17th,

and 25th respectively. The remaining readings varied from 1° to 8°; total record, 128°.

Although a low reading, it is not unusually so. The causes of the month being so winter-like were the unusually heavy snow-storms, which were both frequent and of long duration. A few of the very hardy kinds of herbaceous plants bloomed at or about their usual season, but otherwise vegetation has made but very little advance since the end of January.

THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degree—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather for the week ending, April 30, is furnished from the Meteorological Office:—

"The weather has been cloudy or dull generally, but some bright intervals were experienced over England as the week drew towards its close.

"The temperature, as a whole, has continued considerably below the normal value, but during the latter part of the time it was rather above the mean for the season. On the earlier days of the period the maxima were generally as low as from 42° to 48°, but subsequently they were much higher, and readings of 65° or 66° were recorded in many parts of England. The lowest of the minima, which were registered either on the 26th or 27th, varied from 25° in 'Scotland, N.', to 34° in 'England, N.E.' and 35° in the 'Channel Islands.'

"The rainfall has been rather more than the mean in the north and west of Scotland, as well as in the north-west of England and south of Ireland, but in nearly all other districts it has been less. Over the greater part of England the fall was extremely slight.

"Bright sunshine shows an increase on that recorded last week, but has still been deficient very generally. The percentage of the possible amount of duration ranged from 12 in 'England, N.E.' and 16 in the 'Midland Counties' to 39 in 'Scotland, E.' and 43 in the 'Channel Islands.'"

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING MAY 12. (AVERAGE OF FORTY-FOUR YEARS.)

NOTICES TO CORRESPONDENTS.

A COMBINATION FRUIT: *T. F. R.* Much has been written on this subject to which we cannot find time for the moment to refer, but we will do so later on. In the meantime we have assuredly seen with our own eyes and tasted with our tongue an Orange one of the "quarters" of which was decidedly Lemon-like in colour, fragrance, and taste.

APPLES: *W. Coulton, and others.* The fruits had quite lost their characteristic appearance and flavour, and cannot be named. Send again when at their best.

APPLES FROM AUSTRALIA: *J. P.* The specimens were in a bad condition on arrival, owing to their having been insecurely packed, and they were also much over-ripe, so that no opinion of their merits can be formed. Better samples are displayed from the same source in the shop windows.

AUTUMN FLOWERING CROCS: *H. B.* Plant as soon as possible after the leaf decays.

BRITISH BOTANY: *H. L. The Flora of the British Isles, Hooker.* (Macmillan & Co.)

BROKEN LEADER: *R. H. B.* You cannot graft a new leader on to the broken stem; but should no shoots spring out just below the point of breakage, a side-shoot of sufficient strength may be fastened to a stout stake tied to the stem, and which will in time form a leader.

CORRECTIONS.—Owing to a printer's error, in "Peppermint as a Disinfectant," p. 532, line 23, the word "discovered" is employed instead of "distributed;" and in "Notices to Correspondents," "sulphur of potassium" instead of "sulphide," &c. — In "Hardy Perennials from Seed," ending in p. 524, at col. a, 8th line from end of article, after "hastening growth," insert the words "should be avoided."—In the report of the Royal Botanic Show, p. 535, col. a, of our last issue, Mr. James is credited with taking 1st for *Cinerarias*; this should have been Messrs. H. Cannell & Sons, of Swanley, Kent.

CUCUMBER: *L. P.* The roots have the appearance of having been attacked by the root-worm so often figured and described in these columns. Moreover, there are a number of mites present, but these probably only feed on the decayed root. The root-worms are probably introduced in the soil. We fear you can do nothing but burn your plants, turn out the soil, and start afresh.

ENEMURES: *J. J. I.* You must excuse us if we doubt your assertion, that our illustration was "astonishingly incorrect." We have not the slightest doubt that the artist—than whom a more competent is not to be found—accurately represented what he

saw. The specimen was furnished by the late Rev. Harpur Crewe. Either the plant is variable, or there is some error as to the nomenclature. At this distance of time it is impossible to arrive at a satisfactory conclusion.

FASCIATED NARCISSUS: *G. F. W.* A good specimen.

FRENCH BEAN CANADIAN WONDER: *T. Wickson.* This variety, otherwise Red-seeded Flageolet, has long been known as a good forcer, but the main objection to its more general use for early supplies is the height to which it grows. In roomy houses and pits, especially when it can be planted out, there are few better Beans. The pods sent were very fine ones.

GARDEN HOSE: *J. C.* The best kind of "hose" is made of short lengths of 3-inch gas-piping connected by means of short leather joints provided with screw unions. Each piece is mounted on four low castors, or wheels, which turn in every direction. It is dearer than any kind of india-rubber hose; but then it will outlast any other. Grey coloured india-rubber hose is the next best, and will last a long time if it is wound on a hose-reel after using. Some reels have hollow axles, and suitable connections with the hose itself, so that the latter may be used whilst partly unwound. We cannot recommend traders.

GOOSEBERRY BUSHES BREAKING BADLY: *D. B.* The damage is probably due to bullfinches. If the length of shoots bare of buds is an eyesore, cut the shoots back to the first wood-bud below the bare part. Kill the bullfinches next winter, or, better still, net the bushes.

INSECT: *T. F.* A weevil, most destructive; trap them at night with pieces of Carrot, and destroy.

LEAVES: *Mushroom Beds.* The leaves should preferably consist of Oak, Beech, or Chestnut; leaves softer than these will have decayed too much ere this to be of much service, and in any case would engender too great heat. Throw together with stable litter and get rid of the first rank heat before making into a bed.

NAMES OF FRUIT: *J. C., S. Bidl., and others.* Your fruits are out of character now; send earlier next season.

NAMES OF PLANTS: *J. K.* *Corydalis tuberosa.*—*J. W.* 1, *Erica*; 2, *Abies Nordmanniana*; 3, *A. Douglasii*; 4, *Thua borealis*; 5, *Pinus*, unknown; 6, *Abies Douglasii.*—*G. C.* We cannot undertake to name more than six: 1, *Anthurium Scherzerianum*; 3, *Conoclinium inianthum*; 8, *Pteris cretica*; 9, *Doodia caudata*; 10, *Pellionia pulchra*; 11, *P. Daveauana*; 12, *Cyrtodeira fulgida*; 13, *Eranthemum pulchellum*; 15, *Selaginella Wildenowii*; 16, *Asclepias curassavica.*—*J. C.* *Lathraea squamaria.*—*A. B.* *Rhododendron ciliatum.*—*W. H. D.* 1, *Rhododendron*, probably Countess of Haddington; 2, *R. virgatum*; 3, *Canna*, seed-pod; 4, seed-pod of a *Bignoniaceae* plant; 5, *Lilium longiflorum* var.—*P. R. O.* 1, *Cupressus Lawsoniana*; 2, *Adiantum formosum*; 3, *A. gracillimum*; 4, *Neprolepis pectinata.*—*No name (sent in a tin box).* *Rhododendron ciliatum.*—*A. P.* 1, *Oncidium leucobulum*; 2, *Lycaste aromatica*; 3, a *Torenia*; specimen not sufficient; 4, *Leucadendron argenteum.*—*H. May.* 1, *Saccolabium ampullaceum*; 2, *Cypripedium barbatum*; 3, *Calanthe (Phaius) Sieboldi*; 4, *Tradesantia discolor.*—*H. J. Ross.* *Eria pubescens.*—*T. D.* *Odontoglossum Ruckertianum.*—*R. A. G.* 1, *Pteris aquilina*; 2, not sent; 3, *Dendrobium fimbriatum*; 4, *Cypripedium barbatum*; 5, *Dendrobium thysiflorum*; 6, *D. chrysoxum.*—*African.* 1, *Albuca Nelsonii*; 2, *Cyrtanthus McKenii*; 3, a hybrid *Echeveria*; 4, *Cyperus laxus*; 5, *Myrsiphyllum asparagoides.*—*B. G.* *Cattleya intermedia.*—*J. Walden.* *Odontoglossum Coradinei* (a very large form).—*Banstead.* 1, *Asplenium lucidum*; 2, *Pteris Ouvrardi*; 3, *Asplenium funiculaceum*; 4, *Gymnogramma (Dictyogramma) japonica*; 5, *Pteris sinensis*; 6, *Blechnum occidentale*; 7, *Adiantum hispidulum.*—*M. F. D.* 1, *Oncidium altissimum*; 2, *O. sphacelatum.*—*W. M.* *Solandra grandiflora.*—*R. W.* *Veronica Hulkeana.*—*E. Günther.* *Anopteris glandulosa.*

NARCISSUS: *G.* Put the bulbs into the open ground without disturbing the ball of soil at all, not even taking out the crocks, giving water to settle the soil; and let them remain there until the foliage turns yellow, when you may take them up, planting again in October and onwards—the larger bulbs apart from the brood, which may be planted

at a small distance from bulb to bulb in line, to grow to a flowering size. Another way would be to plant the pots of bulbs on well-prepared ground, as before, and leave them alone to flower there for two seasons, afterwards taking them up and dividing them into sizes.

PARAFFIN OIL: *South Devon.* We have not before heard of this oil being used for killing weeds on walks, and know nothing of the mode of using it.

POTATOS: *R. H. B.* The tubers when cooked had a distinct flavour of the Onion, and the occurrence is doubtless due to your having manured the crop with the Rape-dust from the Onion loft.

SENDING PLANTS TO THE ROYAL HORTICULTURAL SOCIETY'S MEETINGS: *R. Johnson.* Write to Mr. A. F. Barron, Superintendent of the Royal Horticultural Society's Gardens, Chiswick.

SOIL, WATER, &c.: *E. W. P.* The water of your district is most probably derived from the greensand, and will contain a considerable amount of lime in solution. It is bad for many kinds of plants, and always causes discoloration of the leaves if used for syringing purposes. You should use rain-water for plants in pots, and for syringing these, and Grapes, &c. The soils sent were of good quality, but if coming immediately from the chalk it might be unsuited for certain plants. By stirring lime into a tank of well-water the particles of chalk will be attracted to it, and will sink to the bottom of the tank, when the water may be drawn off after standing for forty-eight hours. It will then be better fitted for watering plants. Catch all the rain-water you can, and use that. A good deal may be caught from glass-houses, pits, sheds, &c.

THRIPS ON VINES: *W. B.* Carefully sponging the foliage with some sort of insecticide is your only remedy in the present tender stage of the bunches.

VINE ROOTS: *P. R.* It is a natural thing for Vines to produce air-roots in a moist atmosphere. They do no harm.

VINES, CAMELIAS, AZALEAS, FLOWERING WEAKLY, AND BLOOMS FALLING OFF: *W. B.* Probably due to London fog. If your Vines were allowed to start naturally, the blooms would be less affected, as at that time of year there would be less fog.

COMMUNICATIONS RECEIVED.—*R. W. A., Natal.*—*M. F.*—*K. L. D.* (with thanks).—*H. H. D'O.*—*T. D.* *Blandford.*—*J. L. & Sons.*—*E. Versaet, Ghent.*—*H. N. & Co.*—*Rev. D. L.*—*J. J. S.*—*H. Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

DIED, at Sunnybank Nursery, London Road, Edinburgh, on April 26, Mr. JOHN MILNE, aged sixty-eight years.

MARKETS.

COVENT GARDEN, May 3.

Old Grapes being now finished, the demand for good samples of new ones will improve. All hot-house goods in fair supply, with business somewhat quiet. Prices remain the same. *James Webber, Wholesale Apple Market.*

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 4 columns: Vegetable name, s. d., s. d., s. d. Includes items like Artichokes, Asparagus, Beans, Beet, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Green Mint, Herbs, Leeks, Lettuce, Potatoes, Mushrooms, Mustard and Cress, Parsley, Potatoes, Rhubarb, Seakale, Shallots, Spinach, Sprue, Tomatoes, Turnips.

POTATOS.—Danbar Regents and Magnum Bonums, 120s.; Lincoln Magnum Bonums, 80s. per ton. Other samples fair-sized. Markets firm.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Fruit name, s. d., s. d., s. d. Includes Apples, Grapes, Kent Cobs, Lemons, Peaches, Pears, Pine-apples, Strawberries.

BEDDING-OUT PLANTS.

By the box, 1s. 6d. to 3s.; or by the dozen, 1s. to 2s. Now coming good.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Plant name, s. d., s. d., s. d. Includes Aralia Sieboldi, Azaleas, Bouvardias, Calceolarias, Cinerarias, Coleus, Cyclamens, Cyperus, Deutzias, Dracena terminalis, Ferns, Ficus elastica, Foliage plants, Guchias, Gnestas, Heliotropes, Lily of the Valley, Marguerites, Mignonne, Musks, Myrtles, Palms, Pelargoniums, Petunias, Roses, Spiraeas.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Flower name, s. d., s. d., s. d. Includes Anemone, Arum Lilies, Azaleas, Bouvardias, Camellias, Carnations, Cinerarias, Cowslips, Cyclamens, Daffodils, Dutch, Lilies, Lisianthus, Primulas, Ranunculus, Roses, Scilla, Tulips, Violets, Wallflowers, White Lilac.

*. Orchid bloom in great variety, but the demand not very good.

FRUIT AND VEGETABLES.

SPITAFIELDS AND COLUMBIA: May 2.—Large supplies of vegetables at market, for which a fairly good demand was experienced, the best qualities still in most request at the following quotations:—Cauliflowers, 2s. 6d. to 7s. 6d. per tally; Broccoli, 2s. to 3s. 6d. per bush; Spinach, 2s. to 2s. 6d. per sieve; Turnip-tops, 1s. 9d. to 2s. 6d. per sack; Greens, 4s. 6d. to 7s. per dozen bunches; Turnips, 2s. to 2s. 6d. do.; Carrots, 3s. to 4s. do.; Parsley, 3s. do.; Mint, 2s. to 2s. 6d. do.; forced Rhubarb, 1s. 6d. to 2s. do.; natural Rhubarb, 1s. 6d. to 2s. 6d. do.; spring Onions, 2s. to 3s. do.; Radishes, 1s. to 1s. 6d. do.; Horseradish, 10d. to 1s. 2d. per bundle; Mustard and Cress, 2s. to 2s. 6d. per dozen baskets; Beetroot, 8d. to 1s. per dozen; Endive, 1s. to 1s. 6d. do.; Cabbage Lettuce, 8d. to 10d. do.; English Onions, 7s. to 8s. per cwt.; foreign Onions, 5s. to 7s. per bag of 110lb.; Carrots, 4s. to 100s. per ton; Swedes, 2s. to 30s. do.; English Apples, 4s. to 7s. per bushel; American Apples, 14s. to 18s. 6d. per barrel.

STRATFORD: May 1.—Both trade and supply have been good. Quotations:—Greens, plain, 4s. to 4s. 6d. per bag; Turnips, 3s. to 3s. 6d. per dozen bunches; do., 35s. to 50s. per ton; Carrots, household, 60s. to 80s. do.; Mangels, 19s. to 22s. do.; Onions, Dutch, 6s. to 8s. per bag; do., Egyptians, 7s. 6d. to 8s. per case; Apples, English, 5s. to 7s. per bushel; do., American, 18s. to 25s. per barrel; Watercress, 6d. to 8d. per dozen bunches; Wallflowers, 3s. 6d. to 4s. do.; Spinach, 2s. to 3s. 6d. per bushel; Radishes, 1s. to 1s. 2d. per dozen bunches; spring Onions, 4s. to 6s. do.; Parsley, 2s. to 4s. per dozen bunches; Asparagus, 3s. to 4s. per bundle; Broccoli, 2s. 9d. to 3s. per bushel; Rhubarb, 2s. to 2s. 3d. per dozen bunches; Carrots, 3s. to 3s. 6d. do.

POTATOS.

STRATFORD: May 1.—Quotations:—Scotch Regents, 80s. to 95s. do. Magnum, 80s. to 90s.; English Magnums, lightland, 60s. to 80s.; do., blacklands, 45s. to 55s. per ton.

SANKEY AND SON'S GARDEN POTS.

From Messrs. MARSHALL BROS. AND CO., Barnham and Brighton, Agents for our Pots for Brighton and district.
 "GENTLEMEN.—The last consignment of 16,000 pots to hand in very good condition. We like your pots very much; they are light, and very durable, and we save fully £50 per annum by using them instead of our local pots."
 From Messrs. ARMITAGE AND SON, Nurserymen, Huddersfield.
 "We have used for over twenty years, and are still using and selling, only Sankey's Nottingham-made Garden Pots."

"BULWELL POTTERIES," NOTTINGHAM.

Carriage and Breakage Free on £10 Orders. Half Carriage and Breakage Free on £5 Orders.
 Samples (carriage free) gratis, prices free on application.

From Messrs. HARLEY AND SONS, Dundee and Perth, N.B.
 "We are very pleased with quality of your pots; we grow large quantities of plants for market, and find nice-looking pots make the plants look and sell better; yours are not only superior to others in colour and shape, but are not half the weight, yet stronger, neither do they turn green."
 From Messrs. WALSHAW AND SON, The Nurseries, Scarborough.
 "The pots are so superior over all others we have used that we shall have great pleasure in placing our orders exclusively with you."

Recently Completed, with 1937 Full-Page Coloured Plates.

SOWERBY'S ENGLISH BOTANY.

Containing a Description and Life-sized Coloured Drawing of every British Plant. Edited and brought up to the Present Standard of Scientific Knowledge by the late

J. T. BOSWELL, LL.D., F.L.S., &c.

THE FIGURES BY

J. E. SOWERBY, J. W. SALTER, A.L.S., and N. E. BROWN.

Third Edition, in 12 vols., super-royal 8vo, £24 3s., in cloth, £26 11s. in half-morocco, and £30 9s. whole morocco.
 Also 89 Parts, 5s. each, except the Index Part, 7s. 6d.

The Work has for nearly a century been the chief authority on English Botany, and in its present form may fairly be taken as the most complete representative of the present state of knowledge of British Plants.

LONDON: GEORGE BELL AND SONS, York Street, Covent Garden, W.C.

BOULTON & PAUL, HORTICULTURAL BUILDERS, NORWICH.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used **STANDEN'S MANURE** for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, one can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—**C. M. HOVEY, Boston, U.S.A., May 27, 1887.**"

Sold in **TINS**, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in **KEGS**, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS—

HORTICULTURAL PREPARATIONS

The Best and Most Effectual yet Introduced.

FOWLER'S LAWN SAND, for Destroying Daisies, Dandelions, Plantains, and other Weeds on Lawns, &c.; at the same time acting as a Fertiliser, and improving the Growth and Colour of the Grass.

Price, in Tins, 1s., 2s. 6d., and 5s.
Kegs, 28 lb., 8s.; 56 lb., 16s.; 112 lb., 30s.

GARDENERS' INSECTICIDE, for Destroying all the various Insects, Blights and Mildews infesting Plants and Trees. It is easily applied, either by Dipping, Syringing, Spraying, or as a Winter-dressing. Does not require cleansing off with water; will not stain or injure the most delicate Flower, Fruit, or foliage.

In Jars, 1s. 6d., 3s., 5s. 6d. and 10s. each.
In Kegs, 28 lb., 21s.; 56 lb., 42s.; 112 lb., 81s. each.

FOWLER'S MEALY-BUG DESTROYER, for the Special Eradication of this most troublesome of Stovehouse Plant Pests. It is easily applied, either with a small brush or vapouriser; is instant destruction to both Insect and Ova, and does not stain or injure the Foliage.

In Bottles, 1s., 2s. 6d., 5s., and 10s.
Half-gallon, 21s.; One Gallon, 42s. each.

POOLEY'S WORM DESTROYER, for Eradicating every kind of Worm from the Roots of Large Specimen Plants, Pots, Lawns, &c. It is easily and cheaply applied, and will not harm the most delicate plant.

In Bottles, 1s., 2s. 6d., 7s., and 12s. 6d. each.

EWING'S MILDEW COMPOSITION, for the Prevention or Destruction of Mildew on all Plants.

In Bottles, 1s. 6d. and 3s. each.

CORRY, SOPER, FOWLER & Co.
(LIMITED), SOLE MANUFACTURERS,
LONDON.

To be had from all Seedsmen and Florists throughout the Kingdom.

ORCHID PEAT, best quality; **BROWN FIBROUS PEAT** for Stove and Greenhouse use, **RHO-DODENDRON** and **AZALEA PEAT**. Samples and Prices to **WALKER AND CO.**, Farnborough, Hants.

To Market Gardeners, &c.

To Grow fine Vegetables and Flowers, Gardeners should use **SULPHATE OF AMMONIA**. One trial will prove the great value of this Measure, and ensure its constant use hereafter. It can be applied either separately or mixed with ordinary stable or farmyard manure. Rose Trees and Garden Plants are much benefited by being watered with a weak solution once or twice a week. Instructions on application, post-free. Price free on rail at Sheffield, 13s. per cwt., or 7s. per 56 lb. P.O. Orders payable to **The MANAGER, Sheffield Gas Company, Sheffield.**

GISHURST COMPOUND, used by leading Gardeners since 1859 against Red Spider, Mildew, Thrips, Green Fly, and other Blight. 1 to 2 ounces to the gallon of soft-water; 4 to 16 ounces as winter dressing for Vines and Orchard-house Trees; and in lather from the cake against American Blight. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from **PRICE'S PATENT CANDLE COMPANY (Limited)**, London.

THE "NEW EASY" LAWN MOWER.

Has an Open Steel Roller.

A man can work a 24-inch machine, cutting Grass 5 inches high clean to roots.

There is no easier working, no better finished, no stronger, no more durable mower in the market.

The Front Roller, with simple adjustment, enables the machine to cut very close to the ground, and to do fine work.

The machine will also cut verges.

To be obtained through all the leading Ironmongers or Seedsmen, or from the Sole Licensees—

SELIG, SONNENTHAL & CO.,
85, Queen Victoria St., London, E.C.

HORTICULTURAL GLASS.

A large quantity of all descriptions and sizes in stock, at the lowest possible prices.

NICHOLLS & CLARKE,
SHOREDITCH, LONDON, E.

The above sketches represent the newest and most effective form of Circulating Boiler for Heating Horticultural Houses, Churches, &c. This form of Boiler is particularly advantageous for shallow drainage. It has more direct heating surface than any other made heretofore of the same weight and depth. No skill is required in setting. The flue being continuous and undivided avoids all swirls or obstructions to the draft.

For further particulars apply to Messrs. MARRIOTT AND GRAHAM, Plantation Boiler Works, Glasgow; or the Patentee, **JAS. ANDERSON, 53, Woodstock Road, Belfast.**

SHANKS'S IMPROVED LAWN MOWER.

THE ONLY LAWN MOWER FITTED WITH DOUBLE EDGED SOLE-PLATE, Enabling the Cutting Parts to last twice as long as in other Machines.

THESE MACHINES are strong, substantial, and very easily worked. They make the Lawn like velvet, and are not liable to get out of order.

MESSENGER & CO'S New CATALOGUE of Greenhouses and Heating Apparatus,
 Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It is in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.
 A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.
MESSENGER & COMPANY, LOUGHBOROUGH.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

WANTED, a GARDENER!!!—Having had long experience and an extensive connection we are in a position to RECOMMEND MEN thoroughly capable of filling with credit any situation in the Gardening World. On receipt of full particulars we will recommend a suitable Man. Correspondence invited.—R. B. LAIRD AND SONS, Successors to Downie & Laird, Seed Merchants, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

Gardeners, Bailiffs, &c.

JOHN LAING AND SONS, having filled many important places, can RECOMMEND with every confidence, energetic and practical MEN of tested ability and first-rate character. Ladies and Gentlemen in want of Gardeners and Bailiffs, or Gardeners for first-rate establishments, or Single-handed situations, can be suited, and have full particulars by applying to us. No fees charged.—JOHN LAING AND SONS, The Nurseries, Forest Hill, S.E.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SCOTCH GARDENERS.—JOHN DOWNIE (of the late firm of Downie & Laird), Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

ADVERTISER is open to SELL SEEDS, &c., of every description for a good firm on Salary and Commission in one of the best districts in England. Eighteen years' experience in the Trade.—J. C., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

ORCHIDS.—A Man of first-class qualifications and character is at liberty to engage with a Gentleman to take charge of a Collection of Orchids, or combine that with the other duties of a Garden. He was a pupil of the late Mr. Spyers.—H. BURBERRY, Marks Ley, Essex.

GARDENER (HEAD), and ORCHID GROWER.—A thoroughly competent Man, now disengaged, is desirous of meeting with a fresh appointment. Has had many years' practice in first class places; has gained many prizes at exhibitions, and been very successful in Fruit and Vegetable Culture. References and testimonials of the highest order.—J. T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD).—Age 45, married; thirty years' experience. Thoroughly practical and trustworthy. Eleven years in last and eight in previous situation.—J. B., 55, Percy Road, Kilburn, N.W.

HOLLOWAY'S OINTMENT and PILLS.

Counsel for the Delicate.—Those to whom seasons of changeable temperature are protracted periods of trial should seek the earliest opportunity of removing all obstacles to good health. This cooling Ointment, perseveringly rubbed upon the skin, is the most reliable remedy for overcoming all diseases of the throat and chest. Quinsy, relaxed tonsils, sore throat, swollen glands, ordinary catarrh, and bronchitis, may be arrested as soon as discovered, and every symptom banished by Holloway's simple and effective treatment. This Ointment and Pills are highly commended for the facility with which they successfully conquer influenza; they allay in an incredibly short time the distressing fever and teasing cough.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1888.

The Winners of every First Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 140,000 of these Machines have been Sold since they were first introduced in the year 1856,

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2nd. They are worked with much greater ease than any other.
- 3rd. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

SILENS MESSOR MOWERS,

with Improved Steel Chains and Handles.

SINGLE-HANDED LAWN MOWER.

To cut 6 inches, can be worked by a Lady	... £1 15 0

SALES BY AUCTION.

Tuesday and Wednesday Next, May 15 and 16.

HIGHLY IMPORTANT UNRESERVED SALE OF ESTABLISHED ORCHIDS.

The First Portion of the celebrated Selborne Collection, by order of John Southgate, Esq., who is giving up their cultivation on account of ill-health.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from J. Southgate, Esq., to SELL by AUCTION, at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY and WEDNESDAY NEXT, May 15 and 16, at half-past 12 o'clock precisely each day, the first portion of this well-known collection of ESTABLISHED ORCHIDS, including many very fine specimens.

The plants are in the most perfect health, and comprise, amongst others, the following:—

- Cattleya exoniensis
Trianae eboracensis
labiata, autumn-flowering variety
Mossie Southgatei
Mendelii Selbornensis
Warnerii splendens
Laelia anceps albicaulis
Dawsoni
hammea
Lycaste Skinneri alba
Phaius tuberculatus, 10 leads
Angraecum Kotschyi
Calanthe Sedeni
Dendrobium nobile nobiliss
endocharis
Falconeri giganteum
Findleyanum giganteum
Sobralia macrantha, Woolley's variety
splendens, grand specimen
Vanda suavis, Veitch's variety, wonderful specimen
Sanderiana
teres aurora
Aerides Lawrenceae, Southgate's variety
Fieldingii, grand specimen
Lobbi
Dendrobium filiforme
Brassia authoritatis

The plants will be on view the morning of Sale. Catalogues are now ready, and may be obtained of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

Richmond, S.W., close to the Station.

UNRESERVED SALE of 18,000 well grown GREENHOUSE and BEDDING PLANTS, consisting of thousands of GERANIUMS of the best bedding varieties, CALCEOLARIAS, LOBELIAS, COLEUS, FUCHSIAS, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION on the Premises, The Richmond Nurseries, Richmond, S.W., on WEDNESDAY NEXT, May 16, at 1 o'clock precisely, by order of Messrs. G. & W. Steell.

On view two days prior to Sale. Catalogues had on the Premises, or of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C.

Finchley Road, N.W.

ANNUAL SALE, without Reserve, close to the Castle Hotel, and a mile from either of the Finchley Road Stations.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the Child's Hill Farm Nursery, Finchley Road, N.W., on THURSDAY NEXT, May 17, at 1 o'clock precisely, thousands of well-grown GREENHOUSE and BEDDING PLANTS, consisting of Geraniums, Calceolarias, 300 half-specimen Camellias, principally white; 400 Azaleas, Tree Carnations, 200 Cissas, 500 Tree and other Roses, Lilies, 1000 Maidenhair Ferns, 2000 Prize Pansies, and other Stock.

May be viewed two days prior to the Sale. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, E.C.

Friday Next, May 18.

VANDA TERES ANDERSONIANA, Splendid importation; the plants are in specially fine condition. SACCOLABIUM BLUMEI MAJUS. A grand lot of this showy Saccolabium, fine masses being among the importation.

ODONTOGLOSSUM VEXILLARIUM, A fine lot of the radiatum section.

CATTELEYA GIGAS, A superb and splendid lot of well-leaved plants.

Also good plants of ODONTOGLOSSUM HARRYANUM, the rare ONCIDIUM SPLENDIDUM, ODONTOGLOSSUM TRUMPHANS, a splendid lot of O. OROBANCHIUM, O. PHALANOPSIS, LELIA ACUMINATA MAXIMA, ODONTOGLOSSUM PESCATOREI, a fine lot of CATTELEYA AUREA; also a superb lot of the chaste and lovely LELIA ANCEPS ALBA, and varieties; ONCIDIUM LANCEANS, offered for the first time—a grand lot, in very fine masses; ODONTOGLOSSUM TRUMPHANS, importation of extra fine masses; O. SCEPTUM, specially fine lot; O. BLANDUM, ONCIDIUM BIFOLIUM and MAJUS, splendid masses; ORNITHOCHEPHALUS GRANDIFLORUS, splendid plants.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to SELL the above ORCHIDS by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, May 18, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Friday Next.—Without Reserve.

No plants will be sold privately prior to the Sale. Catalogues will be ready in due course, and may be obtained of the Auctioneers, 67 and 68, Cheapside, E.C.

The Broomfield Collection of Established Orchids.

Important Unreserved Sale of the Second Portion of the celebrated collection of ESTABLISHED ORCHIDS, formed by Robert Warner, Esq., who is giving up their cultivation in consequence of long continued ill health.

MESSRS. PROTHEROE AND MORRIS are instructed by Robert Warner, Esq., to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., at an EARLY DATE, the Second Portion of his well-known collection of ESTABLISHED ORCHIDS, without reserve. Further particulars will shortly appear.

Sale, Monday, May 14.

CYPRIPEDIUM SCHOENBURGIANUM.

Grand importation. Discovered by Richard Schomburgk near the Roraima Mountain as far back as 1842. In 1844, Mr. Im Thurn re-discovered it, but in another locality, no plants however came to this country alive. Mr. Kroner, our collector, found it in Schomburgk's original locality, and the plants having been under his care, have arrived in fine condition. In growth the plant resembles Pearcei, and it will be found of very easy culture, and should be grown in the Cattleya-house, and be kept very moist always. The flower-spike resembles that of C. Schlimii, and the flowers are about 2½ inches in diameter, they are of a deep brown colour, the dorsal sepal lighter and veined, pouch reddish, the sepals stand rectangular from the flower, and are very pointed. Schomburgk says, in the description of his journey, that he found "a new superb sweet-scented Cypripedium."

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on MONDAY, May 14.

On view morning of Sale, and Catalogues had.

Sale Monday, May 14.

RADIATUM and other extraordinary varieties of ODONTOGLOSSUM VEXILLARIUM.

MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY May 14, by order of Mr. F. Sander, a fine lot of ODONTOGLOSSUM VEXILLARIUM, consisting of the finest possible forms.

On view morning of Sale, and Catalogues had.

Sale Monday, May 14.

ODONTOGLOSSUM NEVAENSE.

MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on MONDAY, May 14, very fine plants of ODONTOGLOSSUM NEVAENSE. This fine Odontoglossum is extremely rare and beautiful, and very few exist in collections.

On view morning of Sale, and Catalogues had.

Sale Monday, May 14.

LELIA ANCEPS, White.

MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on MONDAY, May 14, a splendid lot of white LELIA ANCEPS, consisting of very fine masses in the best condition the eyes being sound and unbroken.

On view morning of Sale, and Catalogues had.

Sale, Monday, May 14.

VANDA TERES ANDERSONIANA.

MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, May 14, by order of Mr. F. Sander, a superb lot of the above grand VANDA. The Plants have arrived in specially fine order.

On view morning of Sale, and Catalogues had.

Sale Monday, May 14.

Instead of date previously announced.

CATTELEYA LAWRENCEANA, specially large and fine flowered variety. See dried flowers.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, May 14, by order of Mr. F. Sander, a specially large and grand importation of CATTELEYA LAWRENCEANA. This consignment has been collected in a quite different district, from whence no Cattleya Lawrenceana have ever been introduced. There is as much difference between this and the ordinary C. Lawrenceana as there is between the starchy variety of Odontoglossum crispum and the broad petalled forms. The dried flowers on view will give some idea of the magnificence of this variety.

On view morning of Sale, and Catalogues had.

Thursday Next.—(Sale No. 7682.)

SPECIAL SALE OF ORCHIDS IN FLOWER and BUD.

MR. J. C. STEVENS will SELL by AUCTION at his Great Rooms, 38, King Street, Covent Garden, on THURSDAY NEXT, May 17, at half-past 12 o'clock precisely, a fine lot of ORCHIDS IN FLOWER and BUD, comprising some splendid forms of Odontoglossum vexillarium, O. Pescatorei, and O. Alexandrae Cattleya Mendelii, and C. Mossie, a grand variety of Oncidium Macranthum; Cypripedium barbatum nigrum, C. Harrisonianum superbum, C. Hendersonianum, Masdevallia, Dendrobis, &c.

On view morning of Sale, and Catalogues had.

Sale Thursday Next.

Ten cases of a fine variety of VANDA SUAVIS, just received direct from Java.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, May 17. On view morning of Sale, and Catalogues had.

Beckenham, Kent.

JOHN SHARPE & SON,
SEED GROWING ESTABLISHMENT,
BARDNEY, LINCOLNSHIRE.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used **STANDEN'S MANURE** for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—C. M. HOVEY, Boston, U.S.A., May 27, 1887."

Sold in **TINS**, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in **KEGS**, at reduced prices, 28 lb., 12s. 6d.; 53 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS—

Rose Growers by Appointment to Her Majesty The Queen,

WALTHAM CROSS, HERTS,

RESPECTFULLY SOLICIT ORDERS FOR THE FOLLOWING NEW ROSES:—

DUCHESS OF ALBANY, H.P. (Wm. Paul & Son).—A sport from LA FRANCE, with flowers deeper in colour and larger in size than the parent variety. It has been fully tested at Waltham Cross, and has been greatly admired by all Rosarians who have seen it.

The *Journal of Horticulture* says of this Rose:—"It is totally distinct in colour, both surfaces of the petals being of a rich dark rose tint. In the bud state it is extremely beautiful. For bouquets, button-holes, wreaths, or indeed any decorative purpose it is admirable."

The *Garden* describes the flowers as "of a bright pink shade of colour, large and full, quite distinct from and much better than those of LA FRANCE."

Plants ready the end of May, 10s. 6d. each.

GRAND MOGUL, H.P. (Wm. Paul & Son).—A seedling from A. K. Williams; deep brilliant crimson shaded with scarlet and black. First-class Certificate Royal Horticultural Society.

Plants now ready, 3s. 6d. each.

SILVER QUEEN, H.P. (Wm. Paul & Son).—Silvery blush shaded with rosy-pink, very soft and pleasing; produced in great abundance; quite first-rate.

Plants now ready, 3s. 6d. each.

THE PURITAN, H.P.—One of the most beautiful and valuable of New Roses. White, large, handsome, and sweet; produced in great abundance.

Plants now ready, 3s. 6d. each.

NOTE.—Wm. Paul & Son were the original distributors of this and the two following varieties, and have still the largest stock of the best plants of them:—

MR. JOHN LAING, H.P.—Soft pink, large, and finely shaped, very sweet; free and good.

Plant now ready, 3s. 6d. each.

THE METEOR, H.P.—Deep velvety crimson, of medium size; exceedingly valuable for pot culture and winter-blooming.

Plants now ready, 3s. 6d. each.

The following Roses of recent introduction are also now ready:—

FLORENCE PAUL, H.P. (Wm. Paul & Son).—Scarlet-crimson shaded with rose, 2s. 6d.

CHARLES DICKENS, H.P. (Wm. Paul & Son).—Rose colour, hardy and profuse. A grand bedding Rose, 2s. 6d.

GLOIRE DE MARGOTTIN, H.P.—Dazzling red, 3s. 6d.

MADAME HOSTE, Tea-scented.—Pale yellow, deeper centres. First-class Certificate, Royal Horticultural Society, to Wm. Paul & Son, May 8, 1888, 3s.

THE BRIDE, Tea-scented.—White, very large and full; quite first-rate, 2s. each, 18s. per dozen.

HER MAJESTY, H.P.—Satin-rose, very large, 1s. 6d.

EARL OF DUFFERIN, H.P.—Velvety crimson, shaded with maroon, 3s. 6d.

SIR ROWLAND HILL, H.P.—Maroon, 7s. 6d.

WALTHAM CLIMBERS, No. 1, 2 and 3, 2s. each. Very valuable red, perpetual-flowering, climbing Roses.

The New French Roses of 1888, 3s. each, 30s. per dozen.

The New French Roses of 1887, 2s. each, 21s. per dozen.

All other New Roses at advertised prices.

Priced Descriptive Catalogue of New Roses Post-free on application.

PAULS' NURSERIES, WALTHAM CROSS.

SATURDAY, MAY 12, 1888.

GARDENING IN THE TIME OF ADDISON.

IN a century which Carlyle, with some amount of truth, designated an age of shams, we shall not expect to find, or, indeed, search for, much originality or naturalness displayed in the art of gardening. That artificialness which was so inherent a quality in the manners and times, could not fail to communicate its pernicious influences to the arrangement and laying out of gardens; and so, no matter what publication we take up on this subject, we meet with the inevitable mazes, the parterres, the fountains, and the classic statues, the trained shrubs, the symmetrical trees, the perfectly designed flower-beds, and all the rest of it. Gardening with our forefathers was first and foremost an art, but it was an art whose mission was not to "mend Nature," but rather to "improve" upon it. So far, indeed, from taking a pattern from Nature, the aim apparently was to dispute all her claims to recognition, and to controvert every item of her teachings. The "art" as then practised was, in fact, the baldest, stiffest, and stupidest that has obtained in all the many phases of the world's history. It synchronised with every form of extraneous falsity, and its evil influences are even now—when we pride ourselves so much upon our superior learning and our anxiety for everything natural—observable on all sides.

The dignified Joseph Addison may be regarded as the pioneer of reform in the laying-out of gardens. In the *Spectator* of June 25, 1712, we have a charming paper from his pen on the qualifications of Nature and Art, "to entertain the imagination." Some dozen years before this Addison had travelled on the Continent, and had evidently a keen perception for the beauties of Nature in countries other than his own, but even Mr. Addison had to admit a predilection for "the curious fretwork of rocks and grottos" in embellishing Nature. In making the proposition that "there is generally in Nature something more grand and august, than what we meet with in the curiosities of Art," the essayist was of opinion that when "we see this imitated in any measure,

it gives us a nobler and more exalted kind of pleasure than that we receive from the nicer and more accurate productions of Art." It is on this account that he argues to the effect that "our English gardens are not so entertaining to the fancy as those in France and Italy, where we see a large extent of ground covered over with an agreeable mixture of garden and forest, which represent everywhere an artificial rudeness much more charming than that neatness and elegance which we meet with in those of our own country." After advocating, as both profitable and pleasant, the practice of growing Willows in marshes, and of shading mountains with Oaks, Mr. Addison passes on to the then vague and little-known subject of Chinese gardens. "Writers," he goes on to say, "who have given us an account of that country laugh at the plantations of our Europeans, which are laid out by the rule and line; because, they say, any one may place trees in equal rows and uniform figures. They choose rather to show a genius in works of this nature, and therefore always conceal the art by which they direct themselves. They have a word, it seems, in their language by which they express the particular beauty of a plantation that thus strikes the imagination at first sight, without discovering what it is that has so agreeable an effect. Our British gardeners, on the contrary, instead of humouring Nature, love to deviate from it as much as possible. Our trees rise in cones, globes, and pyramids. We see the marks of the scissars [sic] upon every plant and bush. I do not know whether I am singular in my opinion, but, for own part, I would rather look upon a tree in all its luxuriance and diffusion of houghs and branches, than when it is thus cut and trimmed into a mathematical figure; and cannot but fancy that an orchard in flower looks infinitely more delightful than all the little labyrinths of the most finished parterre."

Although the *Spectator* for August 12, 1712, contained an incidental reference by Steele to a "fine garden," which occasioned "a reflection upon the advantages of education or moral culture," it was not until September 6 of the same year that appeared the second of the only two essays on gardening, which were published either in the *Spectator* or *Tatler*. Like the first one, this is also by Addison, and was called forth by some of Steele's "reflections" in the number for August 12. In this long but extremely interesting essay, Addison describes himself as one looked upon "as an humorist in gardening." "I have," he says, "several acres about my house which I call my garden, and which a skilful gardener would not know what to call. It is a confusion of kitchen and parterre, orchard and flower garden, which lie so mixt and interwoven with one another that if a foreigner who had seen nothing of our country should be convey'd into my garden at his first landing he would look upon it as a natural wilderness, and one of the uncultivated parts of our country. My flowers grow up in several parts of the garden in the greatest luxuriance and profusion."

Mr. Addison's taste was, it appears, a very catholic one, for he set no value upon the abstract quality of rarity. On the contrary, if he met with a flower which pleased him in one of his country walks he did not hesitate to transfer it to his garden. The kitchen portion of his grounds was to him a very pleasant sight—finer, indeed, than the finest orangery or artificial greenhouse. "I love to see everything in its perfection, and am more pleased to survey my rows of Coleworts and Cabbages, with a thousand nameless pot-herbs springing up in

their full fragraney and verdure, than to see the tender plants of foreign countries kept alive by artificial heats, or withering in an air and soil that are not adapted to them." He was considered "very whimsical" by his neighbours from the fact that "as my garden invites into it all the birds of the country by offering them the conveniency of springs and shades, solitude and shelter, I do not suffer anyone to destroy their nests in the spring, or to drive them from their usual haunts in fruit time. I value my garden more for being full of blackbirds than Cherries, and very frankly give them fruit for their songs." We do not at all wonder at a man with such broad—even Utopian—ideas being considered whimsical. This same essay deals with two other matters to which we cannot do more than allude. The one is the contention that there are as many kinds of gardening as of poetry (his own compositions on the former being "after the Pindarick manner"), and the other a strong advocacy of winter gardens.

Rather more than twelve months after the *Spectator's* last essay on gardening, the *Guardian* (September 29, 1713) contained an interesting paper on the same topic from the pen of Pope, who, being as he was, the most artificial of men, would be about the last from whom to expect anything in the way of desire for naturalness. He feared that a "particular friend," whom he had invited to his house in the country, would find little entertainment either in the architecture or the gardening of the place. The man of "polite taste," however, was not only delighted with the country garden, but quoted five lines from Martial's *Epigrams* (lviii., 3), which are thus translated or paraphrased:—

"Our friend Faustinus' country-seat I've seen:
No Myrtles, plac'd in rows, and idly green;
No widow'd Platane, nor clip'd Box tree there
The useless soil unprofitably share;
But simple Nature's hand, with nobler grace,
Diffuses artless beauties o'er the place."

Pope translates, for the first time, Homer's famous account of the "Garden of Alcinous," from the seventh book of the *Odyssey*. How contrary (exclaims the essayist) to "simplicity is the modern practice of gardening! We seem to make it our study to recede from Nature, not only in the various tinsure of greens into the most regular and formal shapes, but even in monstrous attempts beyond the reach of the art itself. We run into sculpture, and are yet better pleased to have our trees in the most awkward figures of men and animals, than in the most regular of their own."

Pope, however, was an admitted authority on matters relating to gardening; for Walpole (writing in 1770) was of opinion that "the design of the Prince of Wales' garden at Carlton House was evidently borrowed from the poet's at Twickenham. There was a little of affected modesty in the latter, when he said of all his works he was most proud of his garden."

A very remarkable activity developed itself in the production of books on gardening during the first and second quarters of the eighteenth century. The distinction then between the gardener who compiled books, the botanist, and the herbalist, was a very small one indeed. Philip Miller is a case in point; and Bradley was another, with, of course, a decidedly philosophical tinge to his writings.

The influence of the two *Spectator* articles must have been much greater than is generally thought. Addison's charming manner of depicting the picturesque no doubt caused a large number of our grandfathers—when newspapers

were few, and means of intercommunication very limited—to turn their attention to gardening, and so kill some of the time which hung heavily with them. This inference is drawn from the fact that nearly every fairly good gardening book ran through edition after edition. The comparative cessation from home and foreign difficulties no doubt contributed to this highly satisfactory condition of things. The names of the eighteenth century gardening books are legion, but things were far different in that which preceded, and the number of really good books which appeared during the earlier period was very insignificant, and the intervals long. Gervase Markham's *English Husbandman* (1613) was followed in 1629 by John Parkinson's *Garden of all Sorts of Pleasant Flowers*, and in 1640 by the same author's *Theatre of Plants*. Evelyn's horticultural compilations and translations were the most important publications of the third half of the century, and the most popular work of the last years was the translation entitled *The Complete Gardener*, from M. de la Quintinye, "chief director of all the gardens of the French king." This appeared in folio in 1693, and six years later an abridgement came out under the auspices of George London and Henry Wise, both of whom were well-known to Addison and also to Evelyn. They are referred to at least twice in the *Spectator*. In the fifth number (March 6, 1711), we read, "I hear there is a treaty on foot with London and Wise (who will be appointed gardeners of the playhouse) to furnish the opera *Rinaldo and Armida* with an Orange grove;" and in the issue for September 6, 1712, they are termed the "heroick poets" of gardening. Evelyn describes their nursery as far surpassing all the others in England put together, extending as it did, to over a hundred acres.

It will be seen, therefore, from what we have stated, that Joseph Addison has strong claims upon our attention, not only because he contributed greatly to the popularisation of gardening, but because he was almost the very first in England to advocate a more natural system of laying out grounds. The hints which he might have gathered from the books that appeared before his essay would not have assisted him much, and so there is scarcely any debating the fact that the principles which he sought to enforce were the outcome of his own observations in England and other countries.

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM CHLOROPS, *hyb. artif., Vindob., N. Rothschild.*

This should be called *Selenipedium chlorops*, were it not for the convenience of amateurs. It was raised at the Hohenwart, Heiligenstadt, near Vienna, in the garden of Baron Nathaniel Rothschild, by his most ardent and industrious Orchid-grower, Mr. Ferdinand Horn.

One of the parents was, I believe, *Cypripedium Hartwegii* (I saw very little), the other parent is unknown. As we have the prospect before us of getting thousands of hybrid varieties of Orchids, and hundreds of such varieties of *Cypripedia*, it is high time to protest against plants of unknown parentage—it is so very easy to avoid this result. Take double signatures (have a two-fold record), and keep a book. Put one number on the label, and have the same number painted at a certain constant place on the pot or basket, and enter the number with notes in your book, and you will be certain to keep order. It would be best to keep a copy of the book. I know of a case where one of

the most intelligent amateurs (a gentleman who has a scientific library) lost his book when he ceased to grow Orchids.

The plant has the rather narrow leaves of *Cypripedium Pearcei*, but somewhat broader. The long peduncle reaches 1½ foot, and bears seven, perhaps more, flowers, two of which expand at once. It is purple, green and marbled at the very base. There

of the mouth are blunt, semi-oblong. The broad involved margin leaves no opening into the pouch (as it appears *C. Hartwegii* does constantly), both margins being quite contiguous. It is one white mass, adorned with innumerable spots and minute dots. There is one transverse row of dark brown spots, mixed with light green spots, while around are scattered innumerable small light purple ones. The staminode is

CROSSING OF FERNS.

I HAVE been much interested in the article by Colonel A. M. Jones on the "Crossing of Ferns," which recently appeared on pp. 426, and 457—459 of the *Gardeners' Chronicle*. The important revelations therein on the crossing of species at once suggested a probable explanation of a circumstance to me

JOHN CHALMERS MORTON. (SEE P. 592.)

are scattered short hairs on it. The bracts are sheathing, acuminate, shorter than the dark purple glabrous ovaries. Upper sepal narrow, triangular, shining undulate at the margin, with dark green nerves. Inferior sepal broader, a little shorter than, or nearly equal to, the lip, with red nerves outside. Petals broader, at the base, extended into a long brown nearly glabrous tail about twice the length of the lip. The lip is unusually broad, thus reminding one of the lip of *C. Hartwegii*. The pouch is rather short and retuse. The side angles at either side

rhombic, acute in the middle in front, emarginate on the inner edge, anterior sides glabrous, upper ones covered with blackish-purple hairs. It is quite like *C. Pearcei*, having a light green surface, sometimes flushed with brown. *H. G. Rehb. f.*

THE LAWNS AT THE ITALIAN EXHIBITION.—The lawns at this Exhibition have, we are informed, been laid down with grass seeds supplied by Messrs. J. CARTER & Co., Holborn.

otherwise inexplicable in my own Fern-collecting experience in Jamaica. I refer to a remarkable group of closely allied Ferns which I found while collecting in the interests of the Botanical Department of the island. I discovered the plants growing, under highly favourable conditions, at the base of an artificially built dry-stone wall on a hill of the coral limestone. In this position they covered an oblong space little more than two yards long, and their fronds were not only crowded but, owing to the shape and habit of many, were much warped together.

A goodly number of fronds were detached and placed in drying paper for herbarium purposes, and most if not all of the plants from which they were detached were lifted, carried to the Botanic Garden, and potted for further development and botanical determination. When the latter had become established in the pots and in a freely fertile condition, I used to take pleasure in arranging the set, so as to show, to interested friends and visitors, the almost if not quite complete chain of varietal links leading to the extremes, which latter were supposed to be or represent *Polypodium reptans*, Swartz; *P. r. var. gracilis*, Fée; *P. asplenoides*, Swartz; *P. a. var. tenera*, Fée; and *Nephrodium scolopendrioides*, Hook.; and possibly others.

A set of specimens of the collection were deposited in the herbarium of the department, and were provisionally numbered under *Polypodium reptans* and *Nephrodium scolopendrioides* until they could be determined by experts. There were seven varieties under the former and nine under the latter name, but I always looked upon them as very imperfectly representing the features of the plants as I originally found them. A detached and desiccated frond, however perfect, very inadequately represents the natural history of a species, or even the individual plant of which it once formed a part.

I had previously and elsewhere found the types of the above-mentioned species, but never before associated—closely associated; and their connecting varieties—probably hybrids—were all new to me.

But some readers may not unnaturally ask, How is it possible, as suggested, for the species of *Nephrodium* and *Polypodium* to be linked together by varieties?

Perfectly possible, when we remember that these are only book names. Not unfrequently have I found in Nature *Polypodia*, where systematic books led me to expect *Nephrodia*. Nature is less exact in the matter of indusia than are our treatises on the genera of Ferns; she is less systematic, and, as a matter of course, always more natural than they. This, by the way. I herewith forward small and not quite mature specimens of *Polypodium reptans*, Swartz, and *P. asplenoides*, Swartz (also of the *Synopsis Filicum*), collected by me in Jamaica, to prove that both are species of *Nephrodium*, as generically defined in the *Synopsis Filicum*. And as *scolopendrioides* is correctly referred to *Nephrodium* in the said work, we have the way cleared for a possible, and, as I think, a very close affinity between all three.

One notable feature of the group of plants in question was that the individuals were more or less proliferous. This was generally so only on the barren and semi-barren fronds, as in the case of the well known reptans, but in other plants on all the fronds; and when buds were developed at distant intervals on the much elongated rachis, the frond was bent and undulated somewhat in the way represented in the pressed, yet elegant, frond herewith forwarded and labelled *Nephrodium scolopendrioides* var.

This is really one of the most graceful Ferns known to me, and one which, were it imported, would prove to the horticultural world an acquisition of great value for pot and basket culture. It is one of the remarkable group of supposed-to-be hybrids herein referred to. I take this opportunity of thanking Mr. Jones for having unwittingly suggested to me a possible explanation of its creation. *Geo. Syme*.

[The specimens sent were referred to Mr. Baker, who says, "They represent both species I see in the herbarium of Jamaica plants introduced by my colleague, Mr. Morris. *Nephrodium scolopendrioides* is so variable, that eight numbers (J. P., 359 to 366) are devoted to it. Mr. Syme should read what Colonel Beddome has said about the casual occurrence of an indusium in many species allied to *P. reptans* in his recently published *Ferns of British India*. The *Desmobraoid Polypodia*, treated by Fée and Mettenius as a genus under the name of *Phegopteris*, are separated from the *Aspidieae* solely by the artificial character of the absence of an indusium. I place *asplenoides* as a

variety of reptans, and look on the plants dealt with by Mr. Syme as two very variable species. He has demonstrated the casual existence of an indusium in *P. reptans*, but I do not think he has run reptans into *scolopendrioides*." *Ed.*]

APPLE CULTURE IN CORNWALL.

I was pleased to see so able a correspondent as "A. D." introducing the subject of Apple culture. I have often thought it might be made both a profitable and interesting business, more especially now, in these times of agricultural depression, when the question of the day is, What shall be done to make the land produce a better return? Probably there are other kinds of fruit that would give a quicker return than Apples. I shall be pleased to see those that have made a profit of such publish their experience in these columns. I have had the management of orchards for more than twenty years, and I am pleased to give the readers of the *Gardeners' Chronicle* the benefit of my experience. I have proved that such kinds as Red Astrachan, King of the Pippins, Wellington Pippin, Starmer Pippin, and Tower of Glamis do well in orchards, and will pay to grow, with proper attention; but if planted in old orchards they require the soil to be well broken up to at least a distance of 8 feet, and a cartload of good rich soil worked round them, with periodical dressings of soil from the rubbish-heap—well rotted—once in three years; this I prefer to rank manure. My trees, treated in this way, give greater satisfaction than those in the garden; they are free from canker, they make no superfluous growth, consequently they give better crops, and the fruit keeps longer.

I do not recommend the practice of exterminating all local varieties, for they are usually very hardy, and many kinds command a ready sale; but, as "A. D." said of our nurserymen, we are also teeming with useless varieties. To grow solely for cider-making does not pay in this county, owing to the advance of the temperance cause, and a preference for beer; and, moreover, some farmers, who are total abstainers, are neglecting their Orchards, in fact many bushels of Apples were sadly wasted last summer, being given to pigs and bullocks, and even trodden under foot. All thinking men rejoice to see drunkenness diminished, but to neglect an industry is absurd, for I am informed that it will pay to make cider if you have the suitable fruit.

Last season good dessert Apples made from 8s. to 12s. per bushel of 56 lb., tart kinds at half those prices (wholesale) and for several months the demand exceeded the supply. "A. D." mentions the county of Cornwall, but I, who have had experience in other counties, find the soil here of a poor nature, even where it is deep and requiring much top-dressing; we could not, therefore compete with Kent, Worcester, or Devon. "A. D." recommends vegetables to be grown between the trees while young, and it is found that by having a piggy near the orchard a good return can be made with little labour. Some of the orchards are white with Snowdrops in February others are yellow with Lenten Lilies. These can be marketed. I quite agree with "A. D." that to select slopes and valleys as sites for orchards is the proper thing, and that exposed situations must be avoided.

A great encouragement to the cause of orchard culture in the leading article of this paper for April 28, which contained an excellent report of the acreage under orchards, which was in 1887, 202,234, as against 148,221 in 1867. Imports are equivalent to the produce of about 25,000 acres, and on the average of seven years the crop in Kent is 130 bushels, or about £34 to the acre. I should here have to be content with nearly £10 less, but of course this is taking orchards in a general way, and where such fruit is grown that we cannot grow. The telling conclusion to this report was, that the value of imports is put at £857,095, and this large sum might be secured by the home growers. I have not answered the question, "Does it pay to plant Apple trees extensively?" for that requires the

experience of practical men in various localities, and I hope to have the pleasure of reading such in these columns. At some future time I should be pleased to give further details, such as a list of local sorts, many of them having quaint names. I send a few samples, just to show that I have kept orchard fruit until May 4. *C. L., Bocomoc*. [The fruits were of fair size, good in colour, but of course much past their best. *Ed.*]

TREES AND SHRUBS.

ABIES SUBALPINA.

In the South of Perthshire I saw, lately, a plant of *Abies* (*Picea*) *bifolia*, Murray, which was raised from seed collected by Roelz somewhere in North America in the autumn of 1874.

It is rather unfortunate that, so far as I am aware, it is not on record where, in America, Roelz found his seeds and specimens of this Fir; because, for one reason, his cone-bearing branch, originally figured in the *Gardeners' Chronicle*, 1875, p. 465, f. 96, 97, and since in the Linnean Society's *Journal of Botany*, vol. xxii., p. 183, f. 12, differs considerably from a cone-bearing branch of *Abies subalpina*, Engelman—said to be specifically identical with *A. (P.) bifolia*—figured in the same journal as No. 16, p. 186.

The leaves of the former are longer, thinner, narrower, and scarcely pointed. Notwithstanding this, these dissimilar fertile branches may have been cut from the same tree; and, if so, I should presume that the one with broad sharply-pointed leaves grew near the top, the other at a point above middle height of the tree. Or Roelz's specimen may have been cut from a comparatively young tree; or it may represent a distinct geographical variety of *A. subalpina*. I am not aware that the typical *subalpina* is in cultivation in Britain [Yes, in the form of young plants], but I am quite certain that Roelz's plant is; and I regret to say that, having been on trial these thirteen years, it cannot now be ranked among the better class ornamental Firs. It is too slow for anything. The plant I lately saw in Scotland measured only 2½ feet high, by about 3 feet in spread of branches. The latter were very dense, yet without visible evidence of ever having been cut by frost. Its roots grew in rich black loam, and have not been disturbed these ten years. The stem seemed prepared at last to make a start upward, as you may judge by the appearance of the strong adventitious shoot herewith, which I cut from the tree with a view to strengthen the proper leader in its aspirations. It might have been encouraged upward sooner had its disproportionate lower branches been timely pruned, foreshortened or thinned-out, or both. And the same treatment, or a more natural modification of it, might be beneficially applied to most of the Firs, Spruces—including Douglas "Spruce," (*Pseudo-Tsuga*)—and Pines of the Central Rocky Mountain region, as well as some others, notably Spruces natives of Japan, and the graceful *P. orientalis* of the Caucasus. They should, as nurslings, be splayed as to throw the duty of nursing and pruning one another on Nature, and what she may thus fail to effect the pruning-knife and high general culture should complete. They should, indeed, be treated as ordinary forest trees are—planted in close rows, so as to develop rapidly clean free-growing stems. [There is certainly a slight difference in appearance between specimens of *A. subalpina* and *A. bifolia*, as sent by our correspondent, but not greater than might readily occur on the same tree; moreover, we find on microscopical examination of the leaves that the leaf-structure is identical. *Ed.*]

PICEA PUNGENS, ENGBELMAN.

An example of this, growing close by the *Abies* above referred to, and, like it, raised from seed collected by Roelz, was 5 feet 9 inches in height, and about 2½ feet in diameter of lower branches. It was therefore decidedly narrow, conical, and, in effect, formal, skeleton-like, not for lack of foliage, but

because of its spare arm-and-rib-like branches, which issued from the stem at painfully regular intervals of from 6 to 8 inches in the direction of the horizon, or but slightly declining. It was, indeed, distinct—I may say unique—in habit, which, together with its bold, assurgent, pungent, hoary, blue-green foliage, stamped it as peculiarly effective.

I am now truly glad that Dr. Engelmann had the bold assurance, in the face of much that was favourable to the union, to separate this from *P. sitchensis*, and raise it, so to speak, to the specific peerage; for though these extreme forms are all but linked together by geographical varieties, it was necessary to draw the line somewhere, more especially when the crank factors of systematic botany bad to be considered. *G. Syme.*

NOTES FROM BELGIAN NURSERIES.

(Continued from p. 551.)

LOUIS VAN HOUTTE.—As there are nearer 300 than 200 nursery establishments in the immediate vicinity of Ghent, it is obviously impossible to do justice to them individually. The "Vans" and the "Vers" and the "De's" have, moreover, a very strong family resemblance, so that the task of the reporter is rendered difficult, not only from the similarity of the products grown in each establishment, but also from the frequent identity in the proprietor's patronymic, so that the reporter becomes confused, and at length wonders which of the Van Somebodies—Adolf, Eugène, Jean—he is visiting. There is, however, one establishment, and there is one name, which stands out among the rest, and not the most sensitive Gantois will raise objection to the homage paid to the memory of Louis van Houtte. Former visitors to this vast establishment will be interested to know that in all save one department the nursery is carried on as before. Even the Victoria-house, which one would hardly expect to find in a commercial establishment, and which had been wrecked by a storm, has been rebuilt, its crown-like form suggestive of the kingly position of its original founder. The exception is, that the printing and lithographic departments where the *Flore des Serres* was elaborated have been closed. The management of a large and diversified nursery business is nite enough to tax the energies of the managers without this somewhat extraneous department.

We should be inclined to say that the general upkeep of the establishment is better than ever. We have no intention of writing a report of this nursery; it is much too extensive and too diverse to allow of that being done; suffice it to say that, while the Ghent specialties—the Bays, the Camellias, the Azaleas, the Rhododendrons, Palms, Cycads, Cliveas—are thoroughly well done, and in prodigious quantities, Orchids are well represented; while no one would think, from what he sees here, that New Holland plants had gone out of fashion.

What casual visitor could have thought on visiting this nursery that many of the grandest groups in the show at the Casino were furnished by this establishment? There was no appearance of depletion at home. Whether the visitor was requested to "come and see" at the nursery, or to "go and see" at the Casino, the result was the same—admiration at the abundance, variety, and excellence of the exhibits made by M. Louis van Houtte.

Out-of-doors the hardy trees and shrubs and herbaceous plants, for which the nursery is famous, did not make much show, owing to the lateness of the season, though Hyacinths and Narcissus might be seen gleaming in the distance. With a large instalment of the 200 and odd nurseries to visit, with four invitations to dinner, let alone lunches and incidentals, we felt that the line must be drawn somewhere, and we contented ourselves with a mere glance over the flat acres of leafless nursery ground, and bestowing a passing look at the noble specimens

of Kämpfer's Larch, the relatively gigantic *Retinospora pisifera*, the fine *Sciadopitys verticillata*, the *Tsuga Hookeriana*, and other fine specimens of Conifers, we rushed away with the consciousness that this nursery well maintains its ancient reputation and needs no commendation from us.

EO. PYNÆRT-VAN GEERT.

M. Pynaert, whose establishment forms the advance guard of the numerous colony at Gendbrugge and Ledeberg, and which overlooks the sluggish Sebeldt, is evidently determined that the fame of Van Geert shall not suffer in his hands. His house is square and substantial. Is the visitor English?—he will find on one side "Exotic Nursery;" is he German?—the inscription *Handelsgärtner* will attract him; is he French?—M. Pynaert has a side for him; while he is far too patriotic a man not to have one side of his house duly inscribed in Flemish. No doubt, were there more sides to be inscribed Russian and Italian would find their place, as they do at the proprietor's hospitable table! Ghent specialties are here as a matter of course, it would not be a Ghent nursery without them, but M. Pynaert has wider aims, and, in addition to the Ghent inevitables, there is here a large and varied general nursery stock extended in particular since our last visit by a rich collection of Orchids, including a fine collection of *Cypripediums*, as a matter of course. The Orchids are a heritage from M. van Geert, but much extended. The rapid and substantial growth which some of these Orchids were making testified to the suitability of the conditions and to the care bestowed upon them. For *Masdevallias*, *Odontoglossums*, and other cool Orchids, a cool house with a north-west aspect, with air on night and day, is found very suitable. *Chrysanthemums* also are undertaken in this establishment—an innovation, so far as Belgian nurseries go, and we should not wonder that those whose good fortune it may be to be present at another Quinquennial will find the nurseries as full of *Chrysanthemums* as they now are of *Cliveas* and *Azaleas*. An autumn Quinquennial will then become a necessity. Palms, *Aspidistras*, *Phormiums*, *Cliveas*, *Azaleas* are, of course, in profusion. Less common is a beautiful collection of *Bertolonias* and *Sonerilas*, and a fine set of the very handsome gold-striped *Dracena Lindenii*. Ferns are largely grown here, more largely than in most of the Ghent nurseries. Another class of plants altogether is represented by the *Epiphyllums*—nice little plants grafted as standards—and whose surprisingly brilliant yet soft tinted flowers make it a subject of astonishment that they should have gone out of favour on this side of the Channel. Of the "new plants" cultivated by M. Pynaert we have already spoken on various occasions. It is a comfort to find still some nurserymen exhibiting "new plants." The stock of new plants to be introduced is by no means exhausted yet, and while we have nothing but admiration for the skill and care which have produced all the acres of *Azaleas* and the like, one sees at Ghent and elsewhere, it must be admitted that there is a risk of a surfeit from which the occasional introduction of new plants may save us, to say nothing of the botanical interest of new introductions. By the way, if M. Pynaert should happen to peruse these lines, we may ask him about the "inimitable" *Aristolochia*, which finds a place in our note-book as copied from a tally in his nursery. What *Aristolochia inimitabilis* may be we should be glad to know. Of Conifers, Rhododendrons, and hardy trees and shrubs M. Pynaert has a large collection; indeed, we may say that, even as his house is not one-sided but offers a friendly face in more than one direction, so in his nursery there is more than a little of everything and most of it of excellent quality.

EUGENE VERVAET DE VOS.

The establishment at Swynaerde is a vast plant manufactory, in which the glass covers an area of 2600 metres, and wherein thousands upon thousands of *Azalea indica*, together with the Japanese *A. mollis* and the hardy Ghent *Azaleas* (hybrids between the North American and the Pontic species, are grown. The Indian *Azaleas* are all here grafted on

low stems of equal height, about 4 inches, and form heads a foot or 18 inches across. The "stock" is some free growing seedling of the same species. Of such market plants there are at least 50,000. Our own growers are well aware of the resources of this establishment, as we are assured that more than 40,000 Indian *Azaleas* were supplied to English nurserymen alone last year. For the formation of those little compact bushes of uniform height, M. E. Vervæet has long been famous. It is well known that most of the new *Azaleas* are merely "sports," but the possibility of occasional graft-hybridisation must not be overlooked. *Camellias* exhibit no sign of decline here, and *Rhododendrons* and Pontic *Azaleas* are grown by thousands.

To be continued.)

NARCISSUS TRIANDRUS AND N. CALATHINUS.

A YEAR or two ago I did my best to trace the error which caused De Candolle to give to a variety of *N. triandrus* the name of *N. calathinus*, which had been adopted by Linnæus for a large-crowned form of *N. odorus* described by Clusius and Parkinson. At that time I had not grown specimens enough of the *N. calathinus* as figured by Redouté to know how far it was distinct from the *N. triandrus* which is so abundant in the north-west of the Spanish peninsula. This latter plant has recently been imported abundantly from Oporto, and is a very variable plant both in size and form, and in other particulars. It was named *N. reflexus* by the Portuguese botanist Brotero nearly a century ago. At different times in the last four years Mr. Tait, of Oporto, has sent me a large number of bulbs collected whilst in flower from different stations in the North of Portugal, selections being made of any variation in size or colour. I have also had some bulbs sent me which were collected in Asturias; these were called *N. calathinus*, and some dealers continue to sell large bulbs of this form of *triandrus* under the name of *calathinus*; but I am convinced that both the forms as they exist in the Spanish peninsula belong to *N. reflexus* of Brotero, and though the extremes vary greatly in size, no line of separation can be drawn between them. But the *N. calathinus* of Redouté is a very distinct variety from the Spanish plant. The whole flower is larger, the crown much wider and longer in proportion to the rest of the flower, and the colour is of a much purer white; the leaves are more procumbent, and thicker for their size. The only locality where it is known to be found wild is the island of Dréneç, off the south-west coast of Brittany, and any fresh flower from this island may at a glance be distinguished from any Portuguese flower by these characters. In dried specimens these distinctions are far less conspicuous. The variety *N. calathinus* is far more difficult to cultivate than *N. reflexus*; it is less hardy, as it dies in my garden even under a south wall, where the Portuguese *triandrus* thrives well, not having suffered during the past winter, though the leaves were 2 or 3 inches above ground in November. I believe that the Dréneç bulbs require a little salt in the soil. Mr. Elwes tells me he can only grow them in sea sand.

Besides the two varieties of *N. triandrus* mentioned above, I have three others in cultivation; one is the *N. pallidus* of Graells, collected by Mr. G. Maw in Central Spain. It is a small, weak-growing plant, with a single leaf, and a slender flower of pale straw colour. It is described and figured by Willkomm by the name of *N. cernuus* (Salisbury). The figure is evidently from a dried specimen, and the colour is too deep.

Another variety, recently described by Don Henriquez, of Coimbra, as *N. concolor*, is certainly distinct from *N. concolor* of the *Botanical Magazine*. Only a few specimens of it have been found on the Sierra d'Estrelle in Central Portugal. It is a delicate and dwarf plant, with a short, nearly globular flower of uniform deep yellow; it has a strong and characteristic scent, exactly like the flower of *N. junceifolius*, which has led me to think it may perhaps

be a hybrid of that species; it is very distinct in appearance from any other triandrus.

Another variety is not uncommon in England in cultivation, and is known as *N. triandrus pulchellus*; it has a primrose-coloured perianth, and a pale straw-coloured crown, and is the only *Narcissus* I have ever seen which has the crown paler than the perianth. I have often raised it from seed, and the flowers come perfectly true, having all the parts and organs constant, and not variable as they are in the varieties *reflexus* and *calathinus*. I have never been able to find its native province, but I suspect it is the variety of *triandrus* described by Asso as common in Arragon; but though I have received several varieties of *Daffodils* from Arragon, I have not yet got this. Like *N. reflexus*, I find it hardy in Cheshire under a south wall.

In view of the confusion of names which is found amongst the varieties of this species, would it not be better to retain the name *triandrus*, which Linnaeus invented, for the species, adding *calathinus*, *pallidulus*, *pulchellus*, &c., as varietal names, especially as the *N. calathinus* of the *Botanical Magazine* is a variety of *N. odoratus*, and this name is still retained in some catalogues on the authority of that work? *C. Wolley Dod.*

FREESIAS.

PROFESSOR MACOWAN'S note on *Freessias*, in the *Gardeners' Chronicle*, of April 21, p. 492, leads me to send you the following memorandum, which I drew up some four years ago.

I can recognise among *Freessias* the following three types:—

a. Leaves narrow (3–5 lines), rigid, ribbed, mid-rib prominent, dark green, purplish at base, arranged in a dense distichous tuft.

Scape much branched, many-flowered, ten or more flowers on a spike from even small bulbs.

Spathe-valves acute scarious, often so divergent as to expose the yet immature ovary.

Flowers small, greenish-yellow, with purple lines; perianth segments so arranged as to form a two-lipped limb, the upper lip consisting of a broadish segment, with two lateral wing-like segments forming a hood over the stigma and anthers, the lower lip of a narrow median segment, overlapped by two lateral ones, the sides of which are raised into two ridges. Tube abruptly constricted above spathe valves.

Tritonia refracta, *Bot. Reg.*, t. 135, corresponds in every way exactly to this. The describer and draughtsman evidently had this very plant under their eyes.

Gladiolus refractus, *Red., Lil.*, t. 419, is virtually the same, though the spathe-valves are not so pointed and narrow, leaves not quite so narrow, flower not so irregular.

Tritonia refracta, *Jacquin*, t. 241, seems also to be the same, but the drawing is very inferior, and difficult to judge by.

The narrow, rigid, ribbed dark green leaves, the branching, many, but small-flowered scape, correlated with scarious pointed spathe-valves and irregular two-lipped flower, seems to me to justify its being made a type; the name should be *Freessia refracta*.

I had this plant from Mr. C. Smith, of Guernsey, and have since received from Mr. Rawson as *F. aurea* a plant almost exactly like the above, except that the flowers were of a bright rich yellow and the spathe-valves not so scarious.

b. Leaves broad, from 5 lines to 1 inch, pale green, rather flaccid, not very ribbed, few leaves only in tuft, and soon spreading, so as to diminish the distichous character.

Scape with one terminal and rarely more than two lateral spikes of usually seven flowers, needing generous treatment to produce more, spathe-valves persistent, shield-like, toothed.

Flowers white, very nearly regular, requiring care to see that some of the segments are smaller than others. Segments often reflexed, so as to turn back horizontally from mouth of tube.

Tube diminishing regularly, as an elongated cone, from the top to spathe valves, without any sudden constriction.

This is the *Freessia refracta alba* of the trade; it does not wholly correspond to *Gladiolus xanthospilus* of *Redouté's Liliaceae*, or to any other figure or description of older writers. It seems to me a distinct type, which I should propose to call *F. alba*.

c. Foliage like above, but less luxuriant. Spathe-valves and scape like the above.

These seem to me to be the three types, a and n being the two extremes, and c being intermediate.

I have not yet met with the character of n belonging to other than pure white flowers, with, however, purple lines or orange blotches more or less conspicuous. It is the largest, finest, and most vigorous.

FIG. 79.—FREESSIA LEICHTLINIANA: LIGHT YELLOW. (SEE P. 588.)

Flower smaller, less regular, almost two-lipped (deep yellow colour in type), with tube suddenly constricted above spathe-valves.

This corresponds exactly to the *Tritonia odorata*. *Lodd., Bot. Cab.*, 1820—seems to me a type—and should be called *F. odorata*. The flowers may be deep yellow, or dirty yellow, with purple stripes and blotches, or white, with more or less purple blotches and stripes.

Gladiolus xanthospilus of *Red., Lil.*, has the constricted tube of c, and therefore though not exactly *F. alba*, is nearer to it than to anything else.

While maintaining these three types I am prepared to admit intermediate forms between all of them. Thus I have had from Smith, of Guernsey, a form like a in foliage, growth, &c. (but with persistent green spathe-valves and less irregular flower); and I have a form from the Cape in general habit

like c, but with flowers very two-lipped, like a, and heavily splashed with violet.

But all these and other varieties can be arranged around and between the above three forms, and the names I have suggested for two of the forms are old names, and the third name is simple.

I have seen nothing since writing the above which has led me to change my mind, but I may add the following:—

Freesia Leichtlini (I have plants from offsets of the original plant described by Klatt; these were kindly given me by my friend Mr. Max Leichtlin) is intermediate between b and c; it has the constricted tube of the latter, but the more regular flowers of the former; the mouth is remarkably wide and open, the colour is a uniform light yellow, the foliage is broad. (Fig. 79.)

Each form has a distinct odour; that of c is

THE CLIMATE OF MANIPUR.

At a recent meeting of the Royal Geographical Society, Dr. G. Watt made some valuable remarks on his observations in the Manipur district. Manipur is a small valley surrounded by mountain ranges, and in this valley the rainfall was found to be only about 39 inches, but 17 miles off, in the mountains which formed the north-east ranges, the rainfall was as much as 120 inches, and towards the Naga country to the north it became greater and greater in certain limited tracts. In the Khasia Hills 600 inches might fall in one place, and 20 miles off only 50 inches.

Nothing in Manipur struck Dr. Watt so much, as a botanist, as the remarkable transitions of vegetation in that small region. Dr. Watt gathered twelve or more species of Oaks, many of which were

Manipur compared with Assam were connected with the evident lowering of temperature indicated by the low snow-line. There could be no doubt that the warm currents of air coming up the valleys of the Irrawadi and the Salween, and meeting the snowy mountains to the north, produced an enormous precipitation of rain, which during winter fell as snow. The consequence seemed to be that there was snow there at a very much lower level than in the mountains further to the north. That an immense quantity of rain fell in the upper portions of the valley of the Irrawadi there could be no question. Such a rainfall seemed in itself quite sufficient to account for the large volume of water that was drained off by the lower portions of the Irrawadi; and anybody who knew what Tibet was, General Strachey stated, must be aware that, even with a course of several hundred miles, the river would pick up but a small quantity of water in comparison with the enormous volumes which were collected from the rain which

FIG. 80.—THE FIRST EXHIBITION OF THE ROYAL SOCIETY OF BOTANY AND AGRICULTURE AT GHENT, FEBRUARY 7—10, 1809.

quite different from n, and that of a is remarkably peculiar, having a marked dash of Lemon.

Crosses (? hybrids) between any two of the forms, show characters of both parents; but the "blood" of b seems to me to be especially potent. Seedlings in which n is a parent turn out in many cases to be nearly pure n. So that whatever the origin of b, it has got itself well established as a distinct form. On the other hand a asserts its individuality by not breeding so regularly with n or c, as these do with each other. When crossed it does not go to seed so readily, and the seeds do not germinate readily.

Some forms of c have a distinct red blush, and I am gradually obtaining, by repeated seeding, a quite deeply coloured form.

Any one putting a and n side by side would naturally call them distinct species; and the only reason for not considering them such is the existence of a long series of intermediate forms. M. Foster,

new to science, and ten or twelve species of Rhododendrons in Manipur alone. The Rhododendron Falconeri, found in the Naga Hills by Sir Joseph Hooker, is now here met with in the immense tract between the Naga Hills and Sikkim. This and the epiphytic R. Dalhousie, which grows on a hill 30 miles north of Darjeeling. Dr. Watt found in the Naga Hills at an altitude of 6000 to 8000 feet, and these Rhododendrons never occur in Sikkim below 10,000 to 13,000 feet. There were many instances of plants falling in their altitude as the traveller passed to the east and south-east from Sikkim, until at Moulmein a Rhododendron was found growing near the sea, a circumstance which was not met with in any other part of Asia. In Manipur the whole valley, 3000 feet high, was covered with hoar-frost in December.

General Strachey, who was in the chair, considered that the peculiarities of the vegetation of

fell in Upper Burma. General Strachey had roughly calculated that a monthly fall of rain of 18 inches over a square degree would mean 65,000 cubic feet per second for the whole month. Nature.

THE FIRST GHENT SHOW.

In a previous issue (p. 496) we alluded to the reproduction of the building in which was held the first show of the Royal Society of Botany and Agriculture of Ghent as being one of the most interesting features of the recent Exhibition, and at the same time we gave a list of plants shown on that occasion. We are now enabled (by the courtesy of the Editors of the *Revue de l'Horticulture Belge*) to place before our readers an illustration (fig. 80) of the show of 1809, on which occasion only one prize was awarded. In this year's schedule there were over 100 classes.

LAW NOTES.

THE VALIDITY OF NON-GUARANTIE CLAUSES.

In a previous number we reported the result of the action, *Reynolds v. Wrench*, tried before Mr. Justice Denman. The case came before the Divisional Court, consisting of Mr. Baron Pollock and Mr. Justice Charles, on the 18th ult., by way of application on the part of Messrs. Wrench for a new trial.

Mr. Baron Pollock, in delivering judgment, said:—The arguments in this case have been of a very interesting and instructive nature. The case before Mr. Justice Denman was clear. Mrs. Reynolds, the plaintiff, received from Messrs. Wrench, the defendants, a certain quantity of Turnip seed, viz., Yellow Tankard Turnip, which was particularly suitable for old growth. When the plaintiff returned the produce we now know that it consisted of Purple Mammoth Turnip seed which was of an early growth, and it could not be distinguished by view or touch, the result could only be known after it had been grown. Wrench sold the seed to a firm in Edinburgh, who sold it to customers to be grown in Germany. It was of great importance that it should be not of an early but of a late growth. Hence arise the claims by Wrench against Reynolds. Under the circumstances it was thought best by Mr. Justice Grove, when trying the case at the Huntingdon Assizes, that there the jury should try the question by whose fault the wrong seed was sent. The jury heard all the evidence, and came to the conclusion that the fault was that of Reynolds. Then came the question of damages, and, as it was a mixed question of law and fact, it was determined that it should be settled by Mr. Justice Denman without a jury. His lordship then referred to the facts brought out in evidence before Mr. Justice Denman, from which it appeared that Wrench sold the seed to Lawsons, of Edinburgh, on November 3, 1885, and that the invoice contained the following note, printed in red:—"Messrs. J. Wrench & Son give no warranty, express or implied, as to description, quality, productiveness, or any other matter connected with the seed." This note was not only on the invoice sent to Messrs. Lawson, but was also on that sent Reynolds. This note, continued his lordship, has been held by Mr. Justice Denman to afford protection to Wrench, but I confess that if I had to consider the construction of it *de novo* I should not agree with that view, because I should say, using the words of Lord Abinger in *Chanter v. Hopkins*, "a good deal of confusion has arisen from the unfortunate use made of the word 'warranty.' A warranty is an express or implied statement of that which a party undertakes shall be part of a contract, collateral to the express object." I should then go on to say that when a man undertakes to sell a perfectly well-known article, such as Yellow Tankard Turnip seed, whatever may be the description, quality, or other matter which is mentioned in respect of this seed, it is a condition precedent that it should be that seed, and that to deliver a different kind of seed would be a breach of the contract. But where the word "description" is mentioned I find it applicable to this question. Lord Abinger, in that case speaks of the circumstance of the parties selling a particular thing by its particular description. What was passing in his mind was, not "description" as if you speak of some collateral quality, such as "of good growth," but something more than definitive description. That is still more marked in the case of *Allen v. Bates*, to which his Lordship went on to refer and continued: "That being so we come to the conclusion that these words in red protect the vendor, and that if Lawson could not recover damages against Wrench then he could not recover against Reynolds. But then there is another question. If there was a special contract, as alleged by Wrench, that the words in red were not to apply to the sale of the seed to Lawson then it would be for Wrench to prove that Reynolds was aware that such special contract was made either by

express notice or by the usual course of trade. Reynolds ought not to have assumed that Wrench would sell the seed on any terms other than those contained on the invoices, and therefore as any damages arising from breach of a special contract were not in contemplation by both Wrench and Reynolds when the contract was made to grow the seeds, such damages cannot now be recovered.

Mr. Justice Charles entertained no doubt that the words in red protected Wrench from any claims made by Lawson, and in all other respects concurred in the judgment of Baron Pollock.

The application for a new trial was therefore refused.

ROSES.

TWO NEW ROSES.

At the fortnightly show of the Royal Horticultural Society, held at the Drill Hall on April 24, there were exhibited two new Roses which I think are likely to be very useful; they are indeed neither of them, in one sense, absolutely new, as they are not seedlings, but sports of old and well-known varieties, but none the less valuable.

May Rivers!—how delightful it is to find the old honoured name of Rivers of Sawbridgeworth connected with a new Rose. Malam Rivers has long since passed into the region of neglected Roses, and I fear I must say deservedly so, for we have so many better sorts that we can very well dispense with it. Raised by the elder Guillot, and sent out by him in 1830, it was attractive by its pretty colour and shape, but it was unhealthy and of weak constitution, and so has passed into oblivion; and now, some forty years afterwards, we again have the honoured old name associated with the Rose—a flower he did so much to popularize amongst us. May Rivers is a yellow sport from the old white China Rose, *Clara Sylvain*, which also appeared under the synonym of *Lady Warrenden*, a Rose which has by some been placed amongst the Teas, although Mr. Rivers in his *Rose Amateur's Guide* places it amongst the Chinas. Ellwanger in his book on Roses writes of it as a China with a considerable dash of Tea blood in it; while Ketten in his catalogue places it amongst the Teas; in this I think he is wrong, and Ellwanger's description of it is about the correct one. It has almost indeed passed out of cultivation, Teas and hybrids having absorbed the energies of Rose lovers. Mr. Rivers speaks of it as one well fitted for bedding, and owing to its strong and vigorous growth recommends it to be used for the centre of a bed. Of this Rose there appeared some years ago in the Sawbridgeworth Nurseries a yellow sport, and this, Mr. Rivers has been carefully trying ever since to fix, for he could not send out a Rose whose constancy was uncertain and which might hark back to the typical form. He now, considers it to be thoroughly fixed, and it will be, I believe, soon distributed. In colour it closely resembles *Belle Lyonaise*, but does not quarter as that flower does. In the box of twenty-four exhibited they were in all stages, from the bud to the full-blown flower, and in form and colour were admirable; moreover it is perfectly hardy, while *Belle Lyonaise* is not, and to have a thoroughly good hardy yellow Rose will be no slight gain to lovers of the flower.

The other Rose was exhibited by Messrs. Keynes, Williams & Co., of Salisbury, and is one of those curious sports in the matter of growth for which there seems to be no accounting, when we see a dwarf growing Rose like *Devoniensis* suddenly developing into one which makes a shoot sometimes 20 feet long in a season, budded on the same stock, as thousands of others have been, it is not easy to give a reason why it should take place; and probably there is no reason; as the Salisbury Rose is a climbing Niphotos, and it will at once be seen what a valuable help this is likely to be to those who supply cut flowers for market. If any one goes to Covent Garden at any time when Roses are to be had, it will be seen at once that the two Roses which

hold their own against all comers are Niphotos and *Maréchal Niel*. You will, of course, see others, and some perpetuals of bright colours, but they are comparatively few. These two Roses are to be seen in quantities, while when we go down to such places as Mr. Ladds' or Beckwith's, we find house after house devoted solely to the growth of Niphotos. How valuable, then, this sport will be for climbing on the rafters will be evident. This climbing variety makes shoots 20 feet long, and seems to be quite as floriferous as the parent, has the same long-pointed buds, and is of the same beautiful white—the whitest of all Tea Roses; and Messrs. Keynes & Co. are, I think, to be congratulated on this very desirable acquisition. *Wild Rose*.

ROSES ON WALLS.

In all parts of England except in the North, I think many more of the Tea-scented and Noisette Roses might be successfully grown on walls with a south and west aspect than is the case now. [They are grown there, but are protected in winter. Ed.] Many of these are vigorous growers, and the Noisettes in particular are less fastidious about soil, so long as it is fairly light and well drained. I am quite sure that it will not do to select from the Tea-scented varieties at random, for open-air culture, but by making choice of the hardiest, and planting these in suitable aspects there will be no danger of being disappointed. Amongst Teas I would recommend *Homor*, *Safrano*, and *Jaune Despres*; these are undoubtedly the hardiest of the moderate growing Teas. The first named is especially valuable, as it will flower abundantly in almost all parts of the country. Others of this section it is quite safe to choose are *Souvenir d'un Ami*, *Sombrenil*, and *Madame Falcot*. From observation extending over many years, I consider these to be the hardiest of the Teas. The hybrid Tea Roses are valuable, and there are many of them that are quite hardy enough for walls. I may mention *Reine Marie Henriette* as a variety rich in colour—a full bright crimson; it is also a vigorous grower. *Cheshunt Hybrid* is rather dingy in colour, being purplish-maroon, but the flower is large and full, and very sweetly scented; and, lastly, *Gloire de Dijon*, a Rose which may be said to be hardly ever without flowers. The Noisettes are represented by many excellent climbing varieties, some of them being fragrant as well as beautiful. Of these *Aimée Yibert* is so well known that I need not say more than that it is the hardiest of the section, and that its pure white flowers are always appreciated. *Celine Forestier* is, I think, the best yellow in this group, and deserves a foremost place; the plant grows rapidly, and produces beautiful clusters of flowers quite late in the season; *Rose d'Or* is an excellent Rose, with large and full flowers; *Solfaterre* also grows and flowers well; *William Allan Richardson* is undoubtedly the best in its shade of colour—a deep orange-yellow. The plant is of vigorous habit, and well suited for covering a small frame 16–20 feet high. If this Rose has one fault it is its sportiveness, many flowers coming nearly white, especially towards the end of the summer.

A fairly rich and well drained soil must be provided for the Teas, but the hybrid Teas and Noisettes are less fastidious. As regards the pruning of the latter, they are sometimes badly treated; as for the sake of making the plants look tidy much of the growth is cut away during the summer that should be retained to furnish flowers the next year. A sufficient number of the young long shoots should be nailed in with this intent, the small sprays not being productive of flowers. The winter pruning should not be done until some time in February, when any weak and exhausted growth that can be spared should be cut out, and the long shoots made the previous summer laid in at nearly their whole length when space can be found for them; in no case should these long shoots be cut out and the old left, except in the case of main branches that may have to be cut away. In respect to the time to plant, the end of February is the most suitable, when

plants that are taken from the open ground may be planted, but any that have to be turned out of pots and which have been kept under glass all the winter should not be planted until the beginning of the month of May. *J. C. Clarke.*

PLANTS AND THEIR CULTURE.

CAMELIAS.—Although these plants cannot in the later stages be forced into flower satisfactorily, the same end may be attained by forcing them when growing. All plants which have finished flowering should be encouraged to finish their growth as quickly as is consistent with safety, and a genial growing atmosphere of about 60° is very suitable for that purpose. The plants should be well syringed overhead, and shaded from bright sun; and if any require to be repotted, it is a good time to do it, just as the flower-buds are forming. Yellow loam of good quality, with a little peat and plenty of silver-sand, suit them well. They are much benefited by a moderately high temperature, and if kept in it until the flower-buds are well developed, the plants will flower early in the winter following without any forcing. Large plants in pots and have not been shifted, or such as are planted out, should be afforded some weak manure-water twice weekly, until such time as the growths cease to lengthen.

Violas in Pots.—These flowers are always much appreciated during the winter, and to that end strong well-established plants should be secured by the end of the summer. If not already done no time should be lost in getting in the required number of strong runners with prominent crowns. These should be potted singly in small pots, placed in a frame and kept rather close for a fortnight, or they may be planted out in well prepared beds on a border, the object being to secure plump crowns. The double varieties are the most useful for indoor culture, and probably Marie Louise is as good as any other; but for the sake of variety Neapolitan and Comte de Brazza may be included.

Poinsettias which have been resting should now be started by placing them in gentle heat and syringing freely, when plenty of cuttings may be taken. *F. Ross, Pendell Court.*

THE FLOWER GARDEN.

THE SEASON.—I shall make no apology for briefly noticing the abnormal character of the season in its bearing on vegetation, and especially on one or two operations in the flower garden, and which in the ordinary course of things would now be receiving attention. In ordinary seasons it is usual to begin bedding-out in southern counties about the second or third week in May, but there can be no question that in many gardens this work will have to be deferred to a later date. It must of necessity be the case where flower-beds are planted with Wallflowers, Arabis, Forget-me-Nots, Polyanthus, &c., owing to the lateness of their flowering, unless they are taken up whilst still covered with bloom, which, in my opinion, would be unwise. I do not doubt that many gardeners will be tempted to do this in spite of what may be stated to the contrary. They would do well, however, this year to exercise a little patience and for once, at least, to disregard dates, and anything savouring of "rule of thumb." In our garden we shall be obliged to defer planting certain beds to a later date than usual, sowing to their being filled with Wallflowers, margined with a broad band of Stachys lanata, and which at the present time are far from being at their best, but it would be folly to forego the pleasure of seeing such a charming sight as 4000 plants present, when in bloom, merely because the planting time for Pelargoniums had arrived. In gardens where the spring bedders have suffered much from frost, summer bedders may be put out as soon as it is safe to do so. See that the work in all other departments is kept close up, so that when summer bedding-out begins all the available strength may be employed on it.

Begonias.—Look over these, and give more space to the most forward plants, which may now be moved to a house where they will have the benefit of freer ventilation. Pinch out the points of the strongest shoots, and also all flower-buds that have made their appearance up to the present, so that sturdy plants may result. Those which are backward in growth, and the young plants which were

raised from seed, had better remain in a temperature of 65° to 70° for some little time longer.

Seeds.—The majority of hardy biennials may now be sown in the open ground. The seed-bed should be of fine light soil and ought to be specially prepared by having a little finely sifted leaf-mould and sand spread over the surface and raked in previous to sowing the seed in drills. Amongst other subjects which ought to be sown, the following are regarded as being indispensable in a good garden, viz., Antirrhinums, Brompton Stocks, Campanula calycanthemata and varieties, Lunaria biennis, Sweet Williams, Wallflowers Belvoir Castle and Covent Garden Blood Red; double German Wallflowers are worth growing also, and Dianthus chinensis. Cover each kind of seed with about its own depth of soil, water the bed if it becomes dry, and keep a sharp look-out for slugs as soon as the young plants make their appearance. A further sowing of hardy annuals may be made, if former sowings are not quite satisfactory, or if very late flowers are wanted. *J. Horsfield, Heytesbury.*

FRUITS UNDER GLASS.

VINES.—When the Grapes are ripe a cool dry atmosphere is indispensable to their keeping properly; but guard against a too dry state of the soil about the roots. If water be necessary choose a fine day, and remove the mulching from the border, giving a thorough watering, and re-cover with about 3 inches of dry mushroom-bed material. Where Grapes are colouring decrease the moisture in the house, and keep up a circulation of warm air. Red spider is almost certain to put in an appearance on withholding moisture, and in order to check their ravages in the earliest stages sulphur is perhaps the best remedy use. For this purpose mix up some flowers of sulphur to the consistency of thick paint, heat the pipes until they are uncomfortable to the hand, paint the upper surfaces of the flow-pipes, keeping clear of the joints, as it is difficult to wash off again from uneven surfaces; keep the house perfectly close for the night, but admit air as early in the morning as possible, as it would be highly dangerous to allow the sun to attain any power while the house is full of the fumes. Sulphur should never be used on flues, unless the upper ones are dished to hold water, when a little may be mixed with the water, or a vessel holding a gallon or two of water may be placed at a point far from the fire; and it is not safe to use it until the berries are stoned and the skin hard, or rust would be sure to disfigure the berries more or less. Houses which are colouring may be kept about 70°, at 10 p.m. Take advantage of solar heat, shutting up with a temperature of 90°, and considerable moisture. Muscats may now be kept at about 75° at 10 p.m. Do not thin them until such time as it is apparent which berries have seeds. It is better not to thin Muscats too freely at first, as it is easy to nip out a few berries later. In the case of free setters like Black Hamburgh and Black Alicante, the sooner they are thinned after they are set—the better. Attend to the stopping and tying of shoots as growth proceeds, but it is not good practice to pinch the shoots while the Vines are in bloom, on the contrary, rather allow the shoots and laterals to grow unchecked until fertilisation is finished. Colmars and Lady Downes are better when kept at about Muscat temperature at the flowering stage, but from the period of stoning to that of colouring, Lady Downes is subject to scalding of the berries; and if the house be shut up early, and well damped, this is almost a certainty. It will therefore be the safest practice to defer shutting up till the sun has gone off the houses, and a trifling amount of top ventilation should be left on all night. As regards the shading of Vines I know that many eminent gardeners condemn the practice, but when the Vines are not in robust health, I consider a slight shade afforded to Muscats and Gros Colmar very beneficial. I always give shade, and the material I use is Williams' Eureka Shading mixed to a thin consistency and syringed over the glass when the sun shines. Look to the young planted-out Vines and keep the stems tied to the trellis; guard against wire-worms where soil has been taken in from an old pasture, and if their presence be suspected, plant a few Carrots in the border, examining them daily, for should there be any of the insects in the soil they are certain to be found attached to the Carrots. Allow as many of the laterals to grow as can conveniently be retained, the object in view being to get a root development in proportion to the spread of foliage. Give every

attention to the supply of water, and frequently sprinkle the surface of the border, being careful not to allow any water to reach any very hot pipes, the steam from which produces warty foliage. *W. M. Baillie, Luton Hoe.*

THE HARDY FRUIT GARDEN.

GENERAL DIRECTIONS.—Continue the disbudbing of Peach and Nectarine trees, pinching in any gross growing shoots, by that means equalising the distribution of the sap. Should aphides appear the shoots should be dusted over with tobacco-powder, and after the fruit is set the trees should be thoroughly washed with the garden engine. Keep a careful look-out for blister, and as soon as it is detected the affected leaves, and shoots likewise, if necessary, should be cut off and at once burned. The protecting materials used on Apricot trees may now be dispensed with, the blinds, if such are employed, being let down for a few hours to dry before putting them into store. Any wooden copings which may have been put up should be removed. The trees should be examined, and all young shoots that are not required to furnish the trees should be stopped back to three or four buds, which by that means will form fruit-spurs for another season. The fruits are now swell fast, so that a little thinning may be done, removing some of the smallest and such as are badly situated on the branches. The final removal of the protecting material from Figs may now be done, and the wood thinned out and nailed to the wall.

All grafts must be examined, and the clay kept in a moist condition by sprinkling it with water; and when moss has been bound round the clay as advised, an occasional damping of the same will suffice. Fruit quarters and borders will be greatly benefited by being frequently hoed. Pears, Plums, and Cherries are thickly studded with flower-buds, and if the weather should continue mild the trees will soon be in full bloom. Apples are very backward, but they will now advance very fast, and the next few weeks will be an anxious time for the growers of hardy fruits. *A. Ward, Stoke Edith Gardens, Hereford.*

THE KITCHEN GARDEN.

SCARLET RUNNERS.—The seeds of the first crop should now be sown, and where the soil of the garden is of a cold nature, or the situation is an exposed one, the warmest position for this first sowing should be given it, or much of the seed may rot. In any case it will be advisable to work the soil where the drills will be made with a fork once or twice before sowing. Scarlet Runner Beans require a great deal of water in dry weather; it is well, therefore, to sow in rather shallow trenches, made by throwing out a few inches of soil, and laying it at the sides, and in case the land has not been heavily manured already, a good quantity of rotten manure should be dug into the trench, and the seeds sown 4 inches apart. If the garden is well sheltered, rows 8 feet apart are the best. In windy places two rows of seed 9 inches apart may be sown in each trench, and the stakes put in diagonally, so as to cross each other, the tops being about 3 feet apart; other long sticks may then be placed lengthwise along the centre of the row where the others cross, and all be tied securely together, by which precautions they will then withstand the rough winds without being blown over. Another plan is to stop the plants when 3 feet high, and grow them without sticks, sowing the seed in single rows at 4 feet apart; many acres are thus grown in the market gardens near London. Champion and the old Scarlet are the heaviest croppers, but The Czar and Girtford Giant produce the finest pods.

Beets.—The main crop should now be sown, and as smallish roots are preferred generally, a plot that has not had any manure during the last twelve months should be selected for it, and if the soil be of a heavy nature it should be well worked with a fork or Canterbury hoe. Pragnell's Exhibition is one of the handiest varieties, and the Egyptian Turnip-rooted will be found very useful on shallow and stony soils, and for coming into use early. Salsafy, Scorzonera, Witloof, and Chicory require similar treatment to Beets, and may be sown now. A few French Beans should also be sown on south borders; Sir Joseph Paxton is one of the best varieties for the first crop. *W. H. Divers, Ketton Hall, Stamford.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

Bedding and Greenhouse Plants,
at Child's Hill Farm Nursery,
Finchley Road, N.W., by Pro-
theroe & Morris.
FRIDAY, MAY 18 { Imported Orchids, at Protheroe &
Morris' Rooms.

ALTHOUGH some fifteen years have now elapsed since the *Agricultural Gazette* ceased to form an integral portion of the *Gardeners' Chronicle*, there must still be many of our readers who remember its genial, straightforward agricultural Editor. Mr. MORTON was associated with this journal from 1844 till 1873, and during much of that time frequent personal association—continued more or less up to the date of his death—had led us to respect him most highly for his talents and unflinching energy, and still more, to admire and revere him for his personal qualities.

His services to agriculture will long be held in remembrance, for a more thoroughly competent adviser, or one more transparently just, honest, and straightforward, never wielded pen. The possessor of knowledge of the art and science of agriculture, wider and more extensive probably than that of any of his contemporaries, he was eminently endowed with broad comprehensive views, a readiness to accept and develop new ideas, but tempered with sterling common sense. Add to this his kind-heartedness and genial frankness, and some notion of the extent of his loss may be formed even by those who had not the happiness of his personal acquaintance. Mr. MORTON was associated with the *Agricultural Gazette* from its foundation up till the present time; but such were his energies and his power of work, that he found leisure to undertake other literary work, such as the *Cyclopædia of Agriculture*, and numerous papers and memoirs in the *Journals of the Royal Agricultural Society*, the *Society of Arts*, &c., crammed with well sifted facts and careful deductions; while the Handbooks on agricultural subjects published under his editorship form a most valuable series of works, in which the teachings of modern science are brought to bear on the practical work

of the farm. Mr. MORTON also served on the Rivers Pollution Commission with Dr. FRANKLAND and Sir W. DENISON, and at the time of his death he was one of the Inspectors of the Land Commission.

Mr. MORTON, who was born in 1821, was the son of the agent to the Earls of DUCIE in Gloucestershire, and was a nephew, on the mother's side, of Dr. CHALMERS. He pursued his studies in Edinburgh, attaining distinction not only in agricultural but in mathematical subjects. On leaving the University he undertook the direction of a model farm, and from that day literally to the day of his death he was always in harness, always at work—never allowing himself to be depressed by the low estate into which agriculture has fallen, but always hopeful and confident himself, and endeavouring to inculcate cheerfulness in others.

Mr. MORTON died suddenly, at his residence at Harrow, on Thursday, May 3, after a characteristically hard day's work at the editorial desk, supplemented by a business journey into Essex. It is probable that he would have preferred such a termination to his long and useful career rather than to have awaited the inevitable lot, while no longer capable of taking part in the active duties of life. But the shock to his widow and family is such as to secure for them the most respectful sympathy. As time goes on, the knowledge of the profound esteem in which JOHN CHALMERS MORTON was held will serve to temper in some degree their abiding sense of his loss.

A number of agriculturists—including Sir JAMES CAIRD, K.C.B., Mr. ERNEST CLARKE, Secretary to the Royal Agricultural Society, and Mr. TRESHAM GILBEY—were present at the funeral, which took place at the parish church of Harrow on Wednesday afternoon. The chief mourner was Mr. E. J. C. MORTON, the son of the deceased gentleman. A number of wreaths were sent by agriculturists, including some from those employed on the *Agricultural Gazette*, Mr. MARTIN J. SETTON, Mr. FAUNCE DE LAUNE, Mr. WALTER GILBEY, Mr. WALTER DARRIN, and Mr. JOHN THORNTON.

For the opportunity of reproducing the excellent portrait on p. 555, we are indebted to the courtesy of the proprietors of the *Agricultural Gazette*.

DISA RACEMOSA.—This beautiful South African terrestrial Orchid, which had been known to science for many years, flowered for the first time in cultivation with Mr. JAMES O'BRIEN, of Harrow-on-the-Hill, in October and November, 1887, its description, with a lengthy cultural note from its successful cultivator, appearing in the *Gardeners' Chronicle* of December 31, 1887. We are also indebted to Mr. O'BRIEN for the means of giving our present illustration (fig. 81). From the cultural note accompanying the description at p. 811 referred to, it appears that *Disa racemosa* is of the simplest culture, those which flowered having been grown in a shady place outdoors all summer and early autumn, and were afterwards removed to a shelf in a cold-house, where their handsome rosy-crimson and purple flowers were produced from four to nine on a spike, abundance of rain-water being given the plants always. It belongs to the free-growing section of *Disa*, of which that general favourite, *D. uniflora*, Berg. (*grandiflora*), may be taken as the type, and, with which *D. racemosa* is in every way worthy to be associated.

THE GARDENERS' ORPHAN FUND.—A novel and original idea has occurred in connection with this Institution, and one which, if carried out, as it doubtless will be, with the zeal and business-like skill with which the affairs of this new Institution have hitherto been conducted, will doubt-

less prove a great success. The proposal is to hold an evening *file* in the wholesale flower market in Wellington Street, adjoining this office. There will be no exhibits in the ordinary sense of the term, and no prizes, but the holders of the stalls will form an exhibition of their own produce, just as they do on ordinary market nights, with the exception, that when the flowers have been arranged as they usually are for the purposes of sale, the ordinary business will be suspended or postponed for an hour or two, the place swept and garnished, and the public invited to come and see, and contribute to the coffers of the Orphan Fund. His Grace the Duke of Bedford has most willingly consented to the scheme, and it is confidently expected that the growers and salesmen will lend cordial co-operation. The particular evening, as well as other details of the scheme, have yet to be settled, but every one who sympathises with the object in view, and every one who can appreciate the skill and enterprise of the market growers, and the excellence and beauty of the results they obtain, as well as the originality of the proposal, will assuredly view it with favour.

THE TEMPLE SHOW.—The floral exhibition, to be held by the Royal Horticultural Society on Thursday and Friday next in the gardens of the Inner Temple under the auspices of the Lord Mayor and the Treasurer and Masters of the Inner Temple, promises to be one of great magnitude and interest. Tickets may be obtained at the office of the Royal Horticultural Society, 111, Victoria Street, S.W.

THE COUNCIL OF THE ROYAL HORTICULTURAL SOCIETY.—We learn that Mr. DOUGLAS has been appointed to succeed Mr. WOODRIDGE on the Council of the Society. It is much to be desired that several more representative gardeners should be placed on the Council.

GLASGOW INTERNATIONAL EXHIBITION.—We hear that Messrs. J. & R. THYNE, of Glasgow, received the thanks of the committee for the excellent manner in which the floral decorations were carried out on the occasion of the opening ceremonial. The bouquet presented to the Princess of WALES by Lady KING was prepared by Messrs. HARLEY & SONS, of Covent Garden, Glasgow, and Dundee. The flowers were white Orchids, Lily of the Valley, and Stephanotis, which were relieved by fronds of *Adiantum*.

MR. D. T. FISH.—We are very glad to hear that the new Council of the Royal Horticultural Society has taken the first opportunity to repair the scandalous injustice which was inflicted—it is not worth while to say how—by their predecessors on Mr. D. T. FISH. Mr. FISH, perceiving that the insult was the result of a blunder, and not intentional, has agreed to let bygones be bygones, and we shall hope to see him one of the most active of local secretaries.

"BOTANICAL MAGAZINE."—The plants figured in the May number are the following:—

Dendrobium clavatum, Wallich, t. 6993.—The pseudobulbs of this species are erect elongate, with oblong-lanceolate leaves and racemes of orange-yellow flowers, nearly 3 inches across; sepals oblong acute; petals broadly ovate, lip convolute, dentate at the edges, pale yellow, with a crimson throat, and prolonged at the base into a conical spur. It is a native of Kamaon and Assam.

Alpinia officinarum, Hance, t. 6995.—Root-stock creeping, thick, sending up lanceolate leaves and a central spike of white flowers with a white lip, striped with crimson. This is the lesser Galangale, formerly in repute as an aromatic stimulant.

Douglasia levigata, A. Gray, t. 6996.—See *Gardeners' Chronicle*, April 28, p. 525; and May 5, p. 564.

Passiflora violacea, Vellozo, t. 6997.—A very beautiful Passion-flower, native of South Brazil, with three-lobed leaves, the lobes oblong-lanceolate, spreading; the peduncles are very long, the sepals tapering into very long leafy horns; rays of the

FIG. 81.—DISA RACEMOSA: FLOWERS ROSY-CRIMSON. (SEE P. 502.)

corona white, in the centre, lilac at both ends; petals lilac.

LINNEAN SOCIETY: CENTENARY CELEBRATION.—The hundredth anniversary of this flourishing Society occurs this year, when it is proposed to celebrate the event in the following manner:—On Thursday, May 21, at 2.30 p.m., the President will receive the visitors. At 3 p.m., the President will take the chair. After introductory remarks by the President, and the conclusion of the formal business of the anniversary meeting, the Treasurer will lay before the meeting an account of the financial condition of the Society during the last century. The Secretaries will give a history of the Linnean books, herbarium, and other collections. The President will deliver the annual address. The following Eulogia will be pronounced:—"On LINNÆUS," by Professor THORE FRIES, the present occupant of the Chair of Botany at Upsala, formerly held by LINNÆUS. "On ROBERT BROWN," by Sir JOSEPH HOOKER, K.C.S.I., F.R.S. "On CHARLES DARWIN," by Professor FLOWER, C.B., F.R.S. "On GEORGE BENTHAM," by W. T. THISELTON DYER, C.M.G., F.R.S. A Gold Medal, to be awarded annually to a distinguished naturalist, has also been instituted, and on this occasion two such medals will be presented, one to Sir JOSEPH HOOKER, K.C.S.I. (botanist), and another to Sir RICHARD OWEN, K.C.B. (zoologist). In subsequent years the presentation will be to a botanist and zoologist alternately. At 6.30 p.m. the annual dinner will be held at the Hotel Metropole, the President, in the chair. On Friday, May 25, at 8 p.m., the President and officers will hold a reception of the members and visitors in the rooms of the Society at Burlington House, Piccadilly, when the Linnean collections and relics will be exhibited.

VEITCH MEMORIAL PRIZE.—At the Bath Chrysanthemum show, November 7 and 8, the above prize will be awarded for eight plants, not blooms, as was previously stated.

THE LATE MR. J. DAYS' ORCHIDS.—This fine Orchid collection was disposed of by auction at Mr. STEVENS' rooms in Covent Garden on Wednesday and Thursday last. The following are some of the high prices realised on the former day. *Cypripedium* were most sought after, and for a plant of *C. Stonei platyctanum* with two leads the sum of £159 12s. was paid—the highest price of the day; one plant of *C. Morganii* realised £35 4s., and for the new hybrid, *C. Charles Canham*, £34 13s. was bid; *C. orphanum*, £29; *C. Arthurianum*, with four growths, £21; and the same figure was reached for *C. macropterum*; *C. Sallieri* was sold for £14, and for the same number of *guineas C. Curtisii* with six leaves; *C. Curtisii* and *C. Harrisianum superbum* together brought £20, and *C. Schroderæ cœnanthum* II guineas. *Cattleyas* also realised well; a plant of *C. Wagneri*, with twenty-eight bulbs, fetched £15 4s. 6d.; II guineas was paid for *C. Reineckiana* (thirteen bulbs), and for *C. exoniensis* (seven bulbs), *C. Skinneri* going for 10 guineas; and the same price was paid for *Vanda Lowi* with thirteen leaves.

ILLUSTRATIONES FLORÆ INSULARUM MARIS PACIFICI.—The fourth part of M. DRAKE DEL CASTILLO'S series of plates representing certain plants of the Pacific islands, is chiefly confined to certain shrubby Composites, which are of purely botanical interest.

SHOW FIXTURE.—A Rose and fruit show will be held in Dursley on July 4 next.

THE LATE MR. JOHN WOODBRIDGE.—To the record of the good work done by the late Mr. WOODBRIDGE may be added the fact that he was a most active member of the second Hailstorm Fund Committee—a fund raised to assist many small nurserymen and florists, who lost heavily by the hailstorm which played such havoc in the Richmond district a few years ago: and he rendered valuable assistance in visiting the nurseries and gardens, and estimating the amount of damage done.

NURSERY NOTES.

MR. W. BULL'S ORCHID SHOW.

It would appear as if the show of Orchids at this nursery was to become one of the prominent sights of the season, and we may say at the outset that there is no falling off in the beauty of the display as a whole, nor in the numbers and rarity of the plants. The bulk is, of course, composed of older favourites, themselves mostly rarities of worth in their day, and which are mostly well flowered and grown. The same house is set apart for the exhibition as in former seasons, and much artistic taste is apparent in the arrangement, and especially in bringing together at conspicuous points the finest Orchid gems in Mr. Bull's possession. Thus in one group we observed three forms of *Lælia purpurata*, *L. p. Victoria*, with petals of ivory whiteness, contrasted admirably with the deep purple lip; *L. p. erubescens*, in which the white was suffused with a faint rose colour; and *L. p. Wyattiana*, a still paler form, with an elongated lip. It is named in compliment to an enthusiastic orchidist—Mr. Wyatt, of Cheltenham.

In another little space were gathered several of those beautifully eyed species of *Dendrobium*, viz., *Paxtoni*, *suavissimum*, and *ochreatum* (Cambridgeanum), which latter produces its flowers of orange and crimson on the young growth; it is a plant to test the cultural skill of the gardener, and is seldom found in first-rate condition. Scattered through the house the following species of *Dendrobium* were found:—*D. Griffithsianum*, resembling in general aspect the better known *D. densiflorum*, but whose drooping racemes of flowers are of a purer yellow colour, and larger than those of that species; *D. fimbriatum*, pure yellow, and the lip of a darker shade, with fringe on its lower margin; *Farmeri*, the handsome bearded *Brymerianum*, in nicely flowered examples; *Dodsoni*, one bloom only on the plant—a rarely flowered species; *grandiflorum*, white and yellow flowers in racemes; a particularly fine *nobilium*, with half-a-dozen blooms, and with an almost prohibitive value attached to it; *albo-sanguineum*, a widely expanded flower, of pale fawn, and throat of a crimson colour; *densiflorum Wardianum*, and *clavatum*. Although *Dendrobies* are taken first, they do not give quite so much character to the present aspect of the house as do the *Mendelli* section of *Cattleyas*, and some few other species of *Cattleyas*. Of the former may be noted *C. M. grandis*, of suffused pink on white, lip fine purple, and with a faint yellow stain in the throat; *C. M. magnifica*, *C. M. tinctoria*, of a rich rose colour, lip light purple, and the opening to the throat of a pure white—a fine thing; *C. Marstoniana*, petals and sepals of amethyst, pure white side lobes to the lip, and the middle lobe of an intense purple—a seedling from *C. labiata*; *C. Schilleriana*, of rosy-brown, and the lip edged with pink; the new *Roraima* species, *C. Lawrenceana*, of which several plants were observed; *C. Skinneri*, a late flowering form of *C. Trianae*, named *magnifica*, with sepals and petals white, suffused with rose, and lip a rich crimson; the pale *C. Schröderi*, palest pink coloured, and very fragrant; also the white form of this species; many *C. citrina* hung from the roof.

Next to the *Cattleyas*, *Odontoglossum crispum* in many superb forms were perhaps the most numerous species; plants of *O. citrosimum* and *O. citrosimum roseum* and *album* were suspended from every point of vantage, and added considerably to the felicity of the arrangement. *O. Pescatorei*, *O. triumphans*, and *O. polyxanthum* were in considerable numbers. *O. Cervantesi*, *O. Rossi* majus were arranged in little groups, nestling amongst the larger species; also observed was the newer *O. phymatocillum*, a long spike, with numerous flowers.

In *Epidendrums* there were observed *E. Hanburyanum*, a fine spike of small green and brown; *E. leucocillum*, *E. Stamfordianum Wallacei*, and *E. Wallisi*. A few *Saccolabiums* were distributed here and there, as *S. retusum*, *S. præmorsum*, one fine large spike of this now seldom seen species. Of *Cym-*

bidiums were *C. Lowianum*, *C. L. atropurpureum*, which lasts three months in bloom; and *C. L. lutescens*. The latter has much the larger flowers of any of the *Lowianum* section, and all of these plants carried numerous long spikes of flowers.

Adding still more to the brilliant mass of colour were plants of *Masdevallia regalis*, *M. acanthifolia*, and *M. Crossii* with several flowers on one stem; *Epidendrum prismatocarpum*, *Lælia cinnabarina*, and *Anguloa Ruckeri sanguinea*.

In white flowers we noticed a plant of the summer blooming species of *Angræcum sesquipedale*, with three blooms; *Calanthe veratrifolia*, *Lycaste Skinneri alba*, with five flowers; besides several pieces of the Trentham variety of *Cœlogyne cristata* and *Miltonia Roezlii*. *Miltonia vexillaria* was represented in many shades of rose, numbers of new varieties and species of *Cypripedium*, and many other Orchids which want of space forbids our mentioning, were to be observed in the collection.

THE BULB GARDEN.

NOTES ON SOME VARIETIES OF NARCISSUS.

NARCISSUS INCOMPARABILIS LEEDSII.—This should be grown extensively in every garden by all lovers of the *Narcissus*. The perianth segments are rich yellow, and the cup is stained a fiery orange colour, and which keeps bright for many days; the perfume, too, is most refreshing. Pick the flower just as the points are separating and let it open gradually in the house.

N. BARRI CONSPICUUS.

I wish that, with each returning spring, flowers of this beautiful variety could be on the table in every English home. I am not sure that any other kind has so many good points—hardiness, free growth, and free flowering, fine form, cheerful colour, with a bright orange edge like a halo of sunshine to the large cup, and, to crown all, delightful perfume. I first bought this in 1879, before it was *Barri conspicuus*, and again a year later under its present name, but I do not grumble at this, as I have none too many even now.

N. M. J. BERKELEY.

If this were plentiful I am sure it would be a very great favourite. The flower is the largest I have ever seen; the colour is clear bright yellow, and it is almost a self, the difference between the shades of the perianth and the trumpet being scarcely perceptible. The trumpet is a good length, and the way in which it is recurved or rolled back at the mouth attracts the eye at once, and the laceration or jagging of the edge is remarkable. A flower that I measured was $4\frac{1}{2}$ inches across the perianth, and $2\frac{1}{2}$ inches across the trumpet. It appears to have a good constitution, and to grow freely. This and *N. maximus* were planted side by side in 1885; *maximus* has made no progress, and is giving but a single bloom, whilst this has grown into a nice little clump with four fine flowers.

N. MINIMUS.

A real little gem, of which considerable quantities were imported last autumn; consequently, the price is now reasonable, and it ought, therefore, to be largely grown. There has been great difficulty in obtaining the true variety, *N. nanus* being usually substituted for it; but in 1884 I was so fortunate as to get a bulb of the true kind from Backhouse. This was planted on the rockery, and it is now a nice little clump, and has given me six of its lovely flowers this spring. In 1886 I had some imported bulbs from Ware, which appear to be true, although the foliage is very long and narrow—quite different from that of Backhouse's bulb. In the importation of last autumn there is a good deal of variety in the character and colour of the flowers, as also in the foliage and height of the plant. Some of the flowers are scarcely 2 inches from the ground,

whilst others are nearly 6 inches high. This variation will give additional interest to this beautiful little flower.

N. NELSONI.

What a peculiar beauty there is about this flower; its form and colour are so chaste and unlike any other kind. The perianth segments are stout, of the purest white, and are most elegantly curved, whilst the yellow straight trumpet has a wonderful finish about it. In one way this flower always causes disappointment, as it gives one the impression of being scented, and usually it is at once carried to the nose, only to find that it lacks one point of being perfect. It is a grand grower. I have it under trees and in the open: in poor, rich, light, and heavy soils, and everywhere it thrives and gives its lovely blossoms. N. Nelsoni aurantius is not nearly so perfect a flower as the typical plant, neither is it such a free grower; but the trumpet has usually a good deal of orange stain on it, which gives it great brightness for several days, and makes it very attractive. *Jay Aye.*

THE APIARY.

It appears from a contemporary that modern bee-keeping has penetrated to the Holy Land. Most

see them filling glass supers, and may be witnessed with perfect safety. It is only necessary to keep the glass warm with a piece of flannel. There are some who find it difficult to dispose of bell-glasses; but if resident near a town they need not be kept long, as persons are sure to be found ready and able to buy these beautiful things.

We regret to hear that the British Honey Company is about to wind-up, as they are unable to meet their liabilities. The shareholders are the greatest losers by this, and not the general bee-keeper. Each bee-keeper will be obliged to find his own market. We do not consider this to be an evil. If a company were established to sell Carrots, for instance, small growers of Carrots would get very little for their produce. It is always the notorious middleman who gets what profit is to be had. However, the promoters of the Honey Company worked for the general good, and we are sorry to find they have been unsuccessful. *Bev.*

USEFUL INVENTIONS.

RICHARDSON'S PATENT UNIVERSAL JOINTS (FIG. 82).

HOT-WATER engineering is so closely connected with gardening that it may rightly be termed a

FIG. 82.—RICHARDSON'S PATENT UNIVERSAL INDIA-RUBBER EXPANSION JOINT.

good and devout people think that the time is soon coming when the Jews are going to return to their own land; and in anticipation of this, some of our own countrymen are setting up industries there. Many of the most interesting places mentioned in the Bible have apiaries already established, and now we hear there is a large one to be established on Mount Carmel. Mr. Howard, of Peterborough, is to make and send fifty hives there. It would, however, be a good thing for every one concerned if our race of bees got established there, as the Palestine bees are great stingers. We hope to report further about this apiary at a future time. The flora of the Holy Land is eminently adapted for bee-keepers, and many a modern Jacob will in the future be able to send his son "a little honey."

In the same paper we hear a good word also spoken for our old friends, bell-glass supers. Since sections have been introduced, glass supers have more or less gone into the shade; but surely there is nothing more beautiful than a bell-glass full of pure honeycomb. They seem to be appreciated by strong colonies of bees, and readily filled. Some people say bees do not readily take to them, but if a hive is boiling over with bees, as it is when honey is abundant, they will take to anything, and store honey in anything. It is also a beautiful sight to

branch of the profession, and a knowledge of the latest improvements is of service to many, especially where it is desired to carry out alterations on the best principles. J. H. Goodacre, The Gardens, Elvaston Castle, Derby, in a communication, says:—"It is generally admitted that the indiarubber expansion joints, providing the joint is formed on the pipe or connection, and not by loose rings, are safer than the old socket joints caulked with yarn and cement, these latter often bursting in the most awkward positions, and leaking during severe winter weather. In Richardson's universal joint the work of connection may be carried out in any position or angle with the same freedom as the ordinary socket pipes, and it may be fixed to any existing apparatus without additional special castings, as all the fittings are ready made with a plain seating for the rubber at one end, and a clip flange and hooked bolt lugs on the other, and withal so simple in construction that any ordinary workman can fix them. The joint is very durable, and will withstand an internal pressure of 125 lb. to the square inch. We have a range 350 feet long, heated with pipes connected on this system, which has proved most satisfactory, never having had a single leakage or trouble of any kind, and I shall have pleasure in showing it to any one at any time."

HOME CORRESPONDENCE.

IRIS STYLOSA ALBA.—"Honour to whom honour is due." This plant, for which Mr. Ware obtained a First-class Certificate at a recent meeting of the Royal Horticultural Society on April 10, was discovered some years ago by the Rev. Edwyn Arkwright in the neighbourhood of Algiers, and transplanted into his garden there; it was a unique specimen, and as the news of the discovery spread, Mr. Arkwright received many applications for pieces of it. He gave it to several people, myself among the number, and it has lately blossomed here in the open ground. It is a lovely and distinct variety, and the pure white flowers with their spots of yellow stand up well above the mass of leaves instead of being buried amongst them, as in *Iris stylosa*. *C. Sullivan, Broom House, Fallow.*

EUCALYPTUS URNIGERA.—I was much interested in the notice of the Whittinghame Gum in your paper of April 14, to which my attention has only to-day been directed. I was also much pleased to see the engraving. It must be a beautiful tree. Why are its measurements not given? You were right in supposing that it was to it that I alluded in my paper to the Edinburgh Botanical Society, which appeared in the *Transactions*, and also in the *Gardeners' Chronicle* (1886, November 27, and December 4). In it I mentioned that "it was planted (sown?) at Whittinghame in 1845, was cut to the ground by frost in 1860, but sprang again from the root, and is now more than 60 feet in height." You do not, however, mention the most interesting fact in connection with this tree—that it not only blooms but matures seed, and that Mr. Lindsay, of the Edinburgh Botanical Gardens, in 1886 succeeded in raising plants from the seed. This was enough to make the Whittinghame Gum famous, as from it we are possessed of Scotch Gum trees. It is, however, further notable by having borne four distinct names. In early life it was known as the Whittinghame Weeping Gum (*Eucalyptus viminalis*), having been declared to be such by a high authority in the botanical world. In deference to another high botanical authority this name was changed to the Whittinghame Cider Gum (*Eucalyptus Gunnii*). Under this name the plants raised from seed by Mr. Lindsay were sent out. I saw these when seedlings, and at once said—"The name is a mis-nomer." The seedlings are now so far grown that their characteristics are somewhat fully developed, and I write to say that the name of the Whittinghame Gum must a third time be changed, and that it must appear under a fourth name. It is neither *Eucalyptus viminalis* nor *E. Gunnii*, nor is it *E. urnigera*; but it is *Eucalyptus cordata*, of which *E. urnigera* is a variety. Both *E. cordata* and *E. cordata* var. *urnigera* grow in Arran. *D. Landsborough.* [*E. urnigera* is now considered distinct from *E. cordata*. Ed.]

MASSING OF ROSES—I am exceedingly sorry that "Rosa" should feel aggrieved at any remarks of mine, and can only assure him that the question about Madame Favart was asked simply for information. A name so celebrated seems a natural enough one for a Rose, and I cannot but think that the names Madame Lambert and Madame Favart (if it was Madame Favart; it seems to me as it had been another name) [Yes, Madame Favart was a printer's error] sufficiently different to excuse anyone's instinctively interpreting the one to be the other. There are myriads of Roses in existence whose names are no longer generally familiar, and it is only necessary to look into a Continental Rose grower's catalogue to find dozens of varieties which have never been in cultivation to any extent, if at all, in this country; so that there was nothing improbable in the supposition that "Rosa" had found useful some variety which other growers had overlooked. However, my sympathy is so entirely with "Rosa's" object, that if I was thereby betrayed into any unnecessary abruptness of expression, I can only offer (if you think it worth the space) to compile a list for "Rosa" to pull to pieces, and hope that if the printer succeeds in "fixing" any new sport, that "Rosa" will not hesitate to inquire how, when, and whence it was raised. *Theta.*

GOLDEN HODGENS' HOLLY. I am sorry to see reproduced the statement about the Golden Hodgens' Holly, which I did what I could to correct many years ago when I found it out, that it never originated at Bangholm Nursery, but at Mr. Hodgens' nursery at CloughJordan in Co. Tipperary,

whence grafts were taken, and Messrs. Lawson sent it out, first as *Ilex Lawsoni*, but ultimately dropped this name. All these facts I had from Mr. Hodgson himself. *W. E. Gumbleton.*

IVY ON TREES.—"Who shall decide when doctors disagree?" In one of your numbers last autumn a correspondent told us that in removing Ivy from trees one ought first to kill it, and not be in too great a hurry to take it from the tree. Now, in your last number we are told that the worst thing to do is to leave the dead Ivy on a tree, as it will infallibly ["in all probability"] kill the tree if it is so left. Probably the truth lies somewhere between the two statements. One can understand that a tree which has for a long time been encircled by Ivy may become tender, and that it may not be well to remove the Ivy all at once. But when the Ivy is dead, and its hold on the tree relaxed, then it is probably best for the tree to remove it. I have several trees here that have been killed, and are being killed by live Ivy, but I have yet to see that those on which the Ivy has been cut will be killed by it. I should be glad if some one who knows would throw some more light on the subject, as I have many trees here which are more or less overgrown with Ivy, and I am anxious to know the right way of dealing with them. *R. E. J.*

—We have upon the lawn here some very old Scotch Firs clothed with Ivy to the topmost branch. It is the wish of my employer to rid the trees of this burden, but I fear that, after being covered for so many years, the trees would feel the loss too much, and the losing of the trees would be irreparable. Will some of your correspondents say if we may venture with safety to sever the Ivy at the base, also if it is detrimental to the growth of timber? *Head Gardener.*

DESTRUCTION TO SPRUCE FIR BRANCHES.—It may be interesting to know that the same sort of injury to the young shoots of Spruce Fir trees has been going on here for the last two or three months as represented by two correspondents in last Saturday's issue of the *Gardeners' Chronicle*. My attention was first attracted to the mischief done while walking along a public road overhung at the sides by the branches of several large Spruce Firs. The part which they overlapped was literally strewn with fresh young shoots of last year's growth. On picking up some of them for examination to find a cause, I could soon discover that it was the work of crossbills, which are numerous in the woodlands here, more especially this season, which possibly may be owing to the severity of the winter on the Continent. The buds surrounding the base of last season's growth of the denuded spray, as well as others nearer the extremities, were mostly all extracted, thus showing that it could not be the work of any other creature than birds, and although I have not actually seen them at work on the Spruce Fir, I have frequently watched their operations in extracting the seeds out of Larch cones, and the very interesting manner in which they twist and wriggle round the pendant spray to get the seed out, and the not infrequent disappointment they receive by the dropping of the cones before many of the seeds are extracted. The enclosed samples of spray and cones will show the effects of their work, and the force required to twist the cones off, with a footstalk of wood attached to each. As will be seen by the freshness of detachment in some of the specimens, these birds are still here; and I imagine there are some of them remain here constant, as some years ago several nests were found near the top of smooth-stemmed Scotch Fir trees on this estate, from 30 to 40 feet in height. I may mention that we have very few squirrels in the woods here at present, a man being constantly employed to shoot them, and both he and the keepers are remunerated for every squirrel's tail they bring in, so that there are now very few to be seen. *J. Webster, Gordon Castle Gardens.*

AMMANFORD GARDEN.—I have just now found myself at the house of an old friend, though miles away from the spot where I saw her last. The proprietor's heart was nearly broken by the asperity of the climate with which she had to battle at Ashmore Rectory. Plants and bulbs quite refused to be happy there, and as her husband's health was very much on a par with that of her plants—certainly no better—they thought they had the best of all reasons for striking tent, and for seeking a habitation elsewhere. Just about the same time her son was intent upon agriculture; but agriculture did not look so very

kindly upon him, and the upshot of it all was, that after some deliberation, horticulture was what found most favour in their eyes, and to horticulture Mrs. Davidson and her children have entirely given themselves up. It is not often that business and pleasure go so completely hand-in-hand, and while the main consideration is certainly thought of here, the whole family is so devoted to the cultivation of flowers, that a cursory inspection of the place might almost lead one to suppose that pleasure rather than business is what is mainly desired. It is, however, because the business is pleasure and pleasure is business, that the whole thing is so well done at Ammanford. Mr. and Mrs. Davidson have taken a property on lease for twenty-one years, and they hope soon to get it by purchase completely into their hands. The house stands in the midst of gardens and fields of about 22 acres in all in extent, and already large glasshouses and numerous beds of flowers show what progress has been made. Indeed, it is wonderful that in two years so much should have been done. Of course, some mistakes were made at the outset, and here, as elsewhere, experience has to be bought at a price; but if anything may be prognosticated with certainty about gardening affairs, it is that the worst of the difficulty is over, and that this new and very enterprising firm is on the way to success. I use the word firm merely because I am writing of a *bonâ fide* business affair, and that seems to be the most suitable word to employ. It really is a very happy family, which is very happily engaged. Large glasshouses, some of them 100 feet long by 20 feet broad, meet the eye at once as you drive up to the place; others are of lesser dimensions, but there is no mistaking the nursery look of the whole affair, and that much work is being done here. One house is nearly full of Tea Roses, which climb up all over the rafters, and myriads of buds must have been cut in it during the dark days of winter. They have now quite passed their best, but still it is a very pretty scene. In another house *Lilium candidum* reigns supreme, and large pots are full of this queen of all Lilies in full bloom, whose elegance is not to be surpassed. But *miscuit utile dulci* is by no means forgotten here, and hard by, in a large erection which suits them, Tomatoes are being taught how they are to grow into money; and so also it is with many other things which are conducive to the main chance; and most of them seem to be doing well. There is an energetic, painstaking foreman hard at work, who takes the greatest interest in the rise and success of this new South Wales nursery. Apart, however, from all other considerations whatsoever, there is much in this place to interest any lover of flowers. Mrs. Davidson would not be herself if she were not growing under glass, and away from glass, in large prepared borders, and in retired nooks and corners, many of her favourites of former days. In her greenhouses, *Eschynanthus grandiflorus*, *Streptosolen Jamesoni*, and *Schubertia grandiflora*, especially attracted my notice; and *Hymenocallis macrostephana* and *Stephanotis floribunda* were thoroughly at home, Narcissi may be counted by the thousand in the open ground, and a rich feast was provided by them to the eye; and as much may be said of many other things. But those who care for flowers should come and see for themselves. It is business which is avowedly carried on here, but I should have taken it for pleasure if I had been left only to myself. *H. E.*

M. BRASSEUR'S NEW BOILER.—My attention has been called to a description in the *Gardeners' Chronicle* of a patent for heating hot water by M. Brasseur. There are so many good boilers by various makers in England that I think it hardly possible now to produce better. The boiler in question may be very good, but the information that is given requires to be extended before any opinion can be formed about it. For instance, the length, width, and height of the houses where it has been tried; also the size of the pipes; also whether the houses are half sunk in the ground, well sheltered or otherwise; the amount of heat kept up, &c. The true test of a boiler is the number of pounds of water it will evaporate in a given number of hours with a weighed quantity of coal. *Robert Warner.*

SMUT (USTILAGO SEGETUM) IN OATS AND BARLEY.—The communication on this subject which appeared in the *Gardeners' Chronicle* of last week was from my friend Mr. J. L. Jensen, of Copenhagen. Owing to inadvertance his name does not appear anywhere in it, and it is attributed to me. I much regret this, and hasten to make the present correction. I have since received a much longer and more detailed

communication on the same subject from Mr. Jensen, in which he gives me particulars of his experiments and investigations on the experimental farm of the Royal Agricultural School, Copenhagen. *Charles B. Plowright, 7, King Street, King's Lynn.*

EREMURUS HIMALAICUS.—In reference to your answers to correspondents *re Eremurus himalaicus*, I can quite bear out my friend, John J. Smyth's (the introducer of this fine plant into European gardens) assertion that your woodcut is not an accurate representation of the flower-spike, being too globular in form [The illustration represents a long cone!] The plant from which your woodcut was done was sent by me to our late lamented friend, the floral priest, Crewe, and does not vary in form. Mr. Crewe's plant now belongs to Mr. E. J. Loder, of Floore, Weedon. *W. E. Gumbleton.*

SINGLE DAFFODILS TURNING DOUBLE.—Without fear of contradiction I may say that no one in the kingdom has worked harder than I have to prove the truth of the prevalent popular belief, that the typical small single wild Daffodil will, under certain conditions of soil and cultivation, become transformed into the large double garden Daffodil (see p. 564). During the last fifteen years I have planted thousands of these single wild Daffodils in every available situation, and in every combination of soils, with every variety of manure, or without any. I have obtained them from very many sources, especially wild beds, from which it was asserted that they had, when transplanted, been converted to Daffodils with large double flowers. These converted bulbs have also been sent to me by several correspondents, but when planted in my garden, both the singles and the doubles persistently continue the same as when first planted. Sometimes if I plant them in poor soil, and in a sunless situation double Daffodils gradually become single; but these same bulbs, when put into sunny spots and rich soil, become double again, but in all cases *Telamodium* remains *Telamodium*, and the typical wild Daffodil retains its relative size and colour. Five years ago I found the belief I have mentioned so prevalent that I made an offer through the gardening journals to supply all believers in the change with a sufficient number of single wild Daffodils to make an experiment. I supplied them to about forty gardens in different parts of the kingdom, adding strict instructions as to isolation, and an exhortation to watch their progress every year; and to send me the first double flower produced by them. Out of thousands of bulbs I sent not one double flower has yet been returned to me. Many of those to whom I sent bulbs have corresponded with me. In some gardens my bulbs died out rapidly; in others they deteriorated, producing only one or two shabby single flowers; in others they are healthy, but continue single wild Daffodils. I have suggested that the transformed and doubled bulbs should be planted again amongst the single in the field from which they were supposed to have come; but, strange to say, when this is done, the doubles refuse to descend again to their former state, but continue amongst their single relations to produce large double flowers; and this seems the most remarkable part of the transformation. Though two years magnifies these little wild Daffodils into large double *Telamodium*, ten or twenty years will not change *Telamodium* under reversed conditions into single typical wild Daffodils; but the single and the double clumps remain side by side for a generation. I would not think of calling in question the good faith or the intelligence of any observers who record their experience about this, but the above facts are from my own observation. *C. Wolley Dod, Elye Hall, Malpas.*

THE CROWN IMPERIAL.—I was much surprised in reading in this paper some short time since a remark made by your very able correspondent, Mr. Wolley Dod, that his did not flower—I think he said—at all. I cannot imagine the reason of such being the case, unless his plants are cut off before they are ripe, which I believe is a great mistake. When they begin to decay they do look rather unsightly, but it would be better to have an unsightly object for a short time and have a good show of flower-heads in return, if that should be the cause of some plants not having any flowers; but still that may not be the reason for some not flowering. Now, mine are quite different to those of your correspondent. I have a row with, as near as I could count them, 150 heads of bloom, and from 3 to 4 feet high, and some of the heads 7 inches in diameter; another with about ninety-six, and one more with over sixty,

and some of the roots are quite on the top of the soil. They have not been transplanted for years, although they much need it now, as they stand too much crowded together, but generally after they are ripe I plant some other kind of things round about them, it may be annual flower seeds, or, sometimes, Radishes or Cabbage seed. There are three or four kinds of them, but yellow, and reds, grown together mixed, are I think this year much finer than I ever remember to have seen them. In the autumn I give them three or four buckets full of good strong manure-water out of the yard two or three times, and that gives them strength to stand up strong and firm against the wind, and produce a better head of flowers. I was very sorry to hear the gentleman was so unsuccessful with them, and hope he may be rewarded with better results than he has hitherto obtained with this noble flower. *J. S. C.*

WHINHAM'S INDUSTRY GOOSEBERRY.—This variety, which originated in Northumberland, is fast becoming a favourite, as will be seen from the following figures:—One firm in the North of England, sold in the years 1886, 1887, and 1888, a total of 183,000 bushes. This amount, we believe, is unprecedented in the trade. Large quantities have been shipped to many of the temperate parts of the world. The yearly increasing demand for this variety is ample proof of its sterling merits. It is an enormous cropper, and since its introduction there is no season in which the crops have been known to fail. The berry swells to a large size at an early date; hence it is ready for marketing quite three weeks' earlier than any other variety, and consequently it commands the highest market prices. When ripe the colour of the berry is dark dusky red, and no Gooseberry is better suited for jam making. The habit of the variety is good and vigorous, and the fact that it comes into leaf some time before it flowers, and is thus protected from spring frosts, should not be lost sight of. *A.*

RAILWAY RATES OF TRANSIT.—Home fruit and vegetable growers who have been building hopes for some enforced alteration in the incidence of railway rates of transit of articles of food in their favour because of the adoption recently by the House of Lords of an amendment in support of the home grower, moved by Lord Jersey, to the Railway and Canal Traffic Bill, may find their hopes to be baseless. An important deputation from the town of Southampton recently waited upon the President of the Board of Trade for the purpose of pointing out the exceeding injury which might result to that as well as to other outports were the bill to pass as thus amended. The deputation was able to show that there are to this question three sides at least, for whilst the home growers desire an increase in the railway rates for the carriage of foreign articles, the consumer has an important interest in the matter, as increased rates mean restriction of trade and higher prices, whilst the seaport interests are concerned, lest higher charges for railway transit of all articles of food, which are produced at home also, may lead to the diversion of the traffic from outports to London direct per steamer. So that whilst the home grower would gain nothing the present important shipping interests at the outports might be ruined. We are here shown somewhat more forcibly than is usually seen in discussions respecting the incidence of foreign trade, how wide and deep have our trade interests become under Free Trade, and to touch anything avowedly in the interests of the home grower is to do some one or other incalculable harm. The home grower, who none the less may feel that he has the gravest cause for complaint, sees his own interests only, and cares little, of course, for those of the consumer or of the carrying trade interests—so great that, as Lord Salisbury told the Hlop growers the other day, it is impossible to deal with them in the matter of restriction without endangering the peace of the community. But the President of the Board of Trade was enabled to assure the Southampton deputation which waited upon him, that they, as well as everybody else apparently, had misunderstood the purport of the clause inserted in the bill by Lord Jersey, and that it would not affect seaborne goods. That is to say, that in the case of goods sent under similar conditions presumably from home stations no difference of rates may be made, but a difference may be made in the case of seaborne goods. This interpretation of the clause, whilst of comfort to the deputation, naturally gives little to the home grower, and shows how a coach and four may be driven through what is assumed to be

clear parliamentary drafting. Happily the bill has to pass the Grand Committee of Trade in the House of Commons, when the real interpretation of the clause, which seems to be of such mystifying character, will be fully given. It is extremely doubtful however, whether the clause, passed in the Lords by a very narrow majority and in opposition to the wishes of the Government, will not be removed in the Commons, where the measure will have to pass through a severe ordeal, and however it may prove unfair to home growers that railway charges should thus appear to favour foreign produce, it becomes evident that the apparent preference arises out of shipping competition, and if the railways will not carry at a low rate from outports, and thus ensure the traffic, the steamers will go to London direct, and thus greatly injure both the railways and the outports, whilst the home grower would really gain nothing, for to compensate for the loss of the foreign traffic, the railway companies would probably have to increase these charges for the transit of home produce to help recoup them for loss in the other direction. *Spade.*

WANTED A GARDENER.—I have been much interested in the articles that have appeared in the *Gardeners' Chronicle* under the above heading. It seems to me that the firms which advertise men in that way do so to the disadvantage of gardeners generally. Nurserymen by such advertisements lead employers to consider the market to be so overstocked that it is no wonder that wages are now so low. About the market being overstocked there can be no two opinions. Gardeners have themselves to thank for much of this state of things, the delight of some being in training as many young gardeners as they can find room for, instead of making more use of garden labourers. The Royal Horticultural Society would certainly do no harm in granting certificates to candidates who have successfully passed their examination, but heavy would be their work if there are so many young gardeners as your correspondent from Harroby would have us believe. There are, he also says, hundreds that would emigrate, and I think there is no reason to doubt his word. The successful candidates would consider they had a prior claim to any vacant situation, but I fail to see how they would justify their claim, and I am afraid employers would not consider their certificates of much importance, but would still prefer the man who would take a moderate wage. It is well known that some of the best men are not in the best places and that many of the most successful cultivators are filling very small places. An eloquent man, though an indifferent cultivator, seems to succeed the best, and I feel sure a Royal Horticultural Society's certificate would not impart eloquence to the candidate. Some gardeners seem to see brighter days in store, but I do not. Many years ago, when travelling was more difficult, the rich interested themselves in their establishments to a greater degree than now, for they spent the greater portion of their time at home. Now the case is quite reversed. It is an easy matter to run all over the world and enjoy all the interesting scenery, and in consequence very little interest is felt for the country home, and very little time spent there. I have been in gardening twenty years, in some of the best gardens in England, and have for five years held the position of head-gardener. I have (from no fault of my own) been out of a situation nearly twelve months, and cannot get so much as a day's employment from any nurserymen, not even from those with whom I have dealt when in place. I have, however, done my best to learn another business, and having secured premises, shall shortly start on my own account. I shall do my best to succeed, and I trust I shall be rewarded by seeing my business flourish, and, considering the present state of gardening: I would advise others, when out of place, to turn their attention to some other employment, and I sincerely wish them every success. *A Disgusted Gardener.*

DESTROYING WEEDS ON WALKS.—In response to "J. S." (p. 566), I beg to inform him I have used sulphuric acid very extensively on our walks and carriage drives, of which last-named there are about two miles. The quantity used was about one pint to a gallon of water, which was distributed with a watering-pot having a fine rose. The mixture is very effectual; so much so, that after a few seasons' use very few weeds grow where it has been applied. Great care is needed in its application, as it is very damaging to clothing and boots [and water-pots. *Ed.*] *J. M. Johnston, Hints Hall, Tamworth.*

SOCIETIES.

ROYAL HORTICULTURAL.

TUESDAY, MAY 8.—A large display of Daffodils by the nurserymen, and a few exhibits of a miscellaneous character, took place at the Drill Hall, James Street, on the above date, and the record of which is given under the heading of the several committees.

Scientific Committee.

Present: D. Morris, Esq., in the chair; and Messrs. Burbidge, Lynch, O'Brien, McLachlan, Pascoe, Michael, Smee, Ridley, G. Murray, Professor Scott, Professor Church, Dr. Hogg, and Dr. Masters.

This meeting was held in the new library, at 111, Victoria Street.

Mr. Lynch, of the Cambridge Botanic Garden, showed the following specimens:—

Eichornia tricolor.—A tropical aquatic plant from Pernambuco, where it was gathered by Mr. Ridley. The flowers are in erect terminal panicles, each of a rich blue colour, with a small yellow spot on the lower perianth-segment. Mr. Lynch had grown it in a pot submerged to the rim. A discussion ensued as to the culture of these beautiful plants, Mr. Burbidge narrating his method of inducing *Pothos* crassipes to flower. This he does by not allowing the plant to float but by placing it in a pot on a shelf fully exposed to light, and thus checking its wandering tendencies.

Chrysanthemum hematoma.—Mr. Lynch also showed flowers of this plant little if at all better than our common ox-eyed Daisy, though in its native country, as shown in the following extract from Lowe's *Flora of Madeira*, it must be a fine thing:—"In the island of Madeira a bush of this species on its native black or grey and barren crags—one mass of lovely rose-pink flowers, and conspicuous from afar like a Camellia or Rose bush—is a truly splendid and surprising sight."

Hypochaeris Leichtlinii.—A pretty yellow-flowered Composite, with the backs of the ray-flowers flushed with purplish-brown. It seems as if it would make a handsome bedding plant.

Pilocarpus pinnatifolius.—A Rutaceous plant, with dark green pinnate leaves, the segments broadly oblong. The plant is interesting as being the source of the drug Jaborandi, and of the substance known as pilocarpine.

Pentapterygium serpens.—A curious Vacciniaceous plant, from the Sikkim Himalaya, with angular tubular flowers of a bright red colour. The leaves are in two rows, small, ovate, and the stems which bear them spring from a very large woody tuberous growth. The plant grows upon the branches of trees.

Zinnia elegans.—A Mexican weed, shown to illustrate the vast advance that has been made in the culture of these plants, and the art of the florist.

Dipladenia boliviensis.—Young stems of this plant were shown, in order to show the herbaceous stipular outgrowths at the base of the leaf, and which are divided into narrow lobes in a palmate fashion. These, instead of falling off or drying up, become woody and may serve to aid the plant in climbing from tree to tree.

Dendrobium Quelchii.—Mr. Ridley exhibited a photograph of this North Australian Dendrobe, which is nearly allied to *D. bigibbum*, but is not yet in cultivation.

Monsteos Lolia purpurata.—Mr. Smee exhibited flowers of this species variously malformed. One had three anthers (A 1, a 1, a 2).

Odontoglossum retusum.—Mr. Bonney, Swanley, Kent, showed a plant of this rare species, remarkable for its orange-scarlet flowers. A Botanical Certificate was awarded.

Erythronium grandiflorum.—Mr. Loder sent a fine spike of this flower, with no fewer than fourteen flowers, most of them fully expanded. This is the finest specimen of this plant yet exhibited.

Lily Disease.—From Mr. L. Castle came leaves of *Lilium candidum* in a rotting condition, probably from the effects of a fungus (*Peronospora*). Mr. Geo. Murray undertook to report on the specimen.

Fir Branches and Squirrels.—The Editor of the *Scientific News* sent shoots of the common Spruce Fir gnawed off by squirrels, which seem specially destructive this season. The object of the animal in inflicting this injury is not obvious.

Malformed Cucumber Blossoms.—Messrs. Carter sent specimens of Cucumber flowers in which the calyx was leafy, and also showing other deformities,

which were referred to Dr. Masters, for further examination and report.

Iris Sari var., &c.—Professor Foster sent the bloom of an Iris which had been received from Nazareth, and which is said to grow wild there. In coloration it somewhat resembles *I. iberica*, but in essential features—rhizome, foliage, form of flower, &c.—it is more nearly allied to *I. Sari*. Subject to the results of further study, Professor Foster "would be inclined to call it provisionally *I. Sari var. Nazarena*; but I do not wish to name it definitely at present. The other smaller Irises, as *I. Saworowi* (Regel) and the one with beard on inner perianth segment, is what Regel described as *I. lineata* (Foster), but which is really only a variety of *I. Saworowi*."

Gentiana acacis.—Mr. G. F. Wilson showed flowers of this species with a curious spongy outgrowth from the outer surface of the corolla, on which Dr. Scott promised to report at another meeting.

Fertilisation of Tigridia and Hippeastrum.—A paper was read on this subject from Dr. Bonavia, in which he described how bees search for the nectar under each edge of the inner petals of *Tigridia*; but as they do not touch the stamens and pistil they must have discovered the concealed glands through scent, and so ride the flower, just as ants do, without pollinating it. *Hippeastrum* is fertilised by pollen-seeking bees or bee-like insects in India. One kind of bee balances itself on the wing opposite the tuft of anthers, and then, suddenly making a sort of somersault among them, brushes off the pollen with the hairs of its body, when the stigma gets dusted all over with pollen. A second kind, after balancing itself by a sudden movement brushes off the pollen with the hairs of its legs. Lastly, a third kind of bee settles on the anthers, scoops out and devours every grain of pollen. After alluding to the fact that some flies are also pollen-eaters, the author suggests that certain humming birds provided with feathers on their feet may possibly be the true fertilisers of *Hippeastrum* in its native country.

In the course of the discussion on this subject it was pointed out that humming-birds hover over the flowers and perforate them with their beaks, and hence that the tufts of feathers on the legs of some of the species are not likely to act as pollen-brushes. Mr. Morris related how in Jamaica the humming-birds, which at first had not attacked the flowers, suddenly began to split the tubes of the *Cinchona* flowers and thus ensured the fertilisation of the flower. Mr. Burbidge called attention to the fact, that in South America the Scarlet Runner does not set its fruit, but in this country it fruits freely owing to the bees, which bore through the base of the flower—a curious illustration of a foreign flower rendered fertile by the agency of British bees. The meeting then adjourned.

Floral Committee.

Present: G. F. Wilson, Esq., F.R.S., in the chair; and Messrs. H. Herbst, W. Bates, G. Duffield, T. Baines, G. Nicholson, C. T. Druey, R. Dean, C. Noble, H. Ballantyne, C. Pilcher, J. Dornay, H. M. Pollett, J. O'Brien, E. Hill, A. F. Lendy, B. Wynne, J. Fraser, W. Goldring, Dr. M. T. Masters, F.R.S., G. Paul, J. Walker, and Rev. W. Wilks.

A small collection of new varieties of *Amaryllis* was exhibited by Messrs. Kelway & Sons, Langport, the flowers being in all cases with either scarlet ground colour and white bars and stripes, or *vice versa*. A basketful of *Azalea indica*, in new varieties, together with a choice collection of seedling alpine *Auriculas* came from Mr. C. Turner, Slough. Of the former, *A. i. Vervaeneana*, a semi-double white flower, each petal being suffused with rose and striped with carmine, was considered worthy of a certificate; *A. i. Theodore Reimers* is a fine large double-flowered purple, but not so good as some others we have. In *Auriculas*, Mrs. H. Turner, with primrose paste dark purple edge, running out to a shade of lilac at the margin, a large smooth, regular-formed flower. Harry Turner has sulphur-yellow paste, a maroon ring shading off at the edge to a lighter tint, equally good with the first-named. Probably *A. Loveliness*, a very bright flower, would have received a Certificate had the truss been composed of pips of regular size.

From Messrs. Paul & Son, The Old Nurseries, Cheshunt, came a new Fairy China Rose—Red Pet—similar in colour to Fellenberg Noisette, but of dwarf, slender habit of growth; the new Rose, Lady Alice, carrying some fair blooms for its second crop; *Phillyrea decora*, Vilmorin's variety, a handsome evergreen shrub, with short spikes of creamy-

white flowers, and narrow dentate lanceolate leaves, free in growth, and said to be able to withstand smoke and fogs with impunity; *Prunus Pissardi*, *Acer Negundo aureo-marginata*, with pale greenish-yellow variegation, less effective than the white variegated form; a few flowering Moutan Peonies, and the *Azalea-like Rhododendron exoniensis*, a species with white flowers.

Mr. W. Paul, Waltham Cross, showed the new Tea Rose, Madame Hoste; it is creamy-white, with few petals, a nicely formed flower when half expanded.

A number of small well bloomed plants of *Olearia Gunni* were shown by Messrs. J. Veitch & Sons, Chelsea.

A grand lot of cut blooms of *Magnolia conspicua* were shown by Mr. J. Hudson, Gunnersbury House Gardens, Acton, and formed one of the most noticeable items of the whole show, the delicious fragrance and pure white colour of the flowers renders them very attractive, and the tree itself forms a delightful object when covered with its freely produced flowers, which are borne before the leaves.

Mr. J. H. Virgo, Walton-in-Gordano, Clevedon, showed two vigorous varieties of *Myosotis dissitiflora* with large blue flowers freely produced, but the two forms as shown are not sufficiently distinct to justify their being named.

Certificates were awarded to Mr. R. Dean, Ealing, for a very pretty new decorative *Polyanthus Primrose* named John Woodbridge; the flowers were rich port-wine colour with a prominent yellow eye; and for a white-centered alpine *Auricula* Hetty Dean; the corolla lobes were white at the extreme margin, with an intense purple-mauve spot in the centre, the colour of which faded to the white of the margin—a bright attractive flower. The same exhibitor also showed a pretty pure white form of *Primula Sieboldi*, named Snowflake; the corolla was finely crested, and gave a very capital effect; and a useful dwarf, compact, bright yellow *Wallflower*, Bedford Yellow, which has been exhibited in former years.

Two interesting specimens were shown by Mr. F. Ross, Pendell Court Gardens, Bletchingley—*Cantua dependens*, the long tubular flowers with bright rose lobes and orange-yellow tubes are very bright and pleasing; the other plant was *Callistemon salignus*, with flowers of pale yellow, not so showy as the crimson-flowered species, but still ornamental.

Roses (cut) were shown in fairly numerous quantities; Mr. J. Walker, Thame, Oxon, had two boxes of one each of *Maréchal Niel* and of *Niphetos*, the flowers being remarkable for their large size, fully deserving the award made—a Silver Banksian Medal.

Mr. W. Bennett, Shepperton, Middlesex, received similar recognition; also for an exhibit of cut Roses; he showed four boxes of *Lady Mary Fitzwilliam*, which made a capital display; there were also *Princess Beatrice* and a *Polyantha* variety, named *Little Dot*—all excellent samples, especially *Lady Mary*.

Mr. W. Rumsey, Waltham Cross, N., contributed a collection of cut Roses, embracing several popular varieties, among which were included *Maréchal Niel*, *Souvenir d'Ami*, *Madame de Watteville*, *Niphetos*, *Etoile de Lyon*, *Madame Margottin*, *Souvenir d'Elise Vardon*, *Catherine Mermet*, and the *Polyantha* forms *Mignonette* and *Paquerette*; and in this instance a Silver Banksian Medal was again awarded.

Messrs. H. Cannell & Sons, Swanley, Kent, showed a handsome hybrid *Calceolaria Souvenir*, of which *aurea florabunda* was probably one of the parents; it is of a tall habit, compact, and produces very freely its clusters of bright yellow flowers, just the sort of plant to make a grand appearance in a border if it prove hardy. A new seedling *Coleus* was sent by Mr. W. Seaman, gr. to G. Biggs, Esq., Westbury, Brentwood, a highly-chequered and brightly-coloured form. A hybrid *Primula* was shown by Mr. W. T. Thompson, Tavern Street, Ipswich; the foliage was glaucous, dark green, and the purplish-lake flowers borne in an umbel. Pots of *Mignonette* were sent by Mr. C. Smith, Brighton; and Messrs. G. Bunyard & Co., Maidstone, showed *Deutzia*, *Pride of Rochester*, a variety of *crinata*, with large double flowers of pure white.

Daffodils were again numerous, Messrs. Barr & Son, Covent Garden, W. C., and Mr. T. S. Ware, Tottenham, N., each occupying an entire side of the hall, and to each exhibitor a Silver-gilt Banksian Medal was awarded. Messrs. Barr were also awarded two Certificates for new Daffodils, viz., *N. incomparabilis Gloria Mundi*, with broad, flat,

bright yellow perianth segments, and a corona of about one-half the length of the segments, wide at the top, rich orange shaded to a paler hue at the base, the margin frilled; the other variety was *N. bicolor Mrs. J. B. M. Camm*, very pale sulphur-yellow, almost white throughout; the perianth segments twisted. Of other specially noticeable varieties shown, mention may be made of the following:—*maximus*, *Sir Watkin*, *Poeticus*, *Lady Seymour*, *Leedsii*, *Beatrice*, *Mrs. Langtry*, *Katherine Spurrell*, *Beauty*, and *H. E. Buxton*. Messrs. Barr also showed *Fritillarias*, *Mexican Anemones*, *Trilliums*, arranged with the Daffodils.

In Mr. Ware's exhibit somewhat similar varieties were to be seen and of equal merit, but most noticeable were *Captain Nelson*, *Horsfieldi*, *Poeticus*, *Leedsii* and its vars., *odorus minor* and *grandis*. He also showed a few hardy plants such as *Gentiana verna* (a charming plant), *Cypripedium macranthum*, *Primula Sieboldi grandiflora*, and *Anemone apennina alba*, a pure white flower; and *Polemonium confertum*, with blue flowers—a very dwarf plant, and remarkably pretty. Certificates were awarded for both these.

Orchids.—A pretty collection of *Cypripediums*, and a few other *Orchids*, &c., was shown by Mr. B. S. Williams, Victoria and Paradise Nurseries, Holloway; the former consisting of *C. Boxalli* and the sulphur-yellow form of it, *C. B. aureum*; *C. selligerum*, and the improvement on it, *C. s. majus*, which has much darker tints, and is larger than the type; *C. grande*, a fine plant of large growth, and one spike, which carried two or three flowers; *C. Dayanum*, the much lasting *Druryi*, and others. The *Lycaste cochleata*, with yellow flowers, whose petals and sepals are curiously twisted; *Oncidium sarcodes superbum*, in which the lip is almost wholly of a yellow colour; an *Amaryllis*, and a fine *Clivia*, concluded the exhibit. A Silver Banksian Medal was awarded.

Mr. Lawrence, gr. to D. Knox, Esq., 17, Gloucester Place, Portman Square, showed *Oncidium curtum* *Gardnerianum*, which differs from the type in the lip, which has its margin less densely spotted with brown, and also in the looser panicle of blooms. *Odontoglossum Ruckerianum*: a one-spiked plant of this very handsome species, came from the same exhibitor.

Mr. Cummins, gr. to A. H. Smee, Esq., The Grange, Wallington, showed a specimen of *Odontoglossum Marriotianum*, which had been grown in the open air there during the season 1887, and which had produced two well-developed spikes, one with thirteen, and the other with eighteen blooms; *O. crinitum saphiratum*, a small flowered species, and one in which the lip is the largest developed part of the flower. It is white, three-quarters of an inch in width, with three acute tailed lobes, and mauve spots. The rest of the flower is greenish-brown.

Poe's variety of *Odontoglossum Pescatorei* came from the garden of J. T. Poe, Riverstone, Nenagh. In this variety the broad white petals and sepals are covered with a suffusion of light rose and purplish-brown flakes irregularly distributed.

Cattleya Lawrenceana *delicata*, a flower of a lilac-purple hue, and throat white, came from H. J. Buchan, Esq., Wilton House; and *Odontoglossum ciriosum* from Mr. P. Blair, Trentham.

FIRST-CLASS CERTIFICATES.

- To *Anemone apennina alba*, from Mr. T. S. Ware.
- To *Polemonium confertum*, from Mr. T. S. Ware.
- To *Narcissus incomparabilis Gloria Mundi*, from Messrs. Barr & Son.
- To *Narcissus bicolor Mrs. J. B. M. Camm*, from Messrs. Barr & Son.
- To *Rose (Tea) Madame Hoste*, from Messrs. W. Paul & Son.
- To *Azalea Vervaeneana*, from Mr. C. Turner.
- To *Auricula (alpine) Harry Turner*, from Mr. C. Turner.
- To *Auricula (alpine) Mrs. Harry Turner*, from Mr. C. Turner.
- To *Polyanthus John Woolbridge*, from Mr. R. Dean.
- To *Auricula (alpine) Hetty Dean*, from Mr. R. Dean.
- To *Phillyrea decora Vilmoriniana* (as a plant suited to smoky districts), from Messrs. Paul & Son.

Fruit Committee.

Present: H. Veitch, Esq., in the chair; and Messrs. J. Lee, J. Cheal, G. W. Cummins, C. A. Ross, C. Howe, W. Marshall, J. Wright, J. Smith, R. D. Blackmore, and Harrison Weir.

This committee had but little on which to adju-

dicare; the exhibits consisted of a brace of Cucumbers, Sutton's Improved Telegraph, and a dish of good Asparagus from Mr. Palmer, gr. to W. F. Hume Dick, Esq., Thames Ditton House; a seedling Apple, Barron's A 1, from Messrs. W. Barron & Son, Elvaston, Derby; a collection of Rhubarbs from the Society's garden; a boxful of President Strawberry; and some well preserved Lady Downe's seedling Grapes, cut on January 2 from the garden of H. H. Gibbs, Esq., Aldenham House, Elstree (gr., Mr. Beckett).

Narcissus Committee.

A meeting of the Narcissus Committee was held in the Drill Hall on Tuesday, when a number of specimens from different sources was considered and reported on.

The following varieties were registered:—Incomparabilis Queen Bess, which is somewhat similar to Princess Mary in form, but with pure yellow crown, and probably the first to bloom of this section in some gardens, being always in advance of what is known as Stella; Maurice Vilmorin, and a variety of Burbidge named Pet. C. R. *Serasse Dickinson, Hon. Sec.*

THE SCOTTISH PRIMULA AND AURICULA.

This Society held its second show in the Calton Convening Rooms, Edinburgh, on the 9th inst. The retarding character of the weather recently was shown in the backward condition of the blooms, there being very few that might be described as fully up to the exhibition standard in respect of expansion; yet there was a freshness and substance about the majority of the exhibits that was extremely pleasing. Competition was more keen and close than last year, and the number of competitors was more than doubled. They came from Newcastle, Leek, Staffordshire, Ayr, Perth, Dundee, and the districts surrounding Edinburgh, so that the Auricula growers of the country were fairly represented. Some improvement in the handling and setting up of the flowers was observable on last year's exhibits, but especially in the matter of thinning the trusses, and the efforts of northern exhibitors tend to further improvement in the flower. This was noticeable when the majority of the latter exhibits were compared with the finished plants staged by Mr. Ben Simonite. These were undoubtedly the feature of the show as regards show Auriculas. The latter were the more numerous, alpine being sparingly shown for competition.

For six show Auriculas Mr. W. H. White, Newcastle, carried the 1st prize, with a splendid Prince of Greens, Ajax, Frank Simonite, Conservative, Beauty, and Mr. Douglas. The Prince of Greens in this lot also was awarded the prize for the premier green edge in the show. Mr. Kerr, Douglasfield, Broughtyferrie, Dundee, took 2nd prize, with a lot which would have attained a better position a week later; Mr. William Marshall, Ayr, was 3rd with a good set. Mr. E. Adams, Swallow, Newcastle, took the 1st place in the class of four stage varieties, his lot consisting of Lovely Ann, George Lightbody, Meteor Flag, and Acme; Mr. J. Black, East Calder, was a close 2nd; and Mr. W. H. White, 3d.

Space will not admit of following the schedule in detail, but the exhibitors already named figured in nearly every class of stage varieties, Mr. Kilgour, Blair Adam; Mr. Bairnfather, Leek, Staffordshire; Mr. Scott, Forgan, and others, dividing honours with them.

The prizes for premier stage varieties, other than the green-edge Auriculas already mentioned, were taken by Mr. Kerr, for grey-edged Alderman Wisbey; by Mr. E. A. Adams, for white Acme; and by Mr. Kerr, for self Topsy.

Polyanthus Primroses and Primula obconica were fairly represented and closely competed for. In the class of three distinct species Mr. Straton, the Secretary of the Society was the only exhibitor, and staged fine samples of *P. denticulata*, *P. viscosa*, and *P. Auricula*.

A very interesting collection of Primulaceae from the Royal Botanic Gardens, Edinburgh, proved a most attractive feature of the show.

Mr. Calder, sculptor, Bellona, exhibited a number of his seedling forms of *P. viscosa* and *P. ciliata*, which were much admired.

Messrs. Laird & Sons set up an excellent and varied collection of Auriculas and Polyanthus; and Messrs. Dicksons & Co., a fine collection of Auriculas.

One end of the hall was decorated by Messrs. Jas.

Dickson & Son with Rhododendrons, &c. The President, R. Cathcart, Esq., Pitcarlie, and W. B. Boyd, Esq., Faldonside, Melrose, sent excellent exhibits of stage Auriculas.

The special prize of a Gold Medallion, presented by Mr. W. Straton, Secretary of the Society, for six self show Auriculas, was taken by Mr. J. D. Kerr.

A fine lot of blooms, including some very promising seedlings, were exhibited by the Rev. F. I. Horner.

COLONIAL NOTES.

THE NATIVE FLOWERS OF NEW ZEALAND.

Mrs. CHAS. HETLEY is about to bring out, through Messrs. Sampson Low, Marston & Co., a series of coloured illustrations of New Zealand plants. Judging from the sample before us, the publication will be very serviceable, for while the book is pretty enough for the drawing-room table, it has the more solid qualities of botanical accuracy and artistic design. Rarely indeed have we seen plants rendered with greater truth to Nature, the perspective and light and shade being admirably managed, while the outline and the arrangement of the several parts are such as to satisfy the requirements of a botanist. The plants are correctly named. The text would be improved by a little more amplification.

COCO-NUT PALM.

Coco-nuts are exported from the West Indies to the extent of £50,000 annually (3,000,000 nuts). Any disease in so valuable a tree is therefore a matter of much moment. In the *Bulletin* of the Jamaica Botanical Department we find that the two principal enemies are the Coco-beetle, which attacks the trunk and the terminal bud, or "cabbage," and the coccos or scale. The best cure for the beetle is a handful of salt, or unslaked lime, dusted into the centre of the bud where the beetle is at work; but this remedy can only be applied when the Palm is young. The scale insect is a more serious pest. The remedy proposed is to place burning leaves, or other rubbish, at the base of the stem in such a way that dense smoke without flame is produced, the smoke penetrating amid the leaves of the Palm and killing the insect.

NATAL BOTANIC GARDEN.

According to Mr. Medley Wood's interesting report for the year 1887, drought was as pronounced at Durban as in the home country, although the total rainfall is given at 31 inches. The temperature, is, however, much higher, the mean maximum for the year being given as 80°, the mean minimum as 60°. To protect Roses from the attacks of white ants, the shrubs were planted in large earthenware tubs sunk in the ground like drainpipes. The plan so far has been successful. A list of native plants occurring within 5 miles of Durban is given as an appendix to this unusually interesting report.

BOTANIC GARDENS, CAPE TOWN.

The annual report is discouraging; wholly insufficient means, want of interest on the part of the authorities, dilapidated structures, deficient water supply in the hot season—these are a few of the obstacles the Director has to contend with. As a compensation the newly instituted Agricultural Department will relieve the Director of much time and labour, now expended in replying to enquiries about cultural matters in all parts of South Africa.

THE WEATHER.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING MAY 19. (AVERAGE OF FORTY-FOUR YEARS.)

THE PAST WEEK.

The following summary record of the weather for the week ending May 7, is furnished from the Meteorological Office:—

"The weather has been somewhat changeable and unsettled in the western and northern parts of the kingdom, with frequent falls of rain, but over the greater part of England the conditions have been finer and the rainfall slight. At the close of the period much fog was experienced over the St. George's, Bristol, and English Channels.

"The temperature has continued below the mean generally, the deficit ranging from 1° to 3°. In 'Scotland, E.' and 'England, N.E.' however, an excess of 1° is shown. Towards the end of the week the thermometer became high for the season in the eastern parts of Scotland and over eastern and central England, but remained low on our south and south-west coasts. The highest of the maxima, which were recorded on the 7th, ranged from 60° in 'Scotland, W.' and the 'Channel Islands,' to 69° in 'England, W.' and 'England, S.' and 'Ireland, S.' 70° in 'Scot-

land, E., and 72° in 'England, E.,' and the 'Midland Counties.' The lowest of the maxima were registered at most stations either on the 4th or 5th, when the readings varied from 31° in 'Ireland, N.,' to 38° in 'England, N.E.,' and 42° in the 'Channel Islands.'

"The rainfall has been rather more than the mean over Ireland and the greater part of Scotland, as well as in 'England, N.W.,' but less over eastern, southern, and central England.

"Bright sunshine has been rather less prevalent than it was last week in the Scotch districts, but more so over England and Ireland. The percentage of the possible amount of duration ranged from 26 in 'England, N.W.,' to 40 in 'England, N.E.,' 41 in 'Ireland, S.,' and 51 in the 'Channel Islands.'"

DIED, on May 1, GEORGE VENNOR, aged sixty-four; for thirty-two years the faithful and attached servant and Head Gardener to Mrs. Buchan, The Grove, Hanwell.

MARKETS.

COVENT GARDEN, May 10.

A STEADY business doing all the week, with good supplies. Large quantities of vegetables from the Continent at low prices. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES. s. d. s. d. * Orchid bloom in great variety, but the demand not very good.

SEEDS.

LONDON: May 9.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report that a quiet feeling is now beginning to pervade the seed trade. Sowing orders for Clover and other seeds still come to hand, which are executed at the extremely low prices now current. Stocks all round are quite moderate, so that an early speculative inquiry appears probable. Spring Tares continue in short supply, and some quantity yet will still be wanted. In Rape seed the

tendency continues upwards. Mustard is cheap and abundant. There is no change in Hemp or Canary seed. Blue Peas are exceedingly firm. Feeding Linseed is dull.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended May 5:—Wheat, 31s. 2d.; Barley, 30s. 6d.; Oats, 16s. 4d. For the corresponding week in 1887:—Wheat, 33s. 2d.; Barley, 23s. 2d.; Oats, 16s.

FRUIT AND VEGETABLES.

SPITALFIELDS AND COLUMBIA: May 9.—Good supplies of all kinds of fresh vegetables. Prices moderate; demand fair. Potato trade quiet, except for superior kinds. Quotations:—Asparagus, 2s. 6d. to 4s. 6d. per sack; Cauliflowers, 2s. 6d. to 7s. 6d. per tally; Broccoli, 3s. to 3s. 6d. per bushel; Spinach, 1s. to 1s. 6d. per sieve; Turnip-tops, 1s. to 1s. 6d. per sack; Greens, 5s. to 7s. per dozen bunches; Turnips, 1s. 6d. to 2s. do.; Carrots, 2s. to 3s. do.; Parsley, 1s. 6d. to 2s. do.; Mint, 1s. 6d. to 2s. do.; spring Onions, 2s. to 3s. do.; Radishes, 1s. to 1s. 6d. do.; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Rhubarb, 1s. 6d. to 2s. 6d. per dozen bundles; Horseradish, 10d. to 1s. 2d. per bundle; Beetroots, 8d. to 1s. per dozen; Endive, 10d. to 1s. 3d. do.; Cabbage Lettuces, 8d. to 10d. do.; English Onions, 7s. to 8s. per cwt.; foreign Onions, 5s. to 7s. per bag of 110 lb.; Carrots, 4s. to 100s. per ton; Swedes, 28s. to 30s. do.; English Apples, 4s. 6d. to 9s. per bushel; American Apples, 14s. to 22s. per barrel.

STRAFORD: May 8.—Both trade and supply have been good. Quotations:—Cauliflowers, 3s. to 4s. per dozen; Carrots, household, 60s. to 80s. per ton; do., cattle feeding, 25s. to 30s. do.; Mangels, 19s. to 22s. do.; Onions, Egyptian, 6s. 6d. to 8s. per bag; Apples, English, 3s. to 7s. per bushel; do.; American, 18s. to 25s. per barrel; Watercress, 6d. to 8d. per dozen bunches; Apples, 13s. to 15s. 6d. per half-cask; spring Onions, 4s. to 5s. per dozen bunches; Radishes, 1s. to 1s. 2d. do.; Beets, 7d. per score; Asparagus, 2s. to 3s. 6d. per bunch; Wallflowers, 3s. to 4s. per dozen bunches; Lettuce, 1s. 4d. to 1s. 6d. per dozen; Cucumbers, 2s. to 6s. do.; Broccoli, 2s. to 3s. per bushel; Rhubarb, 1s. to 2s. per dozen bunches; Spinach, 2s. to 2s. 6d. per bushel; Parsley, 2s. to 4s. per dozen bunches.

POTATOS.

BOROUGH AND SPITALFIELDS: May 8.—Old Potatoes come on offer in larger supply than required, and prices are drooping. Many new Potatoes are arriving, but not in sufficient quantity to quote. Quotations:—Regents, 100s. to 115s.; Magnum Bonums, 50s. to 90s.; Dunbar, 100s. to 110s.; Champions, 45s. to 110s.; Dutch Rocks, 55s. to 100s. per ton.

SPITALFIELDS AND COLUMBIA: May 9.—Quotations:—New Potatoes: Malta kidneys, 10s. to 14s.; Malta rounds, 9s. to 11s. per cwt. Old Potatoes: Regents, 60s. to 100s.; Regents, 60s. to 80s.; Imperators, 50s. to 90s.; Magnums, 40s. to 80s.; Victorias, 50s. to 65s.; and Champions, 50s. to 60s. per ton.

STRAFORD: May 8.—Quotations:—Scotch Magnums, 80s. to 90s.; Regents, 80s. to 85s.; lightland, English, 50s. to 80s.; blackland, do., 45s. to 55s. per ton. New: 8s. to 12s. per case.

Imports.—The imports into London last week consisted of 8772 bags from Hamburg, 60 from Calais, 200 from Bremen, 14,607 packages and 111 cases from Malta, 5 boxes from Adelaide, and 22 sacks from Stettin.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 86s. to 104s.; inferior, 80s. to 84s.; hay, prime, 84s. to 100s.; inferior, 75s. to 80s.; and straw, 38s. to 47s. per load.

NOTICES TO CORRESPONDENTS.

ADDENDUM: SCOTTISH BOTANICAL ASSOCIATION.—Our reporter omitted to state that Mr. Kidd, the winner of the certificate for Dendrobiums (see p. 563 in our last issue) is head gardener to Brooman White, Esq., Ardaraock, Garelochhead.

BOUSSINGAULTIA: A. Packenham. Plant in a well enriched sandy loam, in a thoroughly drained and warm situation. B. Lachanmei (with pink flowers) requires stove treatment. You were answered in our issue for December 17, 1887, p. 762.

CATTLEA WEEVIL: O. E. H. The insect breeds in hothouses in this country.

CAULIFLOWER FOR EARLY SUPPLY: Peach. Early Dwarf Erfurt is very early, and has small compact heads; and Early London, a taller, more vigorous plant, and well flavoured.

DAFFODIL SPORT: St. Bridget. Many thanks; not uncommon.

FINE ASPARAGUS IN FRANCE: E. W. The superiority is due partly to climate, but more to deep soil, wide space between the plants, and other items of cultivation. At some places sewage is run over the beds by means of irrigation canals.

FLOWERING OF VANILLA AROMATICA: C. P. No, it is not uncommon.

INSECT: Cynipe. The insect had taken himself off.

LANTANAS: W. E. G. We were not aware that the trial occurred so long since. The communication in question reached us two or three months ago only without such intimation.

MELONS RIPENING: F. F. About twelve weeks from sowing to cutting during the summer; some early varieties require less time.

MUSHROOM ONE OR ANOTHER: B. P. Common, and often figured. The cause is not known.

NAMES OF PLANTS: P. C. Ornithogalum nutans.—J. B. 1. Amygdalus nana; 2. Populus monilifera; 3. Abies Douglasii; 4. Cupressus Lawsoniana var.; 5. R-tiospora squarrosa; 6. Abies Douglasii.—H. P. 1. Certainly not Tarragon, but we cannot say what it is; 2. Acer monspessulanum.—D. W. G. Dendrobium chrysanthum; Polystichum angulare proliferum.—W. Sundry. Dendrobium Wardianum.—M. L. D. Brassia maculata.—A. W. 1. Sanguinaria canadensis; 2. Pholidota imbricata; 3, next week.

PEACH LEAVES: Howd Garden etc. The appearance is due to the sun acting on drops of water, and converting them into so many burning-glasses.

POPLARS: T. D. Cuttings of 18 inches in length put into sandy soil, in a sheltered position in October, or layering in late summer.

PURPLE VISCAS: A. D. W. V. minor atropurpurea and V. m. multiplex have purple flowers.

COMMUNICATIONS RECEIVED.—E. Vertraet et Cie.—E. B.—W. R.—E. P. Ghent.—E. R. Ghent.—H. J. G.—M. Naudin Antibes (many thanks)—E. V. de V.—G. S.—W. E. G.—G. F. W.—E. G. L.—Messrs. Curtis & Co.—Ed. Sc. News.—L. C.—C. V. Ghent.—C. J. E. J.—W. B. G.—C. B. P.—R. McL.—Rev. G. H.—J. W.—H. L. & Co.—J. R. B.—J. D. & Sons.—W. B. H. (many thanks, but we cannot accept your obliging offer)—W. R.—W. C. B.—E. J.—T. R.—H. M.—R. D.—H. Low & Co.—W. B. H.—J. R. J.—W. S.—J. A.—J. D.—C. R. H. (next week)—J. B. T. (next week)—C. W.—W. S.—W. S. & Son.—W. B.—A. H.—W. W.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

THE "NEW EASY" LAWN MOWER.

Has an Open Steel Roller.

A man can work a 24-inch machine, cutting Grass 5 inches high clean to roots.

There is no easier working, no better finished, no stronger, no more durable mower in the market.

The Front Roller, with simple adjustment, enables the machine to cut very close to the ground, and to do fine work.

The machine will also cut verges.

To be obtained through all the leading Ironmongers or Seed-men, or from the Sole Licensees—

SELIG, SONNENTHAL & CO.,

GARDENING APPOINTMENTS.

MR. ARCHIBALD BAXTER, late General Foreman at Wentworth House, Rotherham, has been appointed Head Gardener at Sprotborough Hall, Yorkshire.

MR. H. STARK, Foreman for the last four years at Stoke Edith Gardens, Hereford, has been appointed Gardener to W. GARRAD, Esq., Kingswood Grange, Hockley Heath, Warwickshire.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

SCOTCH GARDENERS.

—JOHN DOWNIE (of the late firm of Downie & Laird), Seed-man, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Balliffs, &c.

JOHN LAING AND SONS, having filled many important places, can RECOMMEND with every confidence, energetic and practical MEN of tested ability and first-rate character. Ladies and Gentlemen in want of Gardeners and Balliffs, or Gardeners for first-rate establishments, or Single-handed situations, can be suited, and have full particulars by applying to us. No fees charged.—JOHN LAING AND SONS, The Nurseries, Forest Hill, S.E.

ORCHIDS.—A Man of first-class qualifications and character is at liberty to engage with a Gentleman to take charge of a Collection of Orchids, or combine that with the other duties of a Garden. He was a pupil of the late Mr. Spyers.—H. BURBERRY, Marks Tey, Essex.

To Nurserymen.

TO FOREMEN, &c.—A young man wants a situation under a Foreman. Private establishment. Age 21. Seven years' experience Indoors and Out. Good reference.—P. SOLMAN, The Gardens, Old Dalby Hall, Melton Mowbray.

SHOPMAN, with a good experience in the Seed, Plant, and Bulb Trade.—Good character.—CYANUS, 41, Wellington Street, Strand, W.C.

SHOPMAN (or SECOND, in a large House).—Good experience in general routine of trade, London and Provincial. Willing to assist in any Department. Part time in large London Warehouse. Highest references.—T. A., 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS.—Delicate Health.—In debility, languor, and nervousness, generated by excess of any kind, whether mental or physical, the effect of these Pills is in the highest degree tracing, renovating, and restoring. They drive from the system the morbid cause of disease, whether its origin be evident or its situation undiscernible; they re-establish the digestion, regulate all the secretions, quiet the nervous system, raise the patient's spirits, and bring back the frame to its pristine health and vigour. Holloway's Pills increase the appetite, while they secure perfect digestion to all ordinary food, and release the invalid from restraint in diet. In a word, whatever the cause of decline, the Pills place the patient in the position most favourable to recovery.

EDMUND ROBINS and HINE (of 5, Waterloo Place, Pall Mall) will SELL by AUCTION, at the Victoria Nursery, Beckenham, on MAY 25 and 26, valuable STOVE and GREENHOUSE PLANTS, including 3000 Maidenhair Ferns, 2000 Geraniums, 2500 Arum Lilies, 1500 Spiræas, 2000 Tuberoses, 100 Orchids, quantity of Heliotropes, Camellias, Gardenias, Aloes, Palms, Evergreens, and Bedding-out Plants, two VANS, GARDEN TOOLS, also the HOUSEHOLD FURNITURE, Bed and Sitting Room Suites, and a variety of useful effects.

Beckenham, Kent. To NURSERYMEN, FLORISTS, and CUT FLOWER GROWERS. The VALUABLE GROUND LEASE (57 years unexpired at only £18 per annum) of the Victoria Nurseries, Bromley Road, comprising a substantial Dwelling-house, 10 Large Glass and Forcing Houses, with heating appliances and every possible convenience for carrying on a lucrative Business. Standing in Nursery Grounds of 3 Acres. To be Sold, with possession, at the Mart by MESSRS. EDMUND ROBINS and HINE (of 5, Waterloo Place, Pall Mall), on JUNE 15, by order of the Mortgagees.

To Orchard Growers. The Magnificent Collection of ORCHIDS formed by the late T. A. Tittle, Esq., of Oakley House, Gledhow, Leeds. MESSRS. HEPPEL and SONS are instructed by the Executors to SELL by AUCTION in their Rooms, East Parade, Leeds, on WEDNESDAY and THURSDAY, May 30 and 31, commencing each day at 11 o'clock prompt, the COLLECTION of RARE and CHOICE ORCHIDS, amongst which may be mentioned a fine healthy lot of Cool-house ORCHIDS, including many hundreds of the fine Odontoglossum crispum, Pescatorei, large specimen Uroskianeri, extra fine plants of vexillarium var. rubellum and superbum, &c.; a very select and grand lot of Lycaste Skinneri, in extra strong plants; magnificent pans of Disa grandiflora, two specimens of the true Calogyne cristata hololeuca (alba); a grand lot of well-grown Cattleyas, in compact specimens, such as Mendelli, gigas, Dowiana, Gaskelliana, Mossie, Sanderaiana, &c.; a fine group of various Cypripediums, Anguloas; extra strong plants of the grand Dendrobium Wardianum, thyrsiflorum, deudisiorum, &c.; the rare Sobralia zantholeuca, and other choice things. The collection is in fine healthy condition, and most of the plants are in compact masses, suitable either for public exhibition or private decoration.

To Florists, Nurserymen, and Others. At a nominal reserve.—Lewisham, Kent, 10 minutes' walk from Station. COLLEGE PARK NURSERY, comprising nearly 3 acres, with 500 feet run of Glass (stocked with Camellias, Stephanotis, &c.), and an excellent Residence. Lease seventy years. Ground Rent, £35. MR. WM. HODSOLL will SELL by AUCTION, at the Auction Mart, E.C., on THURSDAY, May 31, the above DESIRABLE PROPERTY, with the Goodwill of the Business, by order of the Proprietor, who is relinquishing, owing to ill-health. The Nursery is within easy reach of Covent Garden, and in the heart of a good residential district, and an excellent opportunity is offered for the acquisition of a business of a pleasant and profitable character.

Langley, Bucks. ORCHARD and BUILDING LAND, with BRICK EARTH. MESSRS. BUCKLAND and SONS have received instructions to SELL by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on WEDNESDAY, June 6, 1888, at half-past 12 o'clock precisely, in lots, about 113 acres of most valuable FREEHOLD and COPYHOLD LAND, together with a Residence known as "South End Lodge," Farm Buildings, and Cottages, situate in the parish of Langley, Bucks, intersected by the Great Western Railway and the Grand Junction Canal, and abutting on capital roads. The Residence stands in the midst of Cherry Orchards of good growth and in full bearing, at only a short distance from the Langley and Slough Stations, and easily accessible for carriage by both railway and canal. The Land is also most suitable for Nursery Market Gardens and Seed Trial Grounds, and much of it contains Brick Earth of the best quality.

Particulars at the Mart; of Messrs. TAYLOR, HOARE and BOX, Solicitors, 28, Great James Street, Bedford Row, W.C.; and of the Auctioneers, 23, Hart Street, Bloomsbury Squares, W.C., and Windsor. £1000. To NURSERYMEN and GARDENERS.—Fifty-two years' LEASE, GOODWILL, &c., of SMALL NURSERY of 2 Acres, within 5 miles of Covent Garden. TO BE DISPOSED OF, with Six-roomed House, Six Glasshouses, Frames, Pitting and other Sheds, one Horse, Stable, and Coach-house, with portion of Stock. Rental, £50 per annum. £200 down, the remainder can be paid by yearly instalments at 4 per cent. Apply, in first instance, by letter only, Point Pleasant Nursery, Putney Bridge Road, S.W.

FOR SALE, a Small FLORIST BUSINESS, Four-roomed COTTAGE, Six GLASSHOUSES, large GARDEN Long Lease, at Low Rent. Apply to E. USMAN, Goldsworth Road, Woking Station.

TO BE SOLD, a well-established FLORIST'S BUSINESS, with lately-added Fruit and Greengrocery. Large Nursery covered with Glass. Good Jobbing Connections. Main Road in St. John's Wood. Principals only. Apply, GOWING AND CO., 41, Finsbury Pavement, E.C.

London, S.E.—Dissolution of Partnership.
TO BE SOLD, on advantageous terms, a compact NURSERY of 2 acres, with 7 Greenhouses, all heated, and 81 Frames. Lease, 7, 14, or 21 years. Rent, £120. Stock, £700, which can be greatly reduced by an auction. Apply to PROTHEROE and MORRIS, 67 and 68, Cheap-side, E.C.

Blunham, Bedfordshire.
 Seven Miles from the County Town, about One Mile from London and North-Western Railway Station, Blunham, and Two and a half Miles from Great Northern Railway Station, Sandy.

THE ORCHARD, a Gentleman's Compact Residence, situate in nicely-planted Grounds, comprising GARDEN, LAWN, and PADDOCKS, with pretty Carriage-drive and Entrance, with several enclosures of highly productive garden land, altogether about 50 acres, in a high state of cultivation. The House, which is on a gravel soil, contains Hall, Stairs, Drawing-room, 14 feet by 15 feet, 6 inches; Breakfast-parlour, 12 feet by 12 feet; Dining-room, 20 feet 6 inches by 15 feet; a Gentleman's Room, 8 feet by 10 feet 6 inches; large Store-room, well fitted; Kitchen, Scullery, Cellar, and Wash-house; Four principal Bedrooms, Servant's Bedroom, Closets, Dressing-room, Water-closet, and Back Stairs; there is a small Homestead, Two-stall Stables, Coach-house, and Loft over. The front Paddock is enclosed with Ornamental Timber, and the Garden is well planted, and includes a small Conservatory. Good Fishing may be had near, and the meets of the Oakley and Cambridgeshire Hounds are within an easy distance. The drives in the neighbourhood are pretty, and the roads very good. The Residence is within range of the celebrated Bedford Schools, which are available by cheap railway School tickets.

For Cards to View, Rent, Terms, &c., apply to Messrs. USHER and ANTHONY, Estate Agents, 9, St. Paul's Square, Bedford.

**TO LET, a NURSERY, in S.E. district, within 7 miles of Covent Garden Market, containing 5 acres of Land (walled in), 12 GREENHOUSES and PITTS. A good private trade can be done. Stock at valuation. For further particulars address
 A. A., 231, High Road, Lee, S.E.**

THE NATIONAL SEED AND NURSERY TRADE ASSOCIATION.

The ANNUAL GENERAL MEETING will be held in the "Waterloo Hotel," Edinburgh, on WEDNESDAY, June 6 next, at 5 o'clock afternoon, for the Election of Office-Bearers and the transaction of the Ordinary Business of the Association.

The ANNUAL DINNER will take place in the "Waterloo Hotel" on the same day, at 6 o'clock P.M.
DAVID HUNTER, S.S.C., Secretary.
 29, Dundas Street, Edinburgh.

TO THE SEED TRADE OF THE UNITED KINGDOM.

On the occasion of the ANNUAL MEETING of the NATIONAL SEED and NURSERY TRADE ASSOCIATION, to be held as announced in the foregoing advertisement, a MEETING of the SEED TRADE generally will be held in the "Waterloo Hotel," Edinburgh, on WEDNESDAY, June 6 next, at 3 o'clock P.M., for the purpose of considering the "Non-Warranty" clause used by the great majority of Wholesale Houses in connection with the sale of Seeds, of which the following is a copy:—

"Messrs. _____ give no warranty, express or implied, as to description, quality, productiveness, or any other matter of any Seeds they send out, and they will not be in any way responsible for the Crop. If the Purchaser does not accept the goods on these terms they are at once to be returned."

The Meeting will more especially consider the bearing of the said clause upon the Retail Trade, in view of recent legal decisions both in London and Edinburgh.

As the matter is of such vital importance to the Agricultural interests of the Country, a large meeting is requested.
DAVID HUNTER, S.S.C., Secretary.

THE GARDENERS' ORPHAN FUND.

DONATIONS and SUBSCRIPTIONS

WILL BE THANKFULLY RECEIVED BY
A. F. BARRON, Hon. Sec.,
 Royal Horticultural Society's Gardens, Chiswick, London, W.

Prices free.—4 and 5, Wormwood Street, E.C.

SPECIAL TO GARDENERS

Look on this Picture 

Past: Downright Hard Work.

And on that 

Present: Pleasure.

Why use the clumsy old-fashioned machines and work yourself to death, when by using the modern scientifically constructed labour saving implements, you can turn a tiresome task into a pleasant pastime?

The well-known merits and conceded superiority, combined with the enormous success of our Mowers in all parts of the civilised world, has caused numerous paltry imitations to appear. We would caution all Gardeners to insist upon having the genuine "EXCELSIOR," and to refuse all vile counterfeits, which always lead to disappointment. All our Mowers are made of the very best materials, are extremely simple in construction, and the adjustments are of the easiest possible form. They save an immense amount of labour, and make the Lawn as level as a billiard table. They have taken more FIRST PRIZES in open competition of recent date than all other Mowers combined. We are prepared to substantiate all the claims we make in open competition at any time.

"The 'Excelsior' is the best Lawn Mower."—*Field.*

"The 'Excelsior' performs its work perfectly."—*Journal of Horticulture.*

FIRST PRIZE

AMERICAN EXHIBITION,
1887.

"EXCELSIOR" LAWN MOWER

THE WINNER OF MORE FIRST PRIZES AND PREMIER AWARDS OF RECENT DATE THAN ALL OTHER LAWN MOWERS COMBINED.

Professional Gardeners prefer them because they save time and labour. Amateurs prefer them because they make the Lawn as level as a billiard table. Ladies prefer them because they can mow the Tennis Court themselves with ease. Children prefer them because they work so exceedingly easy.

ORCHID EXHIBITION.

One of the most beautiful sights in London.

ORCHIDS.—The Orchid Exhibition at Mr. WILLIAM BULL'S Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W., is open daily from 10 to 6 o'clock.

ORCHIDS.—A vision of loveliness unparalleled in Europe.

ORCHIDS.—"A scene of the greatest Orchidic beauty, baffling description, and defying exaggeration."

ORCHIDS.—The Exhibition is worth going any distance to see at Mr. WILLIAM BULL'S Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W.

NEW PLANTS FOR 1888

MR. WILLIAM BULL'S NEW CATALOGUE FOR 1888,

Now Ready, Price 1s.

Containing Names, Descriptions, and Prices of many beautiful New Plants offered for the first time.

WILLIAM BULL, F.L.S.,

Establishment for New and Rare Plants,

536, KING'S ROAD, CHELSEA, S.W.

NEW CHESHUNT ROSES for 1888.

Ready June 1, as good plants in pots.

PAUL & SON,

THE OLD NURSERIES, CHESHUNT,

ANNOUNCE AND RECOMMEND

H.P. LADY ALICE (Paul & Son), 10s. 6d. each.

First class Certificate Royal Horticultural Society, July, 1887, and Royal Botanic Society and Crystal Palace Spring Shows, 1885.

A beautiful companion to Lady Mary Fitzwilliam, but colour distinct, being of a creamy-white with light orange tinting—from the absence of pink a most desirable kind for forcing for cutting.

H.P. QUEEN OF AUTUMN (Paul & Son), 7s. 6d. each. A new, beautifully-shaped, late-flowering kind, of distinct crimson-lake colour.

Fairy China, RED PET (R. Parker), 3s. 6d. each, 30s. per dozen. A good crimson companion to White Pet.

The best New French Rose of the Spring, which have flowered here, at 30s. per dozen.

POLYANTHA—ROI DES POLYANTHES. First-class Certificate awarded to us for this Rose, Royal Hort. Soc.

T. MADAME HOSTE. First-class Certificate Royal Hort. Soc.

HYBRID RUGOSA MADAME GEO. BRUANT.

H.P. GLOIRE DE MARGOTTIN—the new red forcing Rose, And several other excellent Novelties.

THE NEW WHITE SOUVENIR DE MALMAISON.

Bourb.: KRONPRINZESSIN VICTORIA, 5s. each. A pure white with light lemon tint. Most distinct as seen here.

Descriptive CATALOGUE on application.

ROSES IN POTS;

all the best New and Old English and Foreign sorts, from 18s. to 36s. per dozen.

Descriptive List free on application.

RICHARD SMITH & CO.,

Nurserymen and Seed Merchants,
WORCESTER.

DANIELS BROS.,

Town Close Nurseries,

NORWICH.

Offer the following selection of Choice Florists' Flowers, all in strong, healthy, young plants, guaranteed true to name, and free at prices quoted:—

	Per doz.	s. d.
PELARGONIUMS, single-flowered Zonal all Autumn-struck, sturdy plants:—		
.. 12 new varieties of 1887 (Pearson's)	12	6
.. 6 " " " " " "	6	6
.. 3 " " " " " "	3	6
.. choice varieties from our grand collection, including the newest and most charming sorts in cultivation	4	6
.. double-flowered Zonal, splendid massive double flowers, of the most brilliant and beautiful colours:—		
.. 7 new varieties of 1887, magnificent, 12s. 6d.	5	0
.. very choice sorts, our selection	6	3s., 3s. for 1s. 6d.
.. double-flowered, Ivy-leaved, charmingly beautiful, free-flowering varieties, splendid for pot culture:—		
.. new and very choice sorts	4	6
.. 6 for 2s. 6d., 3 for 1s. 6d.		
ABUTILONS, choice named, 3 for 1s. 3d.	4	6
BOUVARDIAS, beautiful varieties to name, 6 for 2/6	4	0
COLEUS, all the most beautiful varieties, 6 for 2s.	3	6
.. (New) Princess Irene (Daniels) and Vesuvius (King), magnificent, each 1/6, the two 2/6		
CAMPANULA isophylla alba, splendid pot plant, each 6d., 3 for 1s. 3d.		
CHRYSANTHEMUMS, all the newest and most popular varieties in the Japanese, incurved, and Pompon sections, 6 for 1s. 6d.	2	6
DAHLIAS, Show and Fancy, a grand collection, our own selection, 6 for 2s. 6d., 3 for 1s. 6d.	4	6
.. Pompon, in splendid variety, 6 for 2/6, 3 for 1/6	4	6
.. Cactus, Empress of India, maroon-crimson, magnificent variety, each 1s., 3 for 2s. 6d.		
.. .. Henry Patrick, superb pure white, each 1s. 6d., 3 for 3s. 6d.		
.. .. King of Cactus, immense flowers, similar to Jaurezi, each 1s., 3 for 2s. 6d.		
.. .. varieties, Constance, Jaurezi, General Gordon, Mrs. Hawkins, William Pearce, Mr. Tait, and others, 6 for 2s. 6d.	4	6
.. Single-flowered, all the most beautiful sorts, 6 for 2s. 6d.	4	6
HOLLYHOCKS, strong seedlings, for blooming this year, from a grand strain of choice double flowers	4	0
.. .. 6 for 2s. 3d.		
LOBELIA, King of the Blues, dark blue, with pure white eye, distinct and splendid, strong plants, each 3d. per 100, 17s. 6d.	2	6
TUBEROSES, American Pearl, beautiful double, pure white flowers, deliciously-scented. Planted now, in the garden, and taken up and potted before coming into bloom, will flower splendidly in the greenhouse in autumn. Fine roots, per doz., 2s. 6d., 6 for 1s. 6d., or 17s. 6d. per 100, post-free.		
CHOICE FLORISTS' FLOWER SEEDS.		
For Present Sowing. Per Pkt.—s. d.		
AURICULA, choicest Alpine	1	0
CALCEOLARIA, from a grand strain	1s. 6d.	2
CARNATION and PICOTEE, very choice, mixed, from stage flowers	1s. 6d., 2s. 6d.	5
CINERARIA hybrida, new dwarf, large-flowered, splendid	2	6
.. very choice, mixed	1s. 6d.	2
POLYANTHUS, finest gold-laced	1s. 6d.	2
PRIMULA, choicest red, white or mixed	1s. 6d.	2
.. alba magnifica, splendid pure white	2	6
.. Crimson King, magnificent	2	6
STOCK, Brompton, Scarlet Giant	6d.	1
.. very choice, mixed	6d.	1
SWEET WILLIAM, Daniels' Prize, superb strain of perfectly formed and beautifully-coloured varieties	6d.	1

HARDY FRUIT TREES.

I HAVE often wished for more full and authentic information than most of us now possess in relation to the hardy fruits generally cultivated in those countries which endure a much lower winter temperature than our own, and I hope these few lines may induce cultivators in Canada, Russia, and other northern parts of Europe and America, to give us information on this important question. I believe I am right in saying that our English Apples, as taken out by the earlier settlers in America, as also the fruits imported from France by the early colonists of Canada, did not succeed as it had been hoped they would do, and it was only after the importation of the hardier varieties from Russia and other parts of Northern Europe, and the rearing of seedlings from these, that the present fine race of Apples grown in America was produced. The effects of climate on fruit trees and their products are very curious and interesting, and even restricted localities are represented because best fitted to the peculiarities of particular varieties. Do what we will the Newtown Pippin does not thrive nor attain the flavour in Europe that it does in New England, and the Pears of the Continent are, broadly speaking, superior to those of Great Britain. Indeed, as a rule, we may safely infer that the fruits best fitted for any country are the seedling varieties raised in that country, either from hardy and prolific varieties of good quality, or by cross-breeding between these and hardier variations from countries colder than our own. Rearing new varieties of fruit, however, is tedious work, requiring capital and patience, and then, as Mr. Rivers has recently told us, the raiser is by no means certain of reaping the harvest he has so laboriously and patiently sown. In proportion to the difficulties and time required, however, is the interest evolved by the pursuit, and I hope that our fruitists will make due efforts to import the hardiest fruits of Europe and Northern Asia, and use them in the improvement or amelioration of our own domesticated kinds. In the current (May) number of *Harper's Monthly Magazine*, in an interesting article by Dr. Lans-

dell on the salt mines of Iletsk, I came upon the following extract relating to fruit culture on the banks of the Volga:—

"The Volga seemingly is a very old fruit-growing region, for in Russian poems of a thousand years ago the maiden whose neck was like that of a swan, and whose lips were like Cherries, had cheeks like a Volga Apple. In the southern part of the Government of Kazan through which we had passed there are twelve villages where the peasant proprietors are Apple growers, and so hardy are their little trees that they are often loaded with fruit after a winter when Fahrenheit's thermometer has sunk to more than 50° below zero.

"In the public square at Simbirsk, with a climate as severe as that of Quebec, the wild Pear is a fine ornamental tree, and is cultivated around in orchards to the number, it is said, of 10,000 trees. Russia's Cherry district we had passed between Moscow and Nijni, the Vladimir Cherries being known all over the country. More than a hundred growers each had 15,000 trees, and sometimes entire trains are loaded with this one product. Cherries are grown also in villages of the Volga, and Plums likewise. About Moscow and Vladimir the Plum trees are dwarfs, often bushes; which seems to be a provision of Nature, for if a Plum bush is killed by cold to the ground, new shoots soon grow and bear."

Of course I know that Apple trees which grow on the Volga and can endure a depression of 50° below zero, may not be in all ways suitable for culture in English gardens, but the chances are that the best of such varieties, if crossed with our own Cox's Orange Pippin and other choice varieties, would yield us a race hardier, and so better fitted for the exposed parts of northern England or Scotland than any we now possess. They being both dwarf and prolific naturally—that is to say, without any grafting or working of any kind—would suggest their being readily propagated by layers or cuttings, and thus eminently fitted as stocks. Of course I know that to enable a tree to withstand a low winter temperature a high and tolerably dry summer temperature is necessary. For example, the climate of Ireland is relatively mild during the winter season, but less sunny during the summer season than Great Britain, and as a consequence shrubs and other plants are less able to withstand an exceptionally severe winter depression than is the case in England. In like manner I know that these dwarf Russian Apples and Plums would prove less hardy here than beside the Volga, but yet they would prove much hardier than those we now cultivate, and their introduction would doubtless add strength to our own cultivated races.

In fruit growing, as in gardening generally, there is no standing still. We must either improve or we shall go back, and the best way to improve our native fruits will be to cross-breed with new blood in the shape of hardier kinds, from widely separated habitats and different soils. The Asiatic Grape Vine did not succeed in America, but by inter-breeding it with native species a race of Grapes better suited to the climate has been obtained, and even the French vineyard cultivators, have been glad to procure these American varieties to repair the ravages of the Phylloxera during recent years.

One of the very best undertakings for our Royal Horticultural Society to undertake just now would be this task of collecting the wild species and cultivated variations of our hardy fruits, other than those now grown in England. It has always seemed to me, and doubtless to others also, a sad waste of time and capital to grow at Chiswick the ordinary kinds of Apples, Plums, Pears, Cherries, Grapes, &c., which are now to be seen in most nurseries and private gardens. The true work and business of a horticultural society is not with the old but with

the new, and to be worthy of enlightened support, the very fringe of progress must be lifted for us as it was lifted for our predecessors in the days of Lindley and Knight, Fortune, Douglas, Hartweg, and many others one need not name.

In conclusion, I venture to differ altogether from those who say that the days of collecting wild plants is past or played out, and that the hybridisers can now carry on the work, and supply the collector's place to greater advantage. This view is the subtlest of all errors, viz., half a truth. There is room for the collector now as in the past, for the cultivator always, but the hybridist cannot with safety kick down a ladder on which he stands. The hybridiser may give us a few ephemeral forms of Orchids, Arads, Amaryllids, or florists' flowers, but what can he hope to do with our hardy fruits, vegetables, and grain-yielding grasses, when their wild prototypes are as yet unintroduced to our gardens? Looking broadly at the question, there is as much room for collectors now—more in fact—than at any other time. The world of hardy flowers, now so popular, is practically untouched, and as I have said of the hardy fruits of Northern Asia, we know practically nothing more than the late Karl Koch has told us in his books.

Instead of collecting wild plants, and especially hardy fruits and flowers, being played out, I believe the appointment by the Royal Horticultural Society of a really good collector, would be one of the most profitable investments the Society could make at the present time. Gardening is changing its ground now as it ever has done, and people generally are opening their eyes to the fact that the glasshouse culture of a few stove plants or Orchids is a very small part of a great question. Gardening is creeping out into the fields, and every day the demand is greater for the best fruits, vegetables, and flowers, that will grow in the open air. *F. W. Burbidge.*

NEW OR NOTEWORTHY PLANTS.

LISSOCHILUS GIGANTEUS, *Welwitsch.*

This is one of the most extraordinary plants in the vegetable kingdom. [See fig. 83, p. 617, from a specimen shown at the Temple Show of the Royal Horticultural Society.] I saw in September last two plants at Sir Trevor Lawrence's. They were not of a surprising growth, so that I never thought it possible one of them could flower so soon. They had a few cuneate oblong-acuminate plicate leaves, about 3 feet in length. That was all. The peduncle is atated to reach, in its native country, 16 feet in height. It bears a rather lax raceme. The very conspicuous bracts are cuneate-oblong convex apiculate, shorter than the stalked ovaries, and are upwards of 1 inch in length. The cuneate ligulate apiculate greenish sepals are retrorse. Two wide oblong broad petals form a hood over the lip; they are lilac, with darker veins. The lip has a wide goitre-like spur, apiculate at the top, and a three-lobed lamina. There is a purple border to the anterior lacinia. Three yellow keels project from its centre, two over the part of the spur under the column, and two mauve-coloured lines on each side. The column is trigonous-green, with yellow at the base inside. The anther is biapiculate. The pollinarium is not quite identical with that of the wild-grown specimens—a very unusual circumstance. The flowers are twice as large as those of a good *Warrea tricolor*. Sir Trevor kindly sent me a flower of the plant collected on the Congo by Monsieur Auguste Linden.

I regard this achievement as one of the greatest successes ever earned in horticulture. The plant is one of our Orchid wonders, and is without a worthy

rival. It displays well formed flowers, whereas *Grammatophyllum speciosum*, no doubt its nearest rival, indulges in monstrous flowers. But this is not all. It belongs to a group that has tormented our best collectors. We may not speak of *Lissochilus streptopetalus* and *L. speciosus*, species which, under the old régime, flowered regularly during my early youth. The conditions under which those plants grow are widely distinct and cannot be compared to those of *Lissochilus giganteus*. Sir Trevor brought over from Ghent two plants at the end of September last, and after seven months one was in flower. Such a success, decidedly not fortuitous, is quite extraordinary, and will partly repay Sir Trevor for the many disappointments which are unavoidably connected with the possession of such a collection as his.

The plant was discovered by our good friend, the late Dr. Frederic Welwitsch, before 1862 or 1863, in the Angola district of Golungo Alto, where it is widely spread over nearly the whole district in *paludosis spongiosis sylvaticis*. He assigns it to *regio secunda*—1000 to 2400 feet altitude. Dr. Welwitsch told me that this *Lissochilus* is occasionally submerged, and afterwards roasted in a soil as hard as brick. This circumstance, indeed, it was which made me despair of the plant ever flowering in our stoves. The great *philtre* of Nature, a very copious suddenly spread watermass [syrringing], representing the dew, might be more used than it is nowadays.

The plant was found further to the north by the excellent observers, Mr. and Mrs. Monteiro. They observed it growing at the mouth of the River Zaire (Congo), near Porto da Lenha, on the banks of the river, in the mud, where it was covered by fresh water at high tide. *H. G. Rehb. f.*

We cite the following particulars relating to this extraordinary plant from Mr. Johnston's work on the Congo:—

"The hot sun and the oozy mud call into existence a plant life which must parallel in rank luxuriance and monstrous growth the forests of the coal measures, and reproduce for our eyes in these degenerate days somewhat of the majesty of the vegetable kingdom in bygone epochs.

"In the marshy spots, down near the river shore, are masses of that splendid Orchid, *Lissochilus giganteus*, a terrestrial species that shoots up often to the height of 6 feet from the ground, bearing such a head of red-mauve, golden, scented blossoms as scarcely any flower in the world can equal for beauty and delicacy of form. These Orchids, with their light green, spear-like leaves, and their tall swaying flower-stalks, grow in groups of forty and fifty together, often reflected in the shallow pools of stagnant water round their bases, and filling up the foreground of the high purple-green forest with a blaze of tender Peach-like colour. . . . Clumps of a dwarf Palm, *Phoenix spinosa*, which bears a just eatable starveling Date, hedge in these beautiful Orchids from the wash of the river, and seem a sort of watermark that the tides rarely pass: but the water often leaks through the mud and vegetable barrier, and forms inside the ring of dwarf Palms many little quiet lagoons, not necessarily unhealthy, for the water is changed and stirred by each recurring tide; and in these lagoons bordered by Orchids and tall bushes, with large spatulate leaves, and white shining bracts about their flower-stalks (*Mussaenda*), by *Pandanus*, by waving Oil Palma, and by Mangrove trees poised on their many feet, and telling out against the shining sky with their lace-like tracery of leaves—in these quiet stretches of still water are the homes and feeding-grounds of myriad forms of life: of blue land-crabs, whose burrows riddle the black soil; of always alert and agitated mud-fish, flapping and flopping through the ooze; of tiny amethystine red-beaked kingfishers; of kingfishers that are black and white, or large and grey and speckled; of white egrets; of the brown and stork-like *Scopus umbretta*; of spur-winged geese; and of all-devouring vultures. A rustling in the vegetation, and a large *Varanus* lizard slips into the water; or on some trampled bank a crocodile lies asleep in the warm sun, with a fixed smirk hanging about his grim muzzle. The lagoons are places seething with life—life that is ever stirring, striving, and active; and

FIG. 83.—LISSOCHILUS GIGANTEUS: UPPER PORTION OF FLOWER-SPIKE. (SEE P. 616.)

From a plant grown by the President of the Royal Horticultural Society, and exhibited by him at the Temple Show, May 17—18. Leaves 4 feet long, 4 inches wide. Total length of flower-spike, 8 feet 8 inches. Petals rich rose-coloured; lip purple, with darker stripes.

when you suddenly arrive, slipping and splashing in the watery footholds, the sudden silence that greets you is rather the frightened expectant hush of a thousand apprehensive creatures."

The genus *Lissochilus* is near to *Eulophia*, and was first described by Robert Brown, and now includes about thirty species, natives of Tropical and Southern Africa. They are terrestrial herbs, with pseudobulbs and long plicate leaves. In Colonel Grant's *Botany of the Speke and Grant Expedition*, Professor Reichenbach describes two species of this genus—*L. Grantii*, found by Colonel Grant in flower on the east coast range, lat. 6° 38' S., at an altitude of 4700 feet; the plant grows near the water, and has a yellow flower. The other species was found at Karagué in March, and has a single unbranched erect stem, with the linear sepals green, spotted with brown, and the rest of the flower yellow.

ODONTOGLOSSUM × *MASEREELIANUM*, n. *hyb.*

Amongst an excellent collection of Orchids exhibited at the recent Ghent Exhibition by Mr. E. Vervaeet & Co., of Mont St. Amand-les-Gand, one of the most attractive objects was an *Odontoglossum* in so brilliant a state that it might have been compared to Dr. Harvey's *Odontoglossum ferrugineum*, had it not had the sepals and petals both orange, and the lip yellow. The petals were edged, with some spreading angles. The flower gave the impression that the darker orange colour was limited, forming spots on a lighter ground. The light yellow lip had a cordate, nearly square base, toothletted at the margins, suddenly dilated into a cordato-reniform lobed, denticulate anterior blade. The callus at the base is nearer to that of *Odontoglossum sceptrum* than to that of *Odontoglossum ferrugineum*. There is not the rich tomentum of the first-named plant. The wings of the column are fringed and lacerate. The bulb and leaves are those of *Odontoglossum luteo-purpureum*. This plant justly bears the name of Monsieur Masereel, a most distinguished orchidist of Ghent. *H. G. Rehb. f.*

NOTICES OF BOOKS.

THE ART OF PREPARING VEGETABLES FOR THE TABLE. By Sutton & Sons, Reading. (London: Adams & Co., Paternoster Row. 1888.)

In a country where it is the rule to serve vegetables only in one way, viz., "boiled to a pap," this little book ought to be welcome. The average English cook's only way of sending up a Cauliflower, for instance, is to boil it in water until it forms a mealy, ill-shapen mass, on which (in most cases) she "claps" the cold china cover of the vegetable dish. Messrs Sutton, in their treatise on the art of preparing vegetables for the table, endeavour to inculcate something better. Endless are the ways in which vegetables may be cooked, and rendered wholesome, palatable, and attractive on the table, and the various directions given in the work before us are so simple that there can be no difficulty in following them.

In another edition it will be as well to mention in the recipe for a salad that the Lettuces should be dried by shaking them in a cloth, or, still better, in one of the convenient little French wire salad-baskets to be procured now in this country. Very few cooks think of drying the salad after they have washed it, or if they do attempt it, they usually wrap it in a cloth, and brnise the delicate salad by striking it with their hand on the table. It should also be hinted that a salad is much nicer if "broken up" than if cut with a steel knife. All the ordinary kitchen garden materials are dealt with in this little volume, and we trust it may do something to remove from us the reproach that, while we have the best of vegetables in this country, we are a people of one idea as to the cooking of them, and consider the subject so unimportant as to be beneath our notice, and unworthy of our attention.

NOTES FROM BELGIAN NURSERIES.

(Continued from p. 567.)

E. VERVAET & Co., MONT ST. AMAND, make a great feature of Orchids, and for the better inspection of the principal ones in flower have arranged a cool and pleasant house with tiled floor, and a luxuriously arranged little sanctum at the end. In the several houses of *Odontoglossum* and *Masdevallias* some good things were in bloom, so also in those devoted to *Laelias* and *Cattleyas*, the *L. purpurata* showing excellently for flower. *Cypripediums* are well grown in large numbers; and a house is set apart for seeding in which we noted a good method of recording the parentages of the seedlings on imperishable, long triangular labels of clear glass, the names being written with a diamond. This is a good plan as such tallies are not unsightly, they are not to be obliterated, and they do not obstruct the light. A considerable collection of choice Orchids is to be found in this nursery, also a large house filled with fine Tree Ferns, some excellent Palms, &c.—all the plants exhibiting good culture.

M. A. VAN GEERT, MONT ST. AMAND.

At this fine nursery, where the sympathies of the English nurseryman with its genial and clever proprietor always lead him, we found a very fine display of Orchids, in spite of the great and numerous exhibits of those plants which were sent from this establishment to the International Exhibition. M. van Geert cultivates his plants up to the very highest standard, and has a clever way of bringing those in flower into view by neat arrangements at the entrances of the houses. Here we found one of the best Orchid shows in Ghent, very rich in *Cypripediums*. Among the newer plants are *Anthurium Comtesse de Kerchove*, *Nidularium argenteum striatum*, a very effective *Bromeliad*, and a grand lot of *Azaleas* and *Cliveas*, in all sizes and stages, from the young to the specimen flowering plant. Palms, *Aspidistras*, *Phormiums*, and other decorative plants in great profusion, and rare and good plants in the open air up to the best standard.

M. D'HAENE.

"Birds of a feather flock together," and M. D'Haene, undeterred by the presence of brother nurserymen to right of him, to left of him, in front and behind, hoists his standard at Ledeberg, and undoubtedly holds his own. This is a large establishment, excellently kept. Palms, *Rhododendrons*, *Azaleas*, *Draecenas*, *Cliveas*!—what can a poor reporter find to say about them that he has not already said, or may not have to say again? But here, house after house of Orchids testify to the great strides that have been made of late in Orchid culture in Belgium. Our notes make mention of *Lycastes*, *Dendrobium albo sanguineum*, and *D. draconis*; of *Trichopilia fragrans*, *Laelia elegans*, *Cattleya Skinneri*, *Cypripedium villosum*, and others galore. We have no doubt we saw all these; but the riches of Ghent are overpowering, and their magnitude must serve as our excuse for the imperfection of the record. *Caladiums* and *Gloxinias* are done well here. Here, too, is a magnificent *Pandanus* called, we know not whether by any authorised registrar, P. D'Haenei. It has broad channelled leaves of glaucous green hue, faintly blotched on the surface, and with spiny edges. The singular and beautiful *Pavonia Wioti*, a plant described by our much-regretted friend, Morren, was in bloom. The depth of its colouring and its singular form should make this plant attractive to the plant-lover. It would not be a Ghent nursery if there were not some standard and pyramidal *Bays*. To form a standard, the stem is allowed to run up to the desired height, the side-buds being removed, while the leaves from whose axil they spring are carefully preserved. When the stem has arrived at the required height it is allowed to branch, the branches being pinched in from time to time, so that in due time a good symmetrical head is formed.

For the formation of pyramids an opposite course of procedure is followed, the lower branches being allowed to grow, and the upper ones pinched in so as to secure the desired shape.

As to the Ghent *Azaleas par excellence*, it may be here mentioned that they are hybrids raised originally at Ghent by crossing the oriental *A. pontica* with the North-east American species, such as *A. viscosa*, *calendulacea*, and *nudiflora*. Mr. Burbidge narrates that the first person to effect this cross was a baker at Ghent—one M. Mortier. *A. sinensis*, commonly called *A. mollis*, the Sino-Japanese plant, is very prolific of varieties, which have become even more numerous now that it has been hybridised with the Ghent section. Horticulture is truly cosmopolitan, and Ghent does appropriately to call her shows international, for in the veins of one *Azalea* (the figurative expression may be pardoned) may run the mingled blood of natives of the Atlantic States, of the Caucasus, of China, and Japan.

Both these *Azaleas*, or *Rhododendrons* as they are in reality, have the flowers surrounded by bud-scales, which, in place of remaining on the stem for some time, soon fall off. In the Pontic and American forms proper the corolla is funnel-shaped, with a long slender tube, a short limb, beyond which the stamens project, while in the true Chinese plants the corolla is rotate or bell-shaped, with a short tube and a broad five-lobed limb, beyond which the stamens and style do not protrude. This is what the books say, but *M. les horticulteurs de Gand* have changed all that, and how we are to distinguish between these forms now we cannot say. M. Maximowicz, who has made a special study of these plants, discreetly omits to commit himself, and others with less experience will do well to follow his judicious example.

(To be continued.)

TREES AND SHRUBS.

THE CRACK WILLOW (*SALIX FRAGILIS*).

THERE is a large tree of this species standing on the bank of a small stream within view of my writing-room window, which for a few weeks every spring is one of the most beautiful objects in the landscape. Just now it is especially attractive. The outline of the tree itself is free and graceful, the green of its young foliage is of the most exquisite tint, and this, coupled with the green and gold of its numberless catkins, makes this tree one of the best for ornamental effect at this season of the year. It is more especially valuable where late leafing trees, such as Elm and Oak, predominate, as it is fully three weeks ahead of either of these. The contrast of the bright young foliage against the still bare branches of the surrounding trees, and against the deeper green of a background of meadow, at once arrests the attention. A few weeks hence the leaves will assume a darker hue, and the colour closely assimilate with the surrounding tints. In this way the tree fades from notice during the summer and autumn, to reappear in its freshness as the spring comes round.

The branches of the Crack Willow are of comparatively little use for the purposes to which the young wood of this genus is generally applied, but when allowed to grow to full timber size—in, of course, its maiden form, as any attempt at pollarding would at once destroy its beauty—its wood becomes useful, and, as a landscape tree, the early summer effects are pleasing. *D. J. Y.*

MAGNOLIA CONSPICUA.

This is one of the most desirable of all the *Magnolias*, as not only is it exceedingly free-flowering, but it is the first to open, and as the blooms are pure white, of moderate size, and deliciously fragrant, they are very valuable for cutting for decorative purposes, or working up in bouquets. The most suitable situations for planting and growing the *Magnolia conspicua* are either against a wall facing

the sun, or in the foreground of other shrubs where it can have a southern aspect and be well sheltered, as otherwise it is apt to get its flowers injured in spring by frost or cold winds, which soon spoil their beauty. In habit the plant is free-growing and deciduous, the blossoms coming out before the leaves, the way to increase the stock being either by layers or cuttings, the first named of which may be buried with sharp sandy soil at any time, with just the ends of the shoots left out of the ground, but the cuttings must be taken off and put in under handlights during the autumn. *J. S.*

SHANTUNG CABBAGE.

(BRASSICA CHINENSIS, L.)

In a letter dated April 21, 1887, Mr. George Hughes, late Commissioner of Customs at Chefoo, China, offered the Royal Gardens seeds of a Cabbage which has long been in high repute in China, but which appears to be little, if at all, known in this country. Mr. Hughes stated:—"I have just received from Chefoo, North China, a small packet of Shantung Cabbage seed, and I should like, if possible, to introduce this delicious Cabbage into England. It grows in the North of China, is Lettuce-shaped, and weighs from 5 to 8 lb. When boiled it is nearly as good, if not quite, as Seakale; eaten raw, in a salad, it is of so delicate a flavour that I know of no vegetable in England to approach it. It is an autumn Cabbage, should be planted about 18 inches apart, thrives best with moisture, and in Shantung is well watered every day; there the seed is sown in June. When nearly full grown it should be tied round, so as to give it a good white heart. If it can be acclimatised in this country it will be a great addition to our vegetables."

The seeds received at Kew, being few in number, were carefully cultivated. They were sown in a heated pit on May 3, and in about a fortnight all had germinated. They were pricked off into boxes, and when large enough transferred to pots. They were kept in a cold frame until the beginning of June, when they were planted out in beds of rich soil about 18 inches apart in the rows, and the same distance from row to row. About the middle of July the plants were tied up in the same way as Cos Lettuce, and when well filled and blanched were cut for use. They were pronounced to be excellent. The seed ripened only sparingly, probably owing to the dry weather of last summer.

It is possible that this Chinese Cabbage may prove a useful addition to English gardens. The kinds most highly esteemed at Peking are those from the neighbourhood of the little town of Ngan-sun. These are said to be reserved for the table of the Emperor. They are eaten either raw, in a salad, or cooked and seasoned with salt.

Under suitable circumstances, the cultivation of this Cabbage would doubtless prove as simple and as successful as with the ordinary Cabbage. Botanical specimens of Chinese Cabbage were received at Kew in 1886 from Mr. F. S. A. Bourne, H.M. Consular Agent at Chungking. Under the native name of *Pai-tsai* he describes it "when young it is eaten as a Cabbage. It is also cultivated for its seeds, from which oil is pressed and used for light and cooking." In the *Index Floræ Sinensis*, part 1, p. 46, by Forbes and Hemsley, *Brassica chinensis*, Linn. *Ann. Acad.* iv., p. 250, is reduced under *Brassica campestris*, L. A list of Brassicaceous plants from China, with notes supplied by Mr. Bourne, is published by Mr. Hemsley in the *Gardeners' Chronicle*, vol. xxvi., n.s., 1886, p. 40.

A very complete account of the Shantung Cabbage is given in *Le Potager d'un curieux, histoire, culture et usages de 100 plantes comestibles peu connues ou inconnues*, par A. Pailieux et de Bois, Paris, 1885. It is here described as *Pé-tsai*, or *Chou de Chine* (*Brassica chinensis*, L.). Further information may be obtained from the *Bulletin de la Société Centrale d'Horticulture de France: Note sur la culture du Pé-tsai aux îles Maurice et de Bourbon*, par M. Breon, vol. xxiii., p. 142.

Mention is also made of the *Chou de Schangton*, or *Pé-tsai*, in the *Bulletin de la Société d'Acclimatation: Productions de la Chine*, par M. l'Abbé David, 2 série, t. ii., p. 237. Ce mémoire contient, au sujet du *Pé-tsai*, ce que suit: "Comme plantes alimentaires, on trouve dans nos jardins . . . le *Pé-tsai*, dont les Chinois consomment une énorme quantité, et qui vaut plus que tous les autres légumes réunis; les Européens le trouvent aussi fort bon et de meilleure digestion que le divers Choux d'Occident."

A figure with cultural hints on Chinese Cabbage, or *Pé-tsai*, is given in the *Vegetable Garden* by M.M. Vilmorin-Andrieux. London: John Murray, 1885, p. 146. *Kew Bulletin*.

ORCHID NOTES AND GLEANINGS.

CATTELEYA LAWRENCEANA.

THIS *Cattleya*, coming from a country hitherto little explored, was perhaps as eagerly sought after as any introduction of recent years, and it was thought that there was very little probability of further consignments coming to this country for some considerable period of time. However, what had once been done could be done again, and more importations of the plant have arrived, which quickly found purchasers, and which are now becoming well established. When it flowered for the first time, about two years ago, a feeling of disappointment was felt by some persons, not so much with the colour or number of the flowers as with their size when compared with many other choice species already in cultivation. The blooms certainly were small thus compared, and the several parts of the flower were rather narrow: the lip, too, appeared a little pinched in, and if placed side by side with many others with which it was expected it would come into rivalry, the palm for beauty could not be given to the new-comer. The second year of blooming came, and knowing what to expect its blooming was hailed with pleasure, and additions to the stock were made as soon as they could be obtained. The third year has come, and from the stout home-made growths and plenty of healthy roots, which will bear any extra strain upon their vitality, we are enabled to see that this species is in reality a most beautiful flower, occupying a place almost by itself (in some degree resembling *C. Skinneri*), still sufficiently distinct to be valuable as a decorative subject. At first it was anticipated that only one form was likely to appear amongst those imported, and even now the dark one is commoner than any other, and amongst these are some which stand out from their fellows in regard to colour, and the breadth of petals, the more open, expanded lip. I have this spring seen several such, that gave me a better idea of its value than some of the dark ones I had hitherto observed. Again, I have seen this season one or two plants of a form that is novel; these were of a very light rose colour with a lip of the same pale hue, and a white throat; this is a very pretty and distinct form, and those who possess it will doubtless take every care of it. There is another variety intermediate between these two, the flowers of which are light mauve, open lip, the blooms beautifully veined and striped, as are many varieties of *Cattleya maxima*. The blooms of this *Cattleya* are larger than the dark ones, in fact, each of the pale forms, so far as I have observed them, are larger than those of deeper colour. There are inquiries being made of pure white varieties, and remembering the white forms of *C. Skinneri*, *C. Mossie*, *C. Mendelii*, *C. maxima*, *C. Trianae*, and one or two others which have appeared, it is probable that one such may one day appear. When this happens there will be an eager contest for its possession. The treatment of this species is not difficult, for, like the majority of *Cattleyas*, it enjoys plenty of light, but not continuous sunshine. Morning sunshine is most helpful, and the earlier rolling up of the blinds than is sometimes practised may safely be adopted; but to stand plants where the mid-day sun falls directly on them after its rays

have passed through the glass of our houses—which latter is sometimes not of the best—is very hazardous. If the imported plants are small, they may be grown in baskets, using potsberds and charcoal plentifully, and filling up only the crevices with the best fibrous peat. By so doing water may be freely afforded, and souring of the materials prevented. A free-growing temperature should be maintained, such as suits *C. Mossie*, during the summer months, and a period of rest given, extending from November to February, at which time the flowers appear at the base of the sheaths. When it becomes better established I feel certain this *Cattleya* will prove a most useful plant for home decoration, and when large masses are grown, most acceptable in an exhibition group. *Vanda*.

ONCIDIUM MURINUM, Rehb. f.

I am indebted to Mr. B. S. Williams, of the Victoria and Paradise Nurseries, for a splendid panicle of the above-named species (described in *Linnaea*, vol. xli., p. 20, in 1877). It is a decidedly pretty species, belonging to Lindley's section *Microchila*, in which the lip is small and leathery. The flowers are golden-yellow, except the column, which is dull crimson-purple, and making quite a striking contrast with the rest of the flower. The lip is triangular, sessile, coriaceous, and with a pair of roundish prominent calli in the centre. Although the flowers are rather small, they are thickly set on the panicle, and present quite a mass of colour. The whole inflorescence appears to have been from 2 to 3 feet in length, and the flowering portion a foot long by about 5 inches wide. The three lower branches had been removed, but the seven remaining ones bear no less than 150 flowers. The side branches of the panicle are again branched, and the ultimate branchlets present a zig-zag appearance. It exists in several collections, for twice recently small branches have been sent me to name, and the first time I failed to identify it. Mr. Williams, however, has the plant named, and simply sent the specimen to be preserved in the Herbarium; but it was not until seeing this piece that I became aware what a pretty species it is. *R. A. Rolfe*.

INSECTS INJURIOUS TO FOOD PLANTS AND TIMBER TREES.

A YEAR or two since Mr. Mosley, of Huddersfield, prepared for the Kew museums a series of twenty mounted sets, showing the destruction caused by certain insects to garden plants and timber trees. These have recently been increased by the addition of twenty more mounts, prepared as before by Mr. Mosley. These sets are so compact and instructive that they deserve to be better known than they apparently are. Each insect is treated separately, and its life history illustrated by actual specimens, as well as by descriptive text. Each is contained in a uniform glazed mount 12 inches by 8. Amongst those recently added to the Kew collection may be mentioned the following:—Gooseberry sawfly (*Nematus ribisii*). This shows three of the real caterpillars on a bared twig, the cocoons and perfect flies, a single leaf showing the borings made by young larvae, and some twigs with the leaves destroyed, together with a good drawing of the fly very much magnified.

This destructive creature causes immense injury, not only to the Gooseberry, but also to the red and white Currant. The flies appear during the first warm days of April, and at the end of the month and in May the eggs are laid along the ribs of the leaf on the under side, as many as sixty eggs on one leaf. In about a week the caterpillars hatch and proceed to eat small holes through the leaf. They become fully grown in June and July, when they bury in the earth and change to chrysalids in silky cocoons, the flies coming out in August. These produce another generation of caterpillars in the autumn, which remain as caterpillars in their cocoons all the winter, changing to chrysalids in spring, and producing the April brood of flies.

As prevention and remedies, it is stated that if the bushes are looked over in the early part of May, the perforated leaves may be detected, which should, with their colonies of young caterpillars, be picked off and destroyed. Lime, soot, ashes, or flower of sulphur, thrown over the infested bushes while they are wet, will destroy the grubs. Advantage may thus be taken of dew, or, if the bushes have to be specially wetted, a little paraffin, quassia, or soft soap added to the water will make the work more certain. Powdered hellebore is also used in the same way, but is liable to poison the fruit. After a bad attack the surface soil should be scraped away in winter, when the caterpillars are in, to the depth of 2 or 3 inches, and buried; the fresh soil being mixed with a dressing of lime, gas-lime, or paraffined ashes, and spread under the bushes.

Another pest to the Currant is the Currant clearwing (*Sesia tipuliformis*). This is illustrated by mounted longitudinal sections of the stem showing the long channels made by the larvæ; also a drawing showing the larvæ in the stem, and a twig with pupa case protruding after the exit of the insect, and good specimens of the perfect moth. The insect is described as being generally common in gardens where Currant bushes are grown, though not often noticed from its quick flight and great resemblance to a fly. The moths appear during hot weather at the end of June or beginning of July. The eggs are laid upon the stems, and as soon as the young caterpillars hatch they bore through the pith and feed upon it during winter. The flagging of the leaves during hot weather indicates the damage caused by this insect. As a cure it is recommended cutting away infested branches or capturing the moths as they come out.

Amongst other insects illustrated are the Ash beetle (*Hylesinus fraxini*), Carrot fly (*Ptila rosea*), Nut weevil (*Balaninus nucum*), Codlin moth (*Carpocapsa pomonana*), Pine-bark beetle (*Hylurgus piniperda*), and others.

For teaching purposes these handy mounts are excellent, and might be usefully introduced into schools. *John R. Jackson.*

FLORISTS' FLOWERS.

YELLOW CARNATIONS.

A visit recently paid to Mr. E. S. Dodwell's garden at Oxford, was the means of discovering that he has a number of seedling yellow Carnations, obtained from carefully made crosses, which can scarcely fail to produce some varieties of much merit. In 1886 Mr. Dodwell received from Mr. Gyles, of Kilmurry House, Waterford, a fine batch of yellow, buff, and apricot seedlings, with markings of various hues and breadths, all very promising, and such as he expected would make a noise in the floricultural world when they came to be known. Mr. Dodwell had already utilized the pollen of a few of the best of the yellow Carnations in Florence, making this fine variety the seed parent; and he has among the progeny several worthy to be grown with those obtained from Mr. Gyles.

An important and most interesting feature of these seedlings is their distinct advance towards the longitudinal markings of the Carnation. *R. D.*

ALPINE AURICULAS.

Mr. H. Turner said at the meeting of the Royal Horticultural Society on Tuesday, May 8, that he thought the public were beginning to admire the newer alpine Auriculas more than they do the refined show varieties. It is not to be wondered at, for they are very showy, very fine and pleasing, and so much of stoutness has been got into the flowers of late years that they are lasting also. In the case of my own select collection I find that the alpinists outlast in the duration of their beauty and floral service the show types, and this will have its effect in raising them in the public estimation. The work of im-

provement begun at Slough nearly twenty years ago, has gone on very rapidly in recent years, and till something like perfection has been reached in the variety named in memory of the late Mr. Charles Turner. This was seen in its best form at the National Auricula Society's show on April 24, when it overtopped anything else claiming to be new. Indeed, so great has been the advance that though some dozen seedlings were staged for Certificates at the last meeting of the Society, only two gained this honour; one was named Harry Turner, a fine, bold, stout, well-formed gold-centred flower with shaded maroon and claret-purple margin, and Mrs. Harry Turner, a white-centred variety, with a shaded salmon and violet margin, distinct and very pleasing; a large, flat, and finely formed pip. At the Auricula shows prizes are offered for gold-centred and white-centred flowers. What is badly wanted is some really fine white-centred varieties—white centres that will not change to cream and pale yellow with age. One of the seedlings staged by Mr. Turner had the defect of displaying on the same flowers in a young state with golden centres; when half developed, with sulphur, and when fully expanded with a dead cold ivory-white centre, which tended to impart to the variety a very confused appearance. We want white centres, that will keep of a living white until the flower commences to fade. We want also a race of white-centred alpinists, with shaded margins of blue, violet, and mauve—delicate in tone, yet gaily tinted, to give some relief to the varieties of maroon and shaded crimson colours, of which there are so many. The mauve and blue-edged varieties possess one fault that needs eradicating, namely, that the marginal shades open of a very pleasing and attractive character, and then they deepen into dull and expressionless tints. There is ample room here for the specialist. It is always observed at Auricula competitions that the white-centred alpinists are decidedly the weakest. It is because of this that efforts should be put forth to increase their number and improve their quality at the same time. *R. D.*

KEW NOTES.

RHODODENDRONS AT KEW.—The display of flowers on the large Himalayan Rhododendrons in the temperate-house at Kew has this year been exceptionally good. *R. Aucklandia*, which is certainly the queen of all Rhododendrons, is now magnificent, the heads of large beautiful white flowers being both abundant and full. Certainly this plant alone is worth a long journey to see. *R. Nuttallii*, which is equally gigantic in its proportions, has been almost as grand as *R. Aucklandia*, its deep bells, creamy-yellow at first, becoming pure white with age, being greatly admired. The red-flowered variety of *R. argenteum*, and of which there is a gigantic specimen at Kew, has lately borne numerous large trusses of bloom. When the flowers first expand they are crimson, then they change to deep rose, and finally become almost tawny before falling. *R. Veitchii*, *R. cinnamomeum*, *R. Windsori*, *R. niveum*, as well as several hybrids, are also in flower at the present time. The following three kinds deserve special notice:—

RHODODENDRON CHAMPIONI.

This interesting species was introduced to Kew from Hong Kong about ten years ago, and it was supposed to be especially adapted for pot culture, and useful as a greenhouse plant. Experience so far, however, is not favourable to this opinion, for, in spite of liberal and careful treatment, the plants at Kew have not borne flowers till this year, an example with flowers being in the large temperate-house now. It is about 2 feet high, branched, the leaves 5 inches by 2 inches, leathery, covered with glandular hairs on both sides. The flower is Azalea-like, 4 inches across, the petals spreading and pure white, with a few yellow spots on the upper ones. The calyx is peculiar, having narrow lobes nearly 1 inch long, and being covered with long silky white

hairs. The species evidently belongs to the ciliatum group.

R. COLLETTIANUM

is another interesting Rhododendron which we owe to Dr. Aitchison's visit to Afghanistan, who sent seeds to Kew from which a plant now flowering in the rockery was raised. The plant grows on the mountains at an elevation of 10,000—13,000 feet, and forms a small, compact-growing species with small ovate, glaucous-green leaves, like those of *R. ferrugineum*, and compact heads of small white flowers. It may improve under cultivation, or possibly may be turned to good account by hybridists as it is quite hardy.

RHODODENDRON KEWENSE X

This is the result of crossing *R. Aucklandia* with *R. Hookeri* at Kew in 1874, and plants of it have just flowered in the temperate-house for the first time. A flower-head was exhibited along with other Rhododendrons among the collection of plants and cut flowers sent from Kew to a recent meeting of the Royal Horticultural Society. The plant is a sturdy grower, the branches green, covered with very short glandular hairs; leaves 6 to 10 inches long by 2 inches broad, narrowed at both ends, shining green above, paler on the underside, petiole 1 inch long; flowers in a loose raceme on the ends of the strongest branches; pedicels nearly 1 inch long, calyx small, green, corolla broadly campanulate, 3 inches across, and 2 inches deep; segments $1\frac{1}{2}$ inch across, undulated, emarginate; colour very pale flesh, the unexpanded buds being deep rose. There are about twelve flowers in each head. It will be seen that the hybrid is intermediate between the two parents, and that it is a handsome addition to the greenhouse Rhododendrons. *W. W.*

GARDENER ASSOCIATES OF THE ROYAL HORTICULTURAL SOCIETY.

Sudden and severe illness have prevented me from replying sooner to the courteous and considerate criticism of Mr. G. F. Wilson, p. 468. With your permission I will now write a few last notes on the impolicy and injustice of establishing emasculated Fellowships for practical gardeners. It seems essential that its constitution and basis of membership should be promptly, wisely, and finally settled on such easy and honourable terms as to include the majority of practical gardeners. Not a few maintain that the difficulties—decline and fall of the parent society—were chiefly owing to the fact that most of the heads and hands that have done so much to evolve, mould, and control the science and practice of horticulture were left outside its pale.

True, honorary Fellowships were occasionally given for distinguished ability or service, but these were exceedingly rare, and never carried with them any of the special privileges of horticultural citizenship, though I have never been able to find a single clause in the charter depriving honorary Fellows of the full rights of the Fellows by purchase. And now the Council, aided by the Fellows' committee, have made another and a bolder attempt to bring in practical gardeners. The idea, the wish, is excellent, but, like many another capital idea, it is in danger of being marred or spoiled in the execution. Few things could have given such a grand impulse to the reconstituted old Society as the admission of 5000 practical gardeners as Fellows at an annual subscription of half a guinea each. But this generous proposal came forth half strangled with the traditional swaddling-bands of restriction and suspicion. True, the door was opened to practical gardeners, but the entrance was of such humble dimensions, and all who entered had their status cut down so much and their privileges so severely whittled away, that no gardener is likely to enter the Society that way.

Singularly enough neither of your accomplished correspondents, Messrs. G. F. Wilson and A. R. Smee, seem to see any limitation to gardeners in the

ticketing and disqualifying clauses of these proposals. But Mr. Wilson, in whose great and deserved success in obtaining guinea Fellows I heartily rejoice, fairly meets me on other grounds. In brief, his defence of the Society—that it cannot afford half-guinea Fellowships. It was the traditional faith of the Royal Horticultural Society that nothing less than two guineas would pay; now Mr. Wilson takes his stand on one. He says "he thinks a guinea is the lowest subscription that will support the Society." If so, my answer is, stick to the guinea, and refuse to go below it.

Will Mr. Wilson, or, perhaps, better still, Mr. Smeë—who estimates the value of these Associateships, that cost the Society so little, at £5 a-year to gardeners—be good enough to tell us how the extension of gardeners' privileges to the name of Fellow with a voice and vote in the management of the Society, would add a single farthing to the expenses of the latter? I wish to say emphatically that I cannot see how these Associateships are to benefit any practical gardener five brass farthings. Nay, more, and worse, so far as their influence extends, they will inflict a positive injury upon him; thus, the name Associate proclaiming to all the world that he is either unfit or unable to become a proper Fellow of the Society to which he belongs. Associateships are also to be paid for twice over, once with knowledge duly certificated, and again with half-a-guinea. Once obtained, they are to open the door to the best situations in the country, seats at floral and flower committees, and qualify for judgeships throughout the rural districts. Before thus attempting to ruin our gardeners wholesale by compulsion, I would respectfully entreat him to give my plan a fair trial. It is simply this: make gardeners Fellows for half-a-guinea a year, and give them voice and vote in the affairs of the Society.

As to the testing and certifying of knowledge as a further condition of Fellowship and a qualification for Council, committee, judgeships, &c., there is no objection to it, provided always that it is impartially applied to all sorts and conditions of Fellows alike, and that some duly qualified gentlemen undertake and certify to the necessary knowledge. But that a money qualification alone should be held sufficient for three grades of Fellows, and be thought to qualify them for every office, from President downwards, and that a knowledge test should be imposed on gardeners alone before they are considered safe to be admitted to see their own shows, or enter their own premises, is such a glaring example of class inequality and injustice as is not to be found in the practice of any other society in England.

Beyond the merest elementary rights of fully qualified Fellows, practical gardeners are by no means grasping as to privileges, nor likely to use them very frequently. Distance, difficulties of leaving home duties, cost of transit, fulness of occupation, keep most of them closely tied at home. As to whether half-guinea subscriptions would pay or not, more would depend on their number than ought else. Neither could there be any difficulty of fairly apportioning privileges to the ratio of pay. And as in the three cases of four, two, and one guinea subscribers the status, honour, and power of the Fellows are left intact and equal, why, in the name of common sense and generous comprehensive and popular administration, should not the last order of Fellows be served in proportion with the same sauce as has agreed so well with the other three orders?

Lest my objections to Mr. Smeë's scheme of adding a knowledge test to the money purchase of emasculated Fellowships of gardeners should be misunderstood, I may add that nearly twenty years ago, through your pages, I strongly urged the Royal Horticultural Society to become the centre of light and the fount of honour for horticulturists. That plea you have recently allowed me to urge afresh in your pages. *D. T. Fish.* [We believe that this is a question of money, and those who have gone into the matter carefully decide that at present it cannot be done. Ed.]

THE BULB GARDEN.

THE BULB GARDENS OF HAARLEM.

A GREAT admirer of what may be termed Dutch bulbs myself, I had often longed to see the fields of Hyacinths, Tulips, &c., growing in their native home, and this year I had the gratification of inspecting many of the principal gardens of Haarlem and the vicinity. If we refer to old records we find that the cultivation of the Hyacinth and Tulip may be traced back to the end of the sixteenth century, but it did not become an object of commerce until the beginning of the seventeenth; and by the middle of that century the love or rather passion for choice varieties of Tulips and Hyacinths was most intense. Altogether, apart from the extravagant prices paid for these flowers in the early years of their culture, it is certain that an almost uninterrupted course of commercial prosperity has marked the progress of their culture from these early ages until now, except during longer or shorter periods when an industrious people have been driven to exchange the implements of their profession for the appliances of ancient and modern warfare. The earliest notice of a public sale of Tulips known to me is given in the register of the city of Alkmaar, where it is stated that in 1637 they sold publicly, for the benefit of the Orphan Hospital, 120 Tulips with their offsets, for 9000 florins; and that one of these flowers, named *The Viceroy*, was sold for 4203 florins. Considering the value of money at that time, these sums seem to be enormous.

Later even higher prices were paid for Tulips; but they were mere gambling transactions, in which the bulbs never appeared at all. Beckmann, the author of a *Tour in South Holland*, says:—"The real truth of the story is, that these Tulip roots were never bought or sold, but they became the medium of a systematic species of gambling. The bulbs and their divisions into *perits* became like the stocks in our public funds, the objects of the 'bulls' and 'bears'; and were bought and sold at different prices from day to day, the parties settling their accounts at fixed periods, the innocent Tulips all the while never once appearing in the transactions, nor being even thought of." Beckmann further says that when the celebrated variety, "*Semper Augustus*" was not to be had anywhere—which happened twice—no species, perhaps, was oftener purchased and sold. This kind of sheer gambling reached at length to such a height that the Government found it necessary to put a stop to it."

In this enlightened but perhaps more prosaic age the bulb business is carried on with an earnest and patient determination to satisfy the requirements of every class, from the prince to the peasant; while the great and ever increasing facilities of transit enable the growers to send their produce into every country where the refined art of gardening prevails. The prices, too, are surprisingly low, considering the large amount of capital required to cultivate and manure the ground as it ought to be done; indeed, all the large growers are at the greatest pains to grow their stock well, and also to keep the varieties quite true to name. The system of culture pursued now is that which has been in practice for many generations. There is no secret in it, and any intelligent gardener might go and do likewise. The climate is not different from our own, at least as regards temperature, for climatic influences may be at work which we cannot quite understand; but the real difference is in the soil. This is of considerable depth, and is composed of a very large proportion of sand; the remaining portion seems to be decayed vegetable matter. It is of such a nature that high drying winds would blow it into heaps, in fact it is necessary to throw something over the surface to keep it down. At the present time they are throwing the cut spikes of the Hyacinths over the newly dug ground, or liquid cow-manure, which cakes over the surface and keeps it stationary. Where Potatoes are planted it is necessary to insert tufts of straw about 18 inches apart in the ground these hold it in its place until the Potatoes are up.

The ground for the Hyacinth lies fallow for one year; it is now being dug up and well enriched with solid cow-manure; this is very dear, costing about 10*l.* for a barrowload. The ground, being so light, is easily dug over, and the manure is placed 6 inches or so below the surface; when dug it has to be covered with the cut Hyacinth spikes, or a thin layer of liquid cow-manure; this last soon hardens, forming a thin cake which effectually prevents the sandy soil blowing up into heaps.

October is the month for planting out the bulbs, and I noticed that they were planted deeper than I expected, quite 4 inches, and in some cases they were deeper; this may account for the spikes standing more erect in windy weather without supports than they do in this country. The beds are about 4 feet wide, and seven bulbs of the largest size are planted in a row, eight, nine, and as many as twelve of the smaller sizes go to a row. The beds are covered in winter to protect them from frost and wind, with dried grass or reeds. In March the covering is taken off, and the liquid cow-manure is spread over the surface to prevent the wind disturbing the beds again. In April the flowers are produced—it was quite the last week of the month this year before there was anything like a display of bloom, and in most cases the growers were busy cutting off the spikes before the flowers were fully open; this is done to throw more vigour into the leaves. I was fairly surprised to see such large and handsome spikes. The first sized plants generally produced spikes as large and handsome as we see at the metropolitan exhibitions, but it did not follow that these varieties with the largest spikes would produce them of such large size the next season. At the time of planting a few bulbs of other varieties may get mixed up in a bed of a particular sort; these "rogues" are all marked by some of the members of the firm; they do not trust it to the ordinary workmen. There are really few insect pests which attack the bulbs or the flowers. Rats are troublesome, so also are mice; but the first named do most mischief; they work under the covering of reeds during the winter, burrowing in the beds, to scratch out and destroy the bulbs. I noticed, also, in many of the gardens that round holes, about 5 inches in diameter, had been scooped out in the beds, and where a hole had been made a plant had been taken away. These are bulbs affected with a fungoid disease, which causes the bulb to decay; but if the bulb with the adjoining soil is removed, the disease goes with it, whereas if it is allowed to remain the disease is left in the soil, and it would spread over a circular space about 5 feet in diameter next year, destroying the bulbs all over the space. The diseased soil is thrown over the grass fields.

The process of propagating Hyacinths is very interesting, and is performed in two ways. The largest number of bulblets is produced from those bulbs that have the base scooped out. One large bulb that had undergone the process of scooping out was shown to me, and it had about sixty bulblets, all crowded together, and bulging out from the base of the parent bulb. The other process is merely to notch the base of the bulbs by cutting three times deeply into the rootstock. This process does not produce so many small bulblets—from twelve to twenty-four only—but they are larger, and do not take so many years to grow into large flowering bulbs. The largest bulbs are used for propagating purposes. The small bulblets from scooped out rootstocks take six or seven years to grow into full-sized bulbs; the notched bulbs four years. The small bulblets are planted very thickly in the beds, and merely produce one or two narrow leaves the first season.

Several growers are also seedling raisers, but there are so many good varieties now in all the colours that it is very difficult indeed to produce a superior new variety. In one garden I counted about 1500 seedlings in flower, and the grower had marked three to grow again, but I am very doubtful whether any of them will be introduced to cultivation. This large bed of seedlings represented a considerable outlay. There are new or little known varieties in all the large bulb gardens, and some exceedingly choice

things have been obtained from sports. One of the most sportive varieties is Charles Dickens, single blue; it has sported to single pink, single purple, double blue, and double red. The single pink and double blue forms are plentiful and very good; the double blue Van Speyk is an excellent variety in itself, and has the largest bells of any Hyacinth. I found a rose-coloured form of it, Lord Wellington, a handsome double red, has sported to blue, and of this some growers have large quantities. The single blue Lord Byron has sported to white; it is not quite white, but has a slightly blue tinge, and is very lovely. Baron van Tuyl is also well known as an excellent dark blue Hyacinth; there is a white form of it now grown in large quantities—thousands in one garden; it has also given a pink variety.

Amongst new varieties raised from seed I saw a very large quantity of a distinct orange-buff variety named Orange Above. It was in the hands of one grower, but has since been sold by auction in the green state, and will be distributed during the season at a reasonable price. It forms a handsome spike of well-formed flowers. It would perhaps be invidious to particularise any of the growers, large or small, for I found each grower would excel in some one particular variety or varieties; perhaps one garden would grow *La Grandesse* remarkably well, but be not quite so strong in *Mont Blanc*; another might reverse this. Probably the real cause is, that one grower has a larger stock of a particular variety, and makes an effort to excel in its culture. One firm I would like to mention, because they are well known in Holland, if not in England, as raisers of new varieties from seeds—Messrs. J. H. Kersten & Co., of Haarlem. I have noted nearly all the new Hyacinths grown and exhibited in England for the last twenty-five years, and in that time very great progress has been made, during the last decade some very fine varieties have been produced, and it was both interesting and instructive to see most of them growing in Messrs. Kersten's garden and other fine things yet unknown in England. *Queen of the Blues* (Kersten)—for there are two varieties: this form gives compact spikes, and well formed bells of greater substance than the other form. Challenger is very distinct, and forms a medium spike of deep blood-purple coloured flowers. Mrs. Veitch, blush, has large well formed bells, and a handsome spike. Criterion, yellow, forms a more handsome spike than any other yellow yet in commerce. I noted this as the best yellow exhibited in London this season; it was exhibited before the committee at South Kensington and passed by them: why, I would like to know.

Souvenir de J. H. Veen was very beautiful, its handsome spikes of rich purplish flowers being very conspicuous. *Praaitombe*, single, light blue, handsome spikes; *Pygmalion*, light rosy-lilac; *Roi des Belges*, compact spikes of rosy-scarlet flowers; *Sir Charles Napier*, long spikes of deep blue-purple bells; *Galatea*, very distinct, pale lilacy-rose—large bells and good spike.

Amongst double and semi-double varieties *Disraeli* is distinct and handsome, and will displace *Bouquet Tendre*, which has held the highest position as a double red for fifty years at least. *Venus de Medicis*, double rose, long spike, *Annetje*, semi-double, red—a really grand variety, which may yet displace *Kohi-noor*, forms a handsome spike. *Blush Perfection*, as grown in Messrs. Kersten's garden at Overveen, was surpassingly beautiful, producing semi-double handsome spikes of well formed pale rosy-blush flowers.

La Victoire, double, lilac-purple, is so distinct in character, and the quite double bells form such a handsome spike, that one wonders why it could be passed by the Floral Committee. They should be seen in the clear light in their native Holland. It would lengthen this article too much to write about the Tulips and other fine things seen in some of the gardens, so that I must reserve my notes of them for another article, *J. Douglas*.

TULIPA SYLVESTRIS.

This extremely rare British Tulip is now flowering in its wild state in South Wilts, and deserves passing notice in your columns. As compared with *T. Gesneriana* and our garden varieties, it would be regarded by florists as insignificant, and anything but a grand flower; but irrespective of this it is a real botanical treasure, by reason of its being the only native species belonging to the genus *Tulipa* that we have, and also on account of its being so seldom met with in a wild state. The flowers are of a beautiful golden-yellow, slightly fragrant, drooping in the bud, but almost erect when fully out, and are borne on stems about a foot high, with from one to three linear-lanceolate leaves of a silvery-green colour. In its wild state it appears to be very shy in flowering, as is fully evidenced by the fact of there being only about a dozen flowers out of some thousands of bulbs growing in a piece of woodland, and along a hedge-row, near to where this note is written. Its mode of reproduction is rather noteworthy, and until recently it has always been a puzzle to me to account for its prolific character, seeing that it is so shy in flowering; but in taking up a few bulbs, the other day, all mystery on the point was dispelled. From the base of one of the largest bulbs was growing a thick, white, fleshy root, 3–4 inches long, and at its point a young bulb was already formed. It would be difficult to say how long a time would elapse before it became a flowering bulb, but, judging by appearances, one might say three or four years, under favourable conditions; there can be no doubt, however, that thousands of bulbs come and go out of existence without ever flowering at all. *J. Horsfield, Heytesbury*. [Can our correspondent oblige us with a specimen? Ed.]

QUEEN ANNE'S DAFFODIL.

It is interesting to know that this scarce Daffodil is naturalised in the New Forest. Two years ago a lady, who lives there, sent me flowers of a double Daffodil, which arrived somewhat withered, so I asked for two or three bulbs. These have flowered this year, and are undoubtedly *Narcissus capax*, or *eystettensis*, commonly known as *Queen Anne's Daffodil*. My informant tells me that the Daffodil is wild in her neighbourhood; but there are reasons why the exact spot had better not be indicated. *C. Wolley Dod, Elge Hall, Malpas*.

CULTURAL MEMORANDA.

SCHIZOSTYLIS COCCINEA.

LARGE plants of this late autumn and winter flowering half-hardy perennial may be divided and planted out, in prepared soil, in an open situation, in rows sufficiently wide apart to allow of good growth being made, and watering them to settle the soil. It is a very useful plant, either grown in 48's or 32's, and the flowers are of service in the cut state. The habit of growth of the *Schizostylis*, the formation, colour, and profusion of its flowers, render it an acquisition amongst greenhouse plants, more especially as it comes into flower at a time of year (from October to January) when scarlet and crimson flowers are not plentiful, and it may be grown in the winter by any one possessing a pit or greenhouse. The plants should be potted up in September, in rich mould, watered, and stood on coal-ashes in a cold pit or frame near the glass, and shaded from sunshine for a few days, until the roots have pushed into the soil, afterwards removing a portion of the plants into heat as required, and giving water at the roots when necessary.

PENTAS CARNEA.

This plant deserves to be more extensively cultivated than it now is. It is of a spreading and free-flowering habit, and produces an abundance of moderate-sized corymbs of delicate rose-coloured flowers. It is of easy culture, cuttings strike freely, and it may be grown successfully under ordinary stove treatment, and it is a very useful plant to cut

from. The flowers wire well, and are very suitable for bouquets. The plants may be had in flower nearly all the year by striking in spring and autumn a few cuttings, which, as soon as they are rooted, should be potted singly in 3-inch pots, and thence, when necessary, into larger pots, using a mixture of three parts light loam, one of leaf-mould, and a little sand, placing them on a shelf near the glass, to ensure sturdy growth. They should be stopped three or four times as the shoots continue to grow.

RICHARDIA (CALLA) ETHIOPICA.

Now is the time for dividing, and, if necessary pulling to pieces the plants which have been flowering during the last four or five months. The plants, while moist at the roots, should be divided and planted in rows at from 16 inches to 18 inches apart every way in a mixture of three parts loam and one of well-decomposed short dung. In planting, the plants should be given a gentle shake upwards, to settle the soil among the roots, treading according to the condition of the soil, which, when each plant is being finished, should be drawn back from the stem so as to form a sort of basin for the reception of water. This done, each plant should be staked. The leaves will gradually die down, but not before the roots have pushed into the soil and fresh crowns are being formed. The only summer attention required is to give them copious supplies of water. A note will appear in due time in these columns as to when and how the plants should be potted.

THE ABUTILON.

A stock of this greenhouse shrub is easily raised both from seed sown in light sandy mould and placed in heat, and from cuttings of the young growths inserted in pots filled with the same sort of soil and placed in heat, shading from sunshine until they become rooted, when they, and also seedlings when about 2 inches high, should be potted singly into small 60's, put back in heat near to the glass to prevent them from making a weakly growth, watered, and kept close until the roots have taken to the soil. Pinch the shoots a few times during the first few months of their growth and shift into larger pots as occasion may require. *A. Boule de Neige*, pure white; *A. Darwini grandiflora*, orange and crimson; and *A. vexillarium*, of climbing habit, are some of the best varieties to grow.

CORONILLA GLAUCA.

This free winter and spring flowering greenhouse shrub should be grown by everyone having even a small greenhouse to furnish with a variety of flowering plants which will succeed in a night temperature ranging between 35° and 50°. Cuttings of the young wood taken now and inserted round the edge of small pots filled with sandy soil, watered, and placed in a Melon or Cucumber bed, will soon root, and as soon as they commence to grow they should be potted singly into small 60-sized pots, in a mixture of three parts sandy loam and one of leaf-mould, put into a close frame, watered, and shaded from sunshine until the roots have taken to the soil, when the plants should be aired freely during favourable weather, the shoots pinched a few times, and kept supplied with moisture. Shift the plants into larger pots before the roots become matted in the small ones.

GENISTA RACEMOSA.

This well known yellow winter and spring flowering plant will flourish under the same treatment as that recommended for the *Coronilla*. It is a very useful furnishing plant, as well as being a plant from which you can "cut and come again."

PASSIFLORA CERULEA.

Young plants of this showy and very free-growing and profuse-flowering greenhouse climber are readily raised from seed. Sow at once in a pot filled with any kind of light potting mould, and then place in heat and water, afterwards potting the young plants singly into 3-inch pots, putting them back in

heat, giving water at the roots, and shading from sunshine for a few days until the roots have pushed into the mould, and when about 2 or 3 feet high, plant in their permanent position, putting a little rich mould about the roots. *H. W. W.*

PLANTS AND THEIR CULTURE.

ACALYPHAS.—The bright-coloured foliage of these plants renders them very effective as decorative subjects, and for which purposes medium-sized plants well furnished with leaves to the base are the best. They are of quick growth, and to keep up a constant supply of nice plants frequent propagation must be had recourse to. All the species strike readily from cuttings, and large cuttings should be employed such as the tops of plants which have got leggy, or the points of full sized shoots. These, if potted singly in small pots and stood in a moderately warm propagating pit or frame, will soon root, when they should be potted at once, for if they are left long in the small pots they are apt to make a small set of leaves, which rather spoils their future appearance. Any good light rich soil and intermediate temperature suits them well; but to bring out fully the vivid colourings of the foliage little shading must be employed, nor should they be grown in too close an atmosphere, or they will be deficient in colour, even if they may acquire size. If the plants are carefully hardened off before being used for dwelling-house decoration they will last for a considerable time in good condition. The best sorts are:—*Macafeana*, reddish-bronze and crimson, and some of the leaves are usually somewhat fringed; *musica*—or as it is sometimes called *Makoyana*—is a neat and distinct species. The leaves are many-coloured and slightly recurved. *Macrophylla* produces handsome heart-shaped leaves a foot in diameter, and makes a showy subject for the warm greenhouse, but it is too large for general use; *marginata* is, when well done one of the prettiest of the genus, but from some reason or other it is not so easily grown as most of the others; still, with care, it may also be obtained in good condition. Too much heat, with insufficiency of light and air, seems to be the cause of its not doing satisfactorily in some places. A temperature of 60° without shading and the plants set well up to the glass, are the best conditions for growth. Its brownish leaves, with a distinct rosy-carmine margin and drooping habit, make it a distinct and useful plant. It is one of the best and hardiest. *A. tricolor*—sometimes called *Wilkesiana*—is much in the way of a *marginata*, but sufficiently distinct to be included in a collection with that species.

Acacia and Cytisus.—Few plants require less attention or are better adapted for early winter and spring decorative purposes than these, while many of them are useful in a cut state. Both genera like fairly liberal treatment during the growing period, as their beauty is much enhanced by a free luxuriant growth. Plants which were cut back as they went out of flower, and have now made a fresh start, should, if they are in small pots, or much pot-bound, be turned out, slightly reducing the ball of roots, and repotted in well-drained pots two sizes larger, using fibrous loam with a sprinkling of bone-dust and soot, and as much sharp sand as will keep the soil porous, potting firmly and providing plenty of space for water. Before turning the plants out of the old pots see that the ball of roots is moist throughout. After being potted the plants are much benefited by being kept in a moister and closer atmosphere for a short time, but little or no shading should be used. When fairly well re-established in their pots, give more air, and towards the end of the growing season stand them out-of-doors in a sheltered and sunny position. It is also advisable to partly plunge the pots in coal-ashes or similar material; this prevents them from getting dried up rapidly, and protects the roots from extremes of temperature, moreover it economises labour in watering. The handsomest *Acacia* perhaps, for a cut flower, is *dealkata*—the *Silver Wattle*—which has slender shoots along which hang racemes of yellow flowers, the silvery pinnate leaflets setting off the flowers to great advantage. This is a capital subject to plant out in a conservatory where space can be afforded it. *A. verticillata* is a tall and handsome species, having

dense prickly foliage and spikes of light yellow flowers. A very similar looking plant is *A. Riceana*, but it is more shy of opening its flowers, and is better suited for a rafter or pillar. Of more moderate growth are *armata*, *Drummondii*, *diffusa*, *affinis*, *lineata*, *cultriformis*, and *pulchella*. The curiously winged branched *A. platyptera* is a neat dwarf-growing plant, and, flowering as it does in the autumn, it is a desirable plant. Of stove species—*sphærocephala* is noteworthy, it having elegant foliage and immense dark-coloured spines. Of *Cytisus*, *racemosus* and *canariensis* are the best known, but *C. filipes* is slender branched and has white flowers. It is worthy of being more cultivated. *Cytisus* are, generally speaking, hardier than *Acacias*, and good results are sometimes obtained by planting them outdoors in summer, and lifting them in the autumn. This method saves labour in watering, and I prefer it to pot culture. *F. Ross, Pendell Court.*

FRUITS UNDER GLASS.

PEACHES.—In some instances the crop from the earliest house will now be nearly gathered. Where this is the case syringe well night and morning to keep the foliage healthy, giving the borders a thorough soaking of water, and avoid the arid atmosphere which some gardeners falsely consider is conducive to the ripening of the shoots. Let the ventilators stand wide open day and night, and by the end of the month, where the roof is removable, as in some instances the sashes may be removed, and any repairs necessary may be done. Trees on which the fruits are approaching ripeness should, if dry at the root, receive a thorough watering with clean water, giving no more until the fruit is gathered. Wherever the foliage is found to shade the fruit from direct sunlight—and without which there will be no high finish—it must be put aside so as to expose the fruits. Discontinue the use of the syringe on ripening fruit, also lessen the atmospheric moisture gradually, increasing the quantity of air given by leaving the top and bottom ventilators partially open at night, and should the weather be chilly use a little artificial heat. A good circulation of warm air is conducive to high flavour, and a moist stagnant atmosphere will ensure badly coloured and insipid fruit.

Succession-houses.—The trees in these houses must receive regular attention in disbudding, tying the shoots, and thinning the fruit, gross shoots being pinched back. Remove every shoot which is not required for fruit bearing or furnishing, and aim at getting the wood which is left well ripened. Give abundance of water to trees swelling their fruits, and in the case of old trees let a little manure be given with the water. Where the drainage is good there is little danger of the watering being overdone. If greenfly should appear, fumigate at once, and give the trees a good washing with the syringe or garden engine the first thing in the morning afterwards.

Packing Peaches.—A word on this subject may not be out of place here. I have tried boxes with divisions, rolling the fruit in tissue paper, and packing between them with cotton wool. This is an expensive and not at all times a safe method; I have therefore discarded it, and substituted bran instead, and confectioners' boxes, which can be bought for a penny apiece. Begin by placing about 1½ inch of bran in the bottom of the box, roll each fruit in tissue paper, and allow them to stand 1 inch apart; fill up with bran, allowing a depth of 1½ inch at the top; fill in between the fruit and the lid. Packed in this fashion they will travel to any distance within the three kingdoms.

Figs.—Where the fruits are colouring discontinue the use of manure-water, and also cease to syringe the trees overhead; promote a free circulation of dry warm air until the crop is gathered, when the trees, whether in pots or borders, should receive a thorough watering with clear water, syringing freely. Trees carrying a heavy crop of fruit, with their roots in a limited space, must have abundance of weak diluted nutriment, the trees being syringed early in the morning and in the afternoon. Allow a temperature of 95° for a short time after the house is closed, letting it fall to 70° by 10 P.M.

Succession-houses.—The trees should have the shoots pinched and the fruit thinned, if large size is to be attained. Do not crowd the wood, or the tendency to fruit shedding in spring will be increased. The same method of packing as for Peaches will be found suitable for Figs. *W. M. Dullie, Luton Ho.*

THE HARDY FRUIT GARDEN.

WALL TREES.—The bloom on Peach and Nectarine trees being now set, the trees will be benefited by a thorough soaking of water, taking the precaution beforehand to prick up the soil in the alleys, if it be hard. When the trees are watered, mulch them with long litter, and they will require no further watering for some few weeks to come. Continue to protect the trees for the present, or "blister" will appear on the foliage. On warm mornings give the trees on the south wall—especially the Apricots—thorough washings with the engine or a powerful syringe. If the dry weather continue, all spring-planted fruit trees will stand in need of water at the roots, followed by a mulching.

Raspberries.—Hoe the soil lightly throughout plantations, and cut off any suckers which are far removed from the stools, thinning out the young canes to the number of six or seven. Autumn-fruiting varieties should have their shoots thinned out, leaving them so that when tied up to the wires they are not crowded, and retain chiefly those shoots which stand close to the wires.

Plum trees are blooming very profusely here, and should the weather continue fine for a few days longer we shall obtain a fine crop of fruit. The birds have disbudded the trees less this spring than usual, which I think is owing to our having syringed the trees with a mixture of soot, lime, and water. *A. Ward, Stoke Edith Gardens, Hereford.*

THE KITCHEN GARDEN.

VEGETABLE MARROWS.—These may now be planted in handlights or frames. The neatest way to grow Marrows is to take out a trench 4 feet wide, 1 foot deep, and of any required length; fill this with long stable dung, leaves, &c. (that have been previously well mixed together for a few days), so as to form a ridge 2 feet above the ground level and 2 feet wide at the top. Holes should be made in this, 8 feet apart, large enough to hold 3 bushels of soil, and as soon as this is warm enough and there is no danger of the heat increasing, the plants may be put in under handlights, two in each place, the remaining portion of the ridge should then be covered all over with soil. If enough plants are not at hand seeds may be put in under the handlights instead. It is a good plan to insert a few pieces of Mushroom spawn in the beds when completed, from which a supply may often be obtained during the autumn after the beds are well shaded with the Vegetable Marrow leaves.

Gravel Walks.—These should now have a dressing during dry weather of one of the weed-killing solutions, which will save labour, and ensure the walks remaining clean for some long time to come. Some persons use salt, sulphuric acid, arsenic, gas-lime, &c.; we find Smith's Weed Killer cheap and effective. After one dressing, according to instructions, the walks keep clean for twelve months without further attention. Whatever is applied should be carefully kept from the Box edgings, grass verges, &c.; this is best done by sloping a board 6 inches away from the roots, and the liquid should not be allowed to go underneath this. Gloves and galvanised water-cans are also necessary.

Seeds.—Sow more Marrowfat Peas, Spinach, Turnips, Late Broccoli, and White Cos Lettuce, and take advantage of any showery weather for planting out Early Celery, Beetroot, Brussels Sprouts, Lettuce, &c. Broccoli, Turnips, &c., should be syringed in dry weather, and dusted with wood-ashes, to keep off attacks of flea, &c. *W. H. Divers, Ketton Hall, Stamford.*

TRADE NOTICE.

DICKSONS, OF CHESTER.

WE are not the only people who will be glad that in future it will not be necessary to ask, which Dickson? In fact, the two large Chester establishments—those of James Dickson and of Francis & Arthur Dickson & Sons—will, on and after July 1 next, be amalgamated into one firm. When two first-class establishments thus become blended into one—the nurseries are already continuous—it will be hard indeed if the consumer does not meet with everything he can require, and that of the best.

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

SUBSCRIBERS TO THE GARDENERS' CHRONICLE who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

W. RICHARDS, 41, Wellington Street, Strand, W.C.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, MAY 22 { Royal Horticultural Society; Scientific, Fruit, and Floral Committees.
THURSDAY, MAY 24 { Linnean Society: Anniversary and Centenary.

SHOWS.

FRIDAY, MAY 25 { Société Nationale d'Horticulture de France: Grand Exhibition (six days).

SALES.

WEDNESDAY, MAY 23 { Lilies and Greenhouse Plants, at Protheroe & Morris' Rooms.
Greenhouse and Bedding Plants, at the Barnes Nursery, High Street, Barnes, by Protheroe & Morris.
THURSDAY, MAY 24 { Valuable Importation of Orchids from Mr. F. Sander, at Stevens' Rooms.
FRIDAY, MAY 25 { Established and Imported Orchids, at Protheroe & Morris' Rooms.
SATURDAY, MAY 26 { Greenhouse and Bedding Plants, at the American Nurseries, Leytonstone, by Protheroe & Morris.

JOHN SMITH
the Second.

A VERY few weeks have elapsed since it became our duty to announce the death of the veteran ex-Curator of the Royal Gardens, Kew, JOHN SMITH *primus*, as we must name him to distinguish him from his successor, was a botanist as well as a gardener, and neither the weight of ninety years nor the sad infirmity of blindness suliced to quench his zeal nor stay his work as an author. JOHN SMITH *secundus*, whose death we now have to chronicle, was appointed as Curator in 1864 under the then Director, the late, Sir WILLIAM HOOKER at a period when the failure of eyesight necessitated the retirement of his predecessor. The second JOHN SMITH came to Kew from Syon, where he had made a name for himself by his success in the cultivation of rare exotic fruits and other economic plants.

SMITH was the first to succeed in flowering the dwarf Coco-nut Palm in this country (see *Gardeners' Chronicle*, February 1, 1862, and figured at p. 189). Previous to going to Syon SMITH was at Alnwick, and before that at Floors, so that his training was throughout in excellent schools, and this was of great assistance to him, when he removed to Kew—where he carried out many improvements, and managed to secure the esteem of both Sir WILLIAM and of Sir JOSEPH HOOKER. A man of good presence and courteous manners, ever willing to oblige, botanists and gardeners alike were under great obligations to him. What was written of him in 1873 was applicable to him to the last:—"On few, if on any gardeners of the kingdom, do greater cares or responsibilities fall than on the Curator of the Royal Gardens, Kew. The duties of the office

are so numerous, the interests he has to serve are so varied, and to some extent, so conflicting, that it requires a man of no common energy and tact to cope with them. To hold the balance between the requirements of scientific, of practical, and of ornamental gardening; to satisfy the requirements of the *diletante* and of the pleasure-seeker, and to discharge the extremely important, but little known, duties in connection with the Colonial botanic and experimental gardens—this is the task Mr. SMITH has to undertake daily." Of late years Mr. SMITH's health failed sadly: repeated attacks, from which recovery seemed a marvel, enfeebled his energies, and necessitated his retirement in the spring of 1886 from active duties.

Since that time, as many of our readers know, material changes have been made in the organisation and staff of the Royal Gardens. After his retirement Mr. SMITH's health improved somewhat, but to those who knew his condition the announcement of his death at Twickenham on the 11th inst., will not be a matter of surprise. The funeral took place in Kew churchyard on Thursday last.

The Temple
Show.

THE bold venture of the Royal Horticultural Society in holding a large Exhibition in the City deserved more success than the weather at first seemed likely to permit. Ultimately, however, the tents became filled with visitors and a grand success seemed likely to be scored, particularly as the show remained open till Friday. The show was held in the Temple Gardens, under two spacious tents, and was, all things considered, truly magnificent. The weather unfortunately was just the reverse, but we can hardly doubt that the public spirit of the exhibitors and the enterprise of the old Society will, indirectly, if not directly be of great service to it. That a Society supposed to be under a cloud should yet be able, time after time, to command such splendid service from the exhibitors is a proof of vitality from which the best auguries may fitly be drawn. As the show is being held while these pages are passing through the press, we cannot attempt to do full justice to what is really one of the most remarkable exhibitions it has been our privilege to witness. On entering the long tent with its fine display of herbageous plants and "market-stuff," the visitor could scarcely refrain from an exclamation of delight and surprise. The Peonies, the cut Tulips from Mr. WALKER, the Narcissus from Mr. BARR, the Lilies and other herbageous plants from Mr. WANE, Messrs. PAUL & SON, and others, the Lilies of the Valley from Messrs. HAWKINS and BENNETT, the Calceolarias from Mr. JAMES, all these, and many more, have been marked for note, but neither space nor time permit us to enlarge upon them. The Australian Apples, and those from Nova Scotia, however, compel incidental notice, as does the exhibition of market produce from the Channel Islands shown by Mr. MONRO, and Australian Mangoes, Oranges, Grapes, shown by Mr. J. B. THOMAS.

The large central tent is filled with Palms, *Dracena Lindenii*, and other decorative plants from Mr. IFFTON, Cinerarias and Mimulus from Messrs. CANTER, Caladiums from Mr. LAING and Mr. MELLEES. Mr. TURNER gains a first prize for Azaleas.

Messrs. PAUL & SON show a group of magnificent pot Roses in splendid style, and Messrs. W. PAUL & SON exhibit a large number of smaller size but excellent quality. Messrs. VETCH show a magnificent miscellaneous group, including well flowered

Bermuda Lilies, *Hydrangea paniculata*, and Tree Peonies, with Japanese Maples and *Cornus sibirica* var. *Späthii*, a shrub with deep coral-red branches and golden variegated leaves. Mr. TURNER and others show *Pelargoniums* very fine, but perhaps not quite equal to what has been seen in former days. Mr. WILLIAMS has a good miscellaneous group, including the singular *Ataccia cristata*. Sir TREVOR LAWRENCE, in addition to Orchids, chiefly *Cattleyas*, *Masdevallias*, and other varieties of great beauty, to be presently mentioned, shows a fine specimen of WARD's variety of *Anthurium Scherzerianum*, *Anthurium mortefontainense*, *Cordylina australis*, the lovely blue *Myosotidium nobile*, and many others. But the greatest triumph is secured in the exhibition of Orchids, the best since the famous exhibition at the first Orchid Conference. Messrs. LOW have a fine collection of *Cattleyas*. Messrs. SANDER & Co. show the curious *Scuticaria Keyseriana*, a new species from the Roraima country, with long pendulous, quill-like leaves, and flowers 3 inches across, the segments with a yellowish ground marked with purple spots and lines. From the same exhibitor comes a fine plant of *Cattleya Mossie* and a noble form of *C. Mendelii*, named *Rothschildiana*, a fine shaped flower with broad rosy-lilac segments, the bold lip with an orange throat, with a clear magenta blotch in front, and an edging of the same colour—a truly splendid variety. The collection of *Odontoglossums* is remarkable for the selection of the choicest varieties. *Cypripediums* are well shown, and include the St. Albans variety of *C. ciliolare*, particularly delicate in colouring; *C. Crossi superbum*, and many others. Mr. CYPRIER had magnificent *Laelia purpurata* and *Cattleya Skinneri*, and Mr. POLLETT make fine displays, and Baron SCHROEDER's collection is wonderfully beautiful and choice, and was rich in *Cattleya Skinneri*, *Miltonia vexillarium*, *Cattleya Mendelii*, and *Laelia purpurata* varieties. The President, Sir TREVOR LAWRENCE, shows a superb collection, including the very remarkable *Lissochilus giganteus*, figured in another column. *Spathoglottis Kimballiana*, with its large yellow flowers and singular lip is shown in a fine example with some remarkable *Masdevallias*, and a host of other things which we must needs pass over.

We are aware that we have not been so sparing of adjectives as it is our duty to be on ordinary occasions, but this new departure of the Royal Horticultural Society is so remarkable, and the circumstances are so peculiar, that a few superlatives are more than admissible. Altogether the display is one which shows convincingly that the Society is amply worthy of that extended support which we heartily hope it will get in the shape of new subscribers. It was pleasant to hear that the Treasurer is hopeful, and provided the earnest co-operation of all horticulturists be maintained, the old Society will once more enter on a career as prosperous as it has been—useful it still is. We may mention that although the bulk of our subscribers cannot see these notes till after the close of the show there are many who may be able to visit the show before it closes on Friday, and we strongly recommend them to do so.

THE GARDENERS' ORPHAN FUND.—A special meeting of the committee of the Fund took place at the Caledonian Hotel on the 11th inst., to assist in carrying out the proposed floral promenade and *file* in the wholesale flower market, Covent Garden, in aid of the above, as mentioned in our columns of Saturday last. Mr. Geo. Deal presided, and Mr.

RHODODENDRON, COUNTESS OF HADDINGTON.
6x6 FEET. GROWN BY MR. J. CYPRER.

[THE PHOTO SPECIALLY TAKEN BY MR. J. MARTIN, EARL, AND MR. J. CYPRER.]

Assbee, the Superintendent of the market, kindly attended. Mr. Deal stated that he had waited upon Sir Julian Goldsmid, M.P., the President of the Fund, who cordially approved of the proposed promenade. It was resolved that a circular should be issued inviting the growers for the market to a meeting at the Hummums Hotel, Covent Garden, on Monday, the 14th inst., with a view of securing their co-operation; and a sub-committee, consisting of Messrs. Deal, Barron, Dean, Herbst, Wright, Wynne, and Richards, were appointed—Mr. W. Richards being the Hon. Secretary to the same—to co-operate with the growers in carrying the proposal into effect. The meeting of the growers took place at the Hummums Hotel, Covent Garden, on Monday evening, the 14th inst., and brought a remarkably good attendance, among those present being Messrs. Hayes, Edmonton; Walker, Whitton; Ouvrard, Child's Hill; Cuthbert, Southgate; Turtle, Wellington; Geo. May, Hampton; Pearce, Hayes; Hawkins, Twickenham; Drost, Kew; Byatt, Hampton; Lindsay, Edmonton; Bannister, Hounslow; Rochford, Cheshunt; Seabrook, Edmonton; Lemington, Child's Hill; Messer, Edmonton; Gregory, Sidcup; Hart, Leyton; Call & Cattaneo, salesmen; F. A. Dickson, Covent Garden, &c. The committee of the Fund was well represented. Mr. W. R. Bourne, agent to His Grace the Duke of Bedford, was called to the chair, Mr. Assbee being also present. The circular convening the meeting having been read, the proceedings were briefly opened by the Chairman, who then called upon Mr. G. Deal, the Chairman of the Fund, to explain its scope and objects, and also the particular matter which had caused the meeting to be called together, concluding by moving the following resolution:—"That in the opinion of this meeting the Gardeners' Orphan Fund is an institution worthy the sympathy and support of all horticulturalists, and those present hereby pledge themselves to render every assistance in their power in successfully carrying out an evening floral promenade and *fête* suggested to be held in the wholesale flower market, Covent Garden, kindly offered for the occasion by His Grace the Duke of Bedford." This was seconded by Mr. E. Rochford, and carried unanimously. The Chairman suggested the appointment of a committee of growers and others to co-operate with the sub-committee of the Gardeners' Orphan Fund in carrying out the details of the promenade, and it was moved by Mr. Hawkins, seconded by Mr. H. Herbst, supported by Mr. Assbee, and carried unanimously, "That the following constitute a sub-committee, with power to add to their number:—Messrs. Bourne, Assbee, Hayes, Walker, Sweet, Poupert, Monro, and F. A. Dickson, with power to add to their number." Several suggestions were thrown out by the growers and others, and referred to the committee. On the motion of Mr. R. Dean, seconded by Mr. F. A. Dickson, a cordial vote of thanks was passed to the Chairman for presiding, and also to Mr. Assbee for his sympathy and support. The committee met at the Hummums Hotel on Friday evening, the 18th inst., at 8 p.m.

HORTICULTURAL CLUB.—The usual monthly dinner and *conversation* took place on Tuesday last, at the Hotel Windsor, Victoria Street, Westminster, where the future home of the Club will be. The meeting was largely attended. Amongst those present were the Revs. E. Handley, W. Wilks, Secretary, Royal Horticultural Society; and F. H. Gale; Mr. John Lee, Chairman; Dr. Masters, Messrs. Consens, Moss, H. Turner, Girdlestone, Walker, &c. The Secretary stated that Mr. F. Rivers, owing to illness, was unable to undertake the subject he had intended to have spoken upon—"Peaches," but that Dr. Masters had consented to take his place and speak on the subject of "Sports," which he did, explaining their nature, and alluding to several causes which might account, in different cases, for their production. Dr. Masters also exhibited a fine series of specimens of Conifers received that day from M. Nandin's garden at Antibes. An interesting discussion followed, and was joined in by the Rev. W. Wilks, Messrs. Cousens, Walker, Lee, and others,

NEW FRUIT AND VEGETABLE MARKET.—Plans for the proposed new market for the City of London are given in the *City Press* for last Saturday (May 12). The site is the corner of Farringdon Road and Charterhouse Street—vacant land owned by the Corporation of London. The main building, as shown in the plans, has an elevation of 30 feet and a central avenue 50 feet, the whole frontage being 150 feet, with a depth of 180 feet, giving about 50,000 square feet area. Mr. PERKINS, Chairman of the Markets Committee, has prepared the plans, which are, we understand, now under the consideration of the Central Markets Sub-committee.

GLASGOW EXHIBITION.—Messrs. LITTLE & BALLANTYNE, of Carlisle, exhibit in Court No. 18, a case in which are placed samples of the seeds required in laying down land to permanent pasture and in rotation cropping. Dried specimens of the grasses are an instructive adjunct to this collection. In another part of the case are displayed a large assortment of Coniferous and other tree seeds, as well as sections of the different woods used in arts and manufactures. A prominent feature of this exhibit is a collection of models of vegetables and roots illustrative of some of the different varieties with which the name of the firm is connected. The planting of the broad border which flanks the Exhibition buildings on the left of the principal entrance has been entrusted to Messrs. LITTLE & BALLANTYNE. The space has been filled with specimens Rhododendrons, large Aucubas, Hollies and Conifers, ranging from 10 to 14 feet in height.

SPRING FLOWERS AT KEW.—The Royal Gardens are very gay just now with Tulips and other spring flowers. The large circular bed at the end of the main walk is planted with a groundwork of white and purple Arabis, yellow Wallflower, white and blue Myosotis, from amid which rise rows of mixed Tulips, the whole edged with white and red Daisies. On the rockery Tulipa Greigi, with its bold orange-red flowers and dark spotted leaves, are very attractive. The young foliage of Rodgersia podophylla, with its singularly shaped palmate leaves of a rich bronzy hue, is very striking.

HIGH-PRICED ORCHIDS.—Some good prices were obtained at the two days' sale of the Selborne Collection of these plants:—*Acerides Pridingii*, £28 7s.; *A. Williamsi*, 50s.; *Cattleya Mendelii* (Selborne variety), £27 6s.; *C. Mossii* Southgateii, £35 15s.; *C. exoniensis*, £31 10s.; *Cypripedium Morganii*, 19 guineas; *Oncidium macranthum*, 17 guineas; *Dendrobium nobile nobillius*, 16 guineas; *Cypripedium acaule superbum*, 20 guineas; *C. callosum*, 21 guineas. Several others fetched high prices.

PARLIAMENTARY BILLS AND THE ROYAL HORTICULTURAL SOCIETY.—The Local Government Bill, and the proposed new Department for Agriculture are matters in which all gardeners are concerned, and in which their interests should be carefully discussed and safeguarded. The numerous complaints about rating and the incidence of taxation, which occupy our columns from time to time, point to the necessity of gardeners of all kinds formulating their wishes; and to enable them to do this, we would urge upon the Royal Horticultural Society at once to take up the question, and prove its utility. Perhaps the drafting of a carefully-worded circular, explaining matters, and calling a public meeting of market-gardeners and others, for their discussion, would afford the best means of ventilating the matter, and offer an excellent chance for the Society to do useful work, and make its influence felt in quarters where hitherto it has been a name and nothing else.

THE IRISH EXHIBITION IN LONDON.—The design and plan of the Irish village to be erected in the garden of the forthcoming exhibition at Olympia are now complete. The village, which will no doubt

prove of remarkable interest to Londoners, is being organised by the Earl of LERTHAM and Mrs. ERNEST HAUT, and will consist of a dozen cottages built and thatched by native workmen in the true Donegal fashion. They will be arranged so as to form a picturesque village street, irregular in plan. In the centre of the street will be seen the "holy well" and a veritable cross brought over from Ireland. At the western part of the village, facing the visitor on entering, will be the ruins of a low Irish tower. The cottages themselves will be occupied by native Irish workers—men, women, and children—who will pass in them their ordinary daily routine of life.

THE BOTANIC GARDEN OF THE UNIVERSITY OF HALLE.—Professor KRAUS has published a pamphlet containing a history of the garden with copious appendices, a sketch of the progress of botanical teaching during the last century and biographical notices of the various Professors and Directors. It is illustrated with portraits and plans. The "medical garden" of the Halle University was founded under the Elector FREDERICK III., in 1698. For the first fifty years and even longer, the garden suffered from want of funds, from poor soil, little and impure water, and other evils, under STAHL, founder of the Phlogiston theory of chemistry, ALBERTI, and others, and was more than once on the verge of ruin. At length it was re-organised under PHILIP CASPAR JENGLIANS as lecturer on botany, and ELIAS BÜCHNER as Director. In 1787 was published the *Icones Plantarum Officialium et rariorum ad vitam impressæ*, and in the appendix Professor KRAUS gives a list of the plates contained in this work, for the reason that they are not included in PRITZEL'S *Index Iconum*. The garden improved in circumstances under JOHANN PETER EBERHARD, who levied a small tax or subscription on each student which was devoted to the maintenance of the garden. REINHOLD FORSTER succeeded EBERHARD as Director, and with the help of Chancellor HOFFMAN and the generosity of FREDERICK WILLIAM III., who on his accession increased the revenues of the University, a larger and more convenient plot of land known as the Prince's Garden, was acquired. It is to celebrate the centenary of the re-establishment of the garden upon a wider and firmer basis that Professor KRAUS has written its history. Under SPRENGEL as Director, the garden may be said to have reached the height of its fame, and its utility from that time steadily increased.

CAN IT BE TRUE?—A popular American novelist writes: "At Kew Jenny revelled in the rare flowers and her interest and delight so touched the heart of the crusty keeper that he gave her a nosegay of Orchids." And this is how history, [fiction], is written. Our experience is that the keepers are not crusty, but that it would certainly be a contravention of the rules of the institution to give away a nosegay of Orchids, and the men are too trustworthy to be guilty of such an offence.

EXHIBITION OF DUTCH BULBS.—A very fine display of these—the second which they have held—is now to be viewed at Messrs. OAKSHOTT & MILLARD'S nursery, Reading, and will remain in good condition during the ensuing week.

FLOWERS AND BUDS OF CONIFERS.—The hot, dry autumn of last year has apparently been favourable to the production of flowers on many of our trees and shrubs. Amongst others, the Conifers appear to be showing bloom abundantly. Canon ELLCOMBE sends us sprays of the elegant *Picea orientalis*, bearing a profusion of its small male catkins. These are formed at, and near the points of the young shoots. Each is of about half an inch in length, of ovoid-conic form, and of a lovely carmine colour, which give the tree a most beautiful appearance. At Kew also, the female cones of *Picea ajanensis* are being produced; these also are of a brilliant crimson colour, contrasting exquisitely with the silvery surface of the leaves. *Picea nigra* is also covered with catkins of similar colour. *Cupressus Lawsoniana* and many of the *Retinosporas*

are also laden with pinkish-lilac flowers, while *Thuja gigantea* is thickly beset with young cones. The leaf-shoots of many of these plants are very striking in their appearance, and as these, with the flowers furnish good characters for the discrimination of the species, and are, moreover, in the case of many species, not figured or described in botanical books, we trust that lovers of these plants may be induced to observe them, and to communicate specimens.

VIOLA PEDATA BICOLOR is in bloom in the alpine-house at Kew. The two upper petals are of a deep purple colour, like a Pansy, while the lower three are of pale lilac.

CLEARANCE SALE OF THE LAWSON SEED AND NURSERY COMPANY (LIMITED).—There are few nurserymen, gardeners, and foresters throughout the country who will not learn with some regret that Lawson & Son, Bangholm Nurseries, Edinburgh, are names which will occupy no place in the annals of British horticulture and forestry in the future. The sale of the entire stock was brought to a termination on Saturday, the 12th inst. Perhaps so extensive a sale of nursery stock never took place in this country before. About 50 acres of valuable and varied stock were put up in 12,000 lots, and the sale extended to fifteen days in all. Buyers were numerous, and prices, if not high, were, under the circumstances, fair. Such a large stock could not be unreservedly distributed without considerable sacrifice. Mr. DAVID MITCHELL, Edinburgh, acted as auctioneer, and successfully kept up the interest of the numerous buyers during the prolonged period of the sale. The nursery was well known in the trade to be a perfect repository of valuable stock, much of which was also rare. The old firm of PETER LAWSON & SON was founded about a hundred years ago, and long enjoyed a pre-eminent position. About fifteen years ago a limited liability company was formed to take over the business, with a capital of £40,000, which was afterwards increased to £56,000. Success has not attended the company, however; and the closing scene in the history of a great business concern was enacted on Saturday last when the last lot was sold. The stock realised on the average between £70 and £80 per acre.

RHODODENDRON COUNTESS OF HADDINGTON.

[SEE SUPPLEMENTARY SHEET.]

Our supplementary sheet represents one of a pair of the above-mentioned beautiful hybrid Rhododendron in the possession of Mr. James Cypher, of Queen's Road Nurseries, Cheltenham, and which doubtless many of our readers will have seen exhibited in his prize collection at Bath, Taunton, and other flower shows. The plant here illustrated, and its fellow, are 6 feet high and 6 feet across, and at Easter last year they bore over 1000 flowers each, which, as in former years, Mr. Cypher found invaluable to assist in meeting the heavy demand for white or blush flowers for church decoration at that season.

Other fine specimens of greenhouse Rhododendrons at Mr. Cypher's are Duchess of Edinburgh, 3 feet 6 inches high; Duchess of Connaught, the same; fragrantissimum, 4 feet by 4 feet; and Gibsonii, 5 feet by 4 feet. All are well furnished plants, which never fail to flower profusely.

The plants are potted in good peat and sand, and are never allowed to get dry at the root, although, of course, a less liberal supply of water is given after the wood is ripened. As soon as the blooming is over the plants are placed in a close, warm house to make growth, and whilst doing so they are well syringed. After the growth is completed the plants are placed outdoors in a shady position, and then gradually inured to bear the full sun, so as to thoroughly mature their growths and set their flower-buds. Before there is any danger from frost the plants are removed to a cool-house.

Properly grown, these Rhododendrons are among the finest of flowering plants; for what can be more

beautiful than the plant here illustrated, or the specimens of *R. Veitchii* and *R. Veitchii kevigata* we often meet with? The Jasmine-flowered section of hybrids which Messrs. James Veitch & Son have done so much for, are equally good and manageable. *R. Countess of Haddington*, which was certificated at the Royal Horticultural Society in March, 1862, is of doubtful parentage, but it is generally supposed to be the result of a cross between *R. Dalhousia* and *R. Gibsonii*.

THE FLOWER GARDEN.

FLOWER BEDS.—Take up Hyacinths, Crocus, Tulips, and other spring flowering plants that are past their best and prepare the beds without further delay for summer flowering subjects. Cut off old flower-stems from Arabis and Myosotis, divide and replant the same in previously prepared beds in the reserve garden. Polyanthus which cannot be left in the beds should be lifted and divided into single crowns and transplanted as soon as they have done flowering. The same remarks are applicable to double-flowered Daisies and several other plants used in spring bedding; replant in rows 6 to 9 inches asunder, well water afterwards, and keep them free from weeds throughout the summer months. A beginning may now be made with the planting out of the more hardy kinds of summer flowering plants, as Calceolarias, Verbenas, and towards the end of the week it will be quite safe to begin with Pelargoniums, but in northern counties it will be advisable to wait a little longer unless in maritime districts.

Bolting Plants.—The tenderer subjects and more forward plants of tuberos-rooted Begonias should now be hardened off in cold frames, to be planted out in June.

Lawns.—Any newly laid turf which is not growing well should be watered thoroughly and then rolled. Plantains and Dandelions on lawns should be destroyed, the first named being lifted with a two-tined hand-fork, and the latter by applying a drop of vitriol to the crown of each plant with a notched stick.

Hardy Perennials.—Prick out into pans, &c., the seedlings as soon as they are large enough to handle, using a similar compost to that in which they were sown. Water with a fine-rose can, and shade from bright sunshine till they have taken hold of the new soil, after which take off the frame lights in the daytime, leaving a little air on at the back of the frame all night. *J. Horsefield, Heytesbury.*

FOREIGN CORRESPONDENCE.

VEGETATION IN THE EAST OF FRANCE.

It may interest some of your readers to compare notes as to the relative condition of vegetation in France and Britain, after the very late and cold spring experienced in both countries. In this department, until about a fortnight ago, the weather continued very cold and unseasonable, and in consequence vegetation in general was in a very backward and unsatisfactory condition. Since then, and particularly during the past week, there has been a sudden and welcome change, the weather now being warm with bright sunshine. During this latter period the aspect of the country has undergone a complete transformation. Previously bleak and bare in appearance, it is now clothed in all the beauty and freshness of early spring. Limes, Poplars, Chestnuts, and various sorts of Platanus, are in full leaf, and the Elms, &c., are rapidly following suit. The fresh green foliage of these trees, undimmed as yet by the heat and dust of summer, interspersed with numerous Plum, Cherry, Pear, and Peach trees in full bloom, dotted singly, and in clumps by the roadsides, in the fields and cottage gardens, and over the Vine-clad hill slopes, combine to make a picture of indescribable loveliness. The hedges also, which, in this part of France, form the almost universal divisions between the fields, are full of *Prunus spinosa*, which is a mass of snowy blossoms. In the meadows the golden Cowslip is springing in countless myriads, and in marshy parts large patches of

Caltha palustris add their quota of colour to the picture.

While walking through the public park of this fine old town (Nancy), on Sunday amongst the gay crowd which the bright sunshine and warm air had tempted forth, I noted the following shrubs in flower:—*Pyrus japonica*, in clumps in the open, covered with bloom; large clumps of Mahonia, edged with broad bands of blue Myosotis, made an effective display; and in the shrubberies double flowering Cherries and Prunes of sorts showed charmingly, as likewise Forsythia viridissima. In the centre of a gently sloping lawn was a magnificent clump of *Magnolia speciosa*, a sheet of bloom. The Lilacs are just about to burst into flower, and they will be fully expanded in a few days should the warm weather continue.

The flower-beds were bright with Myosotis, Wall-flower, Pansy and Polyanthus. Tulips were also making a good display, but the Hyacinths were past their best.

Preparations for the summer display have already commenced: beds of Fuchsias have been planted out, also *Aralia Sieboldi* and large specimen Palms and Cordylines. *Jas. Wilson, Nancy, May 9.*

FRUIT GROWERS OF HAMPSHIRE.

A MEETING of market-growers was held at the New Inn, Salisbury, on Saturday, May 5, Captain Turner-Ireton in the chair. The meeting was a large and enthusiastic one. Among the many present were Messrs. Southam, Edy, Davis, Lynne, Hoare, Taylor, and Mr. J. B. Thomas, from London.

The Chairman, in opening, drew attention to the desire felt among the growers to know how to procure better returns, and said he thought Mr. Thomas could tell them something of interest, from which they might derive some benefit.

Mr. Thomas said:—The objects you have to consider are embraced in the one great object of realising better nett returns, and the question is, how to secure that result. One of our friends proposed a company with an appointed agent. Many of you know and have tasted the benefit that often is the fortune of original shareholders in companies, and no doubt have anticipated my recommendation not to invest a single penny in any company for such a purpose. I can quite understand the feeling of many who desire some change from the insecurity that has so long existed; and in order to make yourselves comparatively safe, unity is wanted. For that purpose you might form yourselves into "A Fruit Growers' Protection Association," with a small annual subscription.

The selection of markets, and salesmen at those markets, will require the consideration of a committee, who should advise for the best, from time to time as occasion may arise. This done to your satisfaction very little remains beyond the question of railway rates, and this is a very heavy matter to take up, more especially as the railway company thinks the growers' deputation lately before them accepted their concession as final for a very long time to come. It is a point requiring care, attention and perseverance, to obtain from the railway company that which you are entitled to. You are (to my mind) entitled to rates equal, if not less than those for longer distances. On the passenger rate you have gained I may say nothing, unless you consider it a gain for packages from 18 lb. to 25 lb. Excepting, during the first weeks of the year, are any of these under 25 lb.? And even during the first week will the number of such packages from 18 to 25 lbs. exceed 200 or 300? If not, you will see that the concession means 200 or 300 threepences. You have certainly gained a concession on small packages sent as luggage, but if you will accept my advice, not a single consignment under 84 lb. should be sent by luggage trains.

As for the reduction in the tonnage rates, that should have been secured five or six years ago; but as we have waited so long the reduction should be

in keeping with rates for longer distances that have been in existence for years. Another omission—Strawberries were the only fruit taken into consideration by the company or asked for by the deputation who lately waited on the company, whereas some of the larger growers are already largely interested in other kinds of fruit, and ere long many more of you will of necessity follow suit. As Strawberries will not grow on the same ground continuously, your future rather than the present requirements should have your consideration.

On this question I lately wrote to Mr. Scotter. A few extracts will set before you more clearly my views:—"Your aim should be to incite an extension of fruit-growing on a large scale by substantially lowering the rates, and your concession must be in a reduction of tonnage rates, that will compare favourably with those for longer distances. 'Passenger,' for all fruits not to exceed 40s.; and 'luggage,' 2s., to include delivery; and a further 3s. 4d. on ½ ton lots."

Now this I feel almost safe in saying the company will grant, for the reason that the rate from Portsmouth is only 40s. at passenger, and at luggage rate it is less than 20s.

Another point. Strawberries from St. Malo pay at the rate of 5s. per fast mail boat, and by passenger train or special fast; and I submit that the proportion for sea freight from St. Malo to Southampton, loading and unloading from steamers, dock dues, &c., should be taken at not less than 15s., leaving 40s. as the transit cost from Southampton to London. This is a question that should not be lost sight of by your members of Parliament, especially when we observe that at frequent meetings of our railway companies they continually declare their intention of retaining their right to make special low rates for the foreigner which now do so much injury to our home producers. I should be sorry to say anything against free trade, but I certainly do protest against a subsidy for the foreigner.

In quoting from your local paper this week respecting the Railway Rates Bill:—"Lord Jersey's addition to the measure carried by the House of Lords lays it down imperatively and irrevocably that the traffic rates shall be the same for England as for foreign. A deputation from Southampton waited on Sir Michael Hicks Beach, to point out the effect of this amendment. Michael Hicks Beach, however, does not believe the amendment will preclude railway companies from offering special rates for the carriage of sea-borne produce, which cannot be produced in this country." On this point we as English producers should be in perfect accord, but then he (Sir Michael) advised the deputation to influence M.P.'s to vote against Lord Jersey's proposal when before the Grand Committee, thereby entirely ignoring the English producer's interests.

Railway companies compel you to sell to them your land, and then give to the foreigner preferential rates for that kind of produce which you grow, and thereby assisting to glut your markets, damn your trade, and spoil your prices.

I saw Mr. Scotter for a few minutes on my way here to-day. He at first met me with a decided refusal to open up again the Strawberry rates, and was full against encouraging the passenger traffic, because it entailed so much work, and was not so profitable as if the goods were sent by luggage train. I certainly thought this showed a lack of interest in the growers. The St. Malo rate he declined to discuss, as that was a question that touched the "Rates Bill" now before the House. But when the Portsmouth passenger rate of 40s. was pointed out, Mr. Scotter certainly expressed a desire to have time for further inquiry. The question of a uniform rate, applicable to all fruit, I also placed before him, and I am pleased to say he showed a readiness to do what he could to meet it, with the understanding that I should hear from him in the course of a few days, so the proposition, intended to lay before you I consider will be best held over for the present.

There are two other matters referred to by a

brother salesman, upon which you may expect me to make some remarks, viz., size of punnets used, and new boxes. As regards boxes, I do not agree with the proposition, because it means a large additional expense, without obtaining adequate returns; besides our country buyers would avoid purchasing goods in a box that was returnable. The present method adopted is, to my mind, the one most suitable for the trade, it being of small cost, and very easily adjusted by growers, salesmen, and buyers; but the matter of undersized punnets has done and is doing a very great amount of harm. The remedy rests with yourselves. Another matter which often acts against a grower's goods is that of dividing his consignments between two or more salesmen, as by so doing you create a rival for the sale of your own produce.

I certainly do not advise one salesman for all growers, but I do advise one grower's goods to be sent and sold by one salesman in any one market.

As to the rates charged for small packages "per luggage" it is misleading as to each charge as tabulated must be added 4d. for delivery, which for 56 lb. would be 1s. 4d. being a penny dearer than the fixed rate "per passenger."

Votes of thanks to Mr. Thomas and the Chairman closed the meeting.

PINUS HALEPENSIS.

In order to complete the illustration of *Pinus Halepensis* we now add a figure (fig. 84, p. 629) of the male catkins of this singular species, of which the cones were figured in the *Gardeners' Chronicle*, November 1, 1884. The colour of the catkins is dusky orange, while the anther crest is suborbicular, and somewhat truncate at the edge. For further details relating to this Mediterranean Pine we refer to the former article.

HOME CORRESPONDENCE.

A NEW VEGETABLE.—Fruited by the elementary knowledge that the Cruciferæ are harmless to the eater, I was bold enough to try a salad of the Hoary Cress (*Lepidium Draba*), or Chalkweed, which agriculturists in Thanet and further afield are, to their cost, well acquainted with, it being one of the greatest weed-pests in these parts. The salad was, I admit, scarcely satisfactory; the Cress was too "Cabbagey" and strong. I now have tried the weed boiled and served as a vegetable, and am astounded at its excellence. It suggests Spinach, and Asparagus, too, is present to the palate, but the general flavour, substance, and succulence are altogether unimpeachable. The history of this Chalkweed is not without interest. It is not indigenous, having, it is believed, been brought hither from the Low Countries, unconsciously doubtless, by our soldiers returning from the unfortunate Walcheren Expedition in 1809. The troops landed at Ramsgate, and from that point the weed has spread all over Thanet, and has now even reached the suburbs of London, following principally the main lines of traffic from this south-eastern corner of England. I am not sure that it might not be developed by cultivation into something even better than it now is for edible purposes, but in its present wild condition it is certainly excellent as a vegetable. Could you inform me why the plant has taken so kindly to the chalk soil of south-eastern England? If I am right, there is no chalk land in the region whence it came to Britain. Probably this is an instance, common as to both flora and fauna, where the deportation has resulted in the placing of the plant or animal in a habitat vastly more favourable to its multiplication than the one it occupied originally. If there should be a run on this new vegetable in Covent Garden, I can guarantee a supply from this region, where the farmers would welcome its transfer to orderly cultivation. *Charles R. Haig, Birchington Bay, Thanet, May 5.* [*Lepidium Draba* is a native of the greater part of Europe, and consequently is not particular as to soil. Like many other aliens it has gained a footing here, and evidently finds a calcareous soil suitable to its requirements, and, like the Waterress in New Zealand, the Artichoke in the Pampas, gets the upper hand of the native vegetation. With regard

to its use as a salad, we suggest to our correspondent to cultivate it and bleach it, after the fashion of Sea-kale, also a maritime weed, and then let us know the result. Ed.]

LAPAGERIA ALBA FROM SEED.—Referring to "R. D.'s" remarks (p. 180), wherein he states that he has never heard of the above being raised from seed from the white variety, I may state that a few weeks ago I saw a very fine plant with several well-ripened seed-pods, and also some seedlings raised from some of the seed at Richard Shackleton's, Esq., Withwell Hall, near Chorley. I should think there were several hundreds of seeds upon the plant. *F. C. E.* [Pure white flowers have, we believe, as yet not been raised from seed. Ed.]

RAILWAY RATES OF TRANSIT.—In your paper of May 12 I find these words, "The home growers desire an increase in the railway rates for carriage of foreign articles." Allow me, as one who has in and out of Parliament, for years taken a great interest in this question, to give this statement a most unqualified denial. We ask that the rates for home and foreign produce should be equal. Whether this is done by raising the rates on foreign, or lowering them on home produce, we leave directors to decide; of the two, we should prefer the latter. All we ask is that the Acts of Parliament which prohibit in words the granting of preference rates should not be evaded. As to the "shipping interest being ruined," I fail to see how a longer voyage, and consequently greater freight, can injure the shipping interest. Perhaps the writer can explain this. *A Member of Lord Henrick's Committee.*

TROPEOLUM TUBEROSUM.—The Potato Nasturtium (*Tropeolum tuberosum*) is one of the most beautiful species of the genus, and as a late autumn flower for house decoration it is invaluable. In September and October it blooms profusely, and the cut flowers, deep orange-red on long red peduncles, make lovely bouquets, and last in water for many days. I have grown it for very many years continuously, saving my tubers every autumn. The plant has now suddenly failed, not only here, but in the gardens of all my friends, and of several nurserymen, to whom I have applied for a fresh stock. In the autumn of 1886 my gardener dug up and stored nearly, or quite, half a bushel of tubers. Large numbers were planted in the spring of last year, and came up as usual. The plants suffered much from the drought, and flowered but poorly. On digging for the tubers in December not one was to be found. I then applied to some six or eight friends to whom I had given stock and they were all in the same plight as myself: and so with nurserymen. I assume the drought is the cause of the failure. As far as my experience goes neither the growing plant nor the tuber is liable to any disease, or insect enemy. I should be thankful to know where I could obtain tubers. *S. James A. Salter, Basingfield, near Basingstoke.*

LIQUID MANURE WATER (WOOD'S).—Those in search of a really good artificial manure for feeding pot Strawberries and such-like, cannot do better than give the above a trial. It has been used here this year with great advantage for pot plants, and although these were far less strong, owing to the dry season of last year being unfavourable for layering and establishing good runners, the fruit has been quite up to the usual standard of quality, and I attribute this fact to the use of the liquid manure powder. It was applied once a day after, and in some instances before, the fruit was set. It is preferable to use it at every watering at the rate of 1 oz. to 3 gallons of water, than to use it in a stronger solution and less frequently. The powder dissolves readily in hot water. A strong solution should be prepared and kept in an air-tight vessel, and from this the necessary quantity can be added to the water when watering. I have also used it on other plants bearing fruits, which soon showed good results from its use. It is almost free from smell, and has the advantage of leaving scarcely any sediment on the surface of the pots. *G. H. Richards, Ringwood, Sowerley.*

CUT FLOWERS AND TABLE DECORATIONS AT THE CRYSTAL PALACE.—Visitors to the great summer show on May 12 must have felt disappointed, whilst amongst exhibitors it must have been disheartening to see their exhibits melting away as it were before their eyes even before the judges could get round. Where was the awning we usually see

stretched over the tables and which no one can deny, in addition to warding off the sun's rays, helps so much to bring out the colouring of both plants and flowers and so add to the beauty of the exhibition. As it was on Saturday last the sun pouring down on the exhibits as early as 8:30 A.M., exhibitors were almost at their wit's end in trying to seek shelter, some even leaving the tables and getting away amongst the foliage plants; and even then, before the time arrived for the finishing touch, many of the earlier placed flowers and tender foliage had gone off. Splendid boxes of *Maréchal Niel* and other Roses, bridal bouquets, so chaste and lovely when put on the tables in the morning, all told the same tale; and one could hear complaints on all sides, from the late coming visitors that this and that was not worth looking at as they were nearly all dead. One expects to see things of this description go off a bit on one of our hottest days in July, and even then the writer has seen them fare much better with judicious management. It is to be hoped for all concerned that in future some better provision may be made. *An Eyewitness.*

EUCALYPTUS AT WHITTINGHAME.—For the information of Dr. Landsborough, and others who may feel interested in the matter, I have pleasure in forwarding you notes of measurements of the above tree, taken this morning. The height is 63 feet, girth of trunk, 10 feet; and of the four main stems, 5 feet 6 inches, 4 feet 5 inches, 4 feet 2 inches, and 3 feet respectively. I may mention that Dr. Landsborough is not quite correct in stating that it was cut down to the ground in 1869; as a matter of fact it was sawn over at a height of 9 feet, and so remained to all appearance dead for more than a year. In the belief that it was quite dead; they had begun to root it out, and in doing so fortunately observed a young shoot making its appearance, which was followed by others, one of them from just below where it had been cut over. Whatever may be the true name of the tree, I think Dr. Landsborough right in saying that it is not *umrigera*—at least, a young plant of that variety which we have here bears no resemblance to a plant of the same age, raised from our own tree, the leaves of the former being quite green, and of the latter glaucous, as well as being both shorter and rounder. *John Garrett, May 14.* [We have no doubt from the fruit figured on p. 469 that our determination is correct. Ed.]

IVY ON TREES.—Your correspondent, "R. E. I.," evidently does not understand much about the nature of trees, nor of the Ivy which encircles them, for trees are not rendered tender in consequence, neither does Ivy when it is killed relax its hold, as "R. E. I." can easily determine if he will only take the trouble to try it on one or more trees. *W. H. R.*

—As several of your correspondents are asking for information on this question I willingly give my experience and observation, and first I would say that Ivy does no harm to any building provided the walls are in good repair and the spouting round the eaves perfect; and here often lies the cause of all the mischief, the rain running down behind the Ivy and causing the wall to become damp, whereas Ivy itself has quite an opposite tendency and makes buildings much drier and positively thatches the wall against rain and sucks up the moisture from the base of the buildings. The walls of the Castle here are covered with Ivy of eighty years' growth, so that I speak with considerable experience. Ivy ought never to be allowed to grow on any tree unless it shows signs of decay, when, it will for years form a picturesque object, but on healthy trees it is injurious because it binds around the stem and branches—hinders the flow of sap and the proper development of stem and branch. But then is it wise to cut it on trees now? Yes, at once, at the base, and leave it on the stem to die; and before long it will wither and decay, and the tree will get used to the loss of the greatcoat before winter arrives. *J. Rust, Eridge Castle.*

GOLDEN HODGENS' HOLLY.—Allow me to correct a mistake Mr. W. E. Gumbleton has made, where he writes (p. 595) that "the reproduced Golden Hodgens' Holly never originated at Bangholm Nursery, but at Mr. Hodgens' nursery, Co. Tipperary." The statement Mr. G. refers to describes a bright golden-edged sport of *Ilex Hodgensii*, found by me four years ago in Bangholm Nursery, Edinburgh. It has a well defined broad margin of the brightest golden colour, and carries the vigour and constitution of the green Holly with it. There are two other irregularly variegated forms of the Hodgens Holly, one blotched in the centre of the

leaf, which is very liable to return to the original when it succeeds best; this is known as *Ilex Lawsonii*. The other, has a faint and ill-defined dull silver edging, occasionally running out in streaks towards the centre of the leaf, and has not yet, as far as I know, been named, but has been distributed many years. Is not this the Holly Mr. Gumbleton is thinking of? and has he seen the latest or any other variegated Hodgens' Holly? *J. Munro, Upton Nurseries, Chester.*

—We have observed Mr. W. E. Gumbleton's remarks on this new Holly in your last issue. Evidently he has never seen this plant, nor does he appear to know anything whatever about it. *Ilex Lawsonii* has no resemblance to the Golden Hodgens. *Ilex Lawsonii* was distributed by Messrs. Lawson many years ago, and is now plentiful in this country; but the name has never been "dropped." The Golden Hodgens not only originated in the Bangholm Nurseries, but we secured the original plant—which is now in our possession—upon which the sport appeared, along with the "entire stock," at the great dispersion sale of the Lawson Nurseries, and not a single plant has yet been sent out. It is very distinct, and cannot be mistaken for any other variety, and is, moreover, the finest Golden Holly in existence at the present moment. *Little & Ballantyne, Carlisle.*

—Your correspondent, Mr. W. E. Gumbleton, has evidently found a mare's nest. In your last issue (p. 595) he says, "I am sorry to see reproduced the statement about the Golden Hodgens' Holly." &c. The statement he refers to is one concerning a new form of Hodgens' Holly with a golden margin, which was sold to Messrs. Little & Ballantyne, of Carlisle, and is in no way connected with an older form of this Holly which will be found in the Lawson Nursery Company's catalogue from 1869 to 1885 under the name of *Ilex Lawsoniana*, and which also was raised in the Bangholm Nurseries. The variegation of this latter is in the centre of the leaf, and is not so bright or regular as the one in question. Would it not have been better if your correspondent had made himself acquainted with the new Holly before rushing into print with his most erroneous statement regarding a plant of which he knows nothing, the new Holly being entirely different, and superior to any other form of Hodgens' Holly hitherto known? And as the original plant was sold with the stock, the buyers, who are well known business men, do not require any aid, valuable though it may be, from your correspondent as to the distinction between it and the well known *Ilex Lawsoniana*, of which a large quantity has recently been disposed of in this nursery. *Wm. E. Dixon, Bangholm Nursery.* [We have several other communications to the same effect, which want of space precludes our publishing. Ed.]

DESTROYING WEEDS UPON WALKS.—The recommendation of Mr. Horsfield to use arsenic for this purpose is in many ways too dangerous, even though effectual, ever to become generally used. Gentlemen who preserve pheasants would, I feel sure, object to the distribution of such a dangerous poison upon the walks. Having used muriatic acid with most satisfactory results, I can recommend its use as a most effectual and economical plan of removing weeds from walks, and consider there is no more danger and less inconvenience in its application than there would be with boiling water. I used it in the proportion of one to five of water, and found that of this strength it was certain destruction to all vegetation. To sprinkle it upon the walks, an earthenware watering-can is best; but if an ordinary metal watering-can be used every part of it must first receive two coats of best white paint, because on the paint the acid seems to take no effect, whereas without the paint the watering-can is destroyed after being once used. Zinc causes the acid and water to appear as if boiling, and so much heat is generated that the zinc will be found to have disappeared, so that if any vessels but earthenware are used they must first be well painted. *T. R.*

—In your last issue there appear two enquiries as to the best method of dealing with weeds on gravel walks, drives, &c., which at this season of the year are particularly troublesome. As I have had some experience with very weedy and neglected paths, I venture to offer the following suggestions. For a very small garden path, a few kettlefuls of boiling water poured over the weeds will immediately and effectually destroy them. This remedy has the merit of being inexpensive, and for a little path always available. In a large way I should prefer to use

commercial hydrochloric acid, or muriatic acid as it is sometimes called—1 gallon of acid to 50 gallons of water. This is very destructive and complete in its action; it is also very cheap, being obtained as a bye-product in the manufacture of sodium carbonate (common soda). I have also used with unqualified success crude carbolic acid or phenol—1 gallon of phenol to 70 gallons of water. This also is very efficient and lasting in its results, and, diluted to the extent which I have mentioned, it is exceedingly cheap; and I may say there is nothing with which I am acquainted that is so utterly destructive of plant life as either of the above. In applying these solutions it is best to walk backward. The diluted H. Cl. will act but very slightly on the zinc of galvanised watering-pot; it will rust iron quickly, and make clothes and boots rotten. Great care should be taken to thoroughly clean all water-cans, &c., after being used, to prevent injury to other plants. The employment of the above is far preferable to the use of arsenic, which, after destroying the weeds, remains unchanged to be blown about and inhaled by all who frequent the paths, producing the unpleasant symptoms of cold in the head. Its use, therefore, cannot be too strongly condemned. I trust the above suggestions will meet the case of your correspondents and other readers of your journal who may be similarly situated. *W. Chas. Benedict.*

DAFFODIL NOBILIS AND VARIIFORMIS.—Before the season for issuing Daffodil growers' catalogues would it not be well to settle what is true nobilis, as figured by Redouté? The plate given by him does not by any means accord with the plant introduced into commerce by Mr. H. Collins (Collins Brothers & Gabriel) in 1885, and recognised by the Narcissus Committee as nobilis. True nobilis is more the colour of cambricus, but in outline resembling princeps in its best type, with a broadly expanded fringed and lobed rim. I have some bulbs which came from the Pyrenees in a lot of wild pseudos. By wild pseudos I mean those which run so closely with pallidus precox and the bicolor above-mentioned, which are so variable as to exactly fit what Parkinson, at p. 99 of his book, termed "the mountaine bastard Daffodil of divers kinds." If Redouté's nobilis be reintroduced, I would not be surprised to find it in the variiformis section. It is almost impossible to draw the line as to where pallidus precox ends or where this and pseudos meet, so closely do they run together. Again, when the bicolor above-mentioned and *N. muticus* grow in company we get flowers with all the character of the latter, but with fringed and lobed brims, instead of plain. *N. muticus* is a very beautiful Daffodil, in good soil becoming most vigorous, and is very late flowering, appearing in June. Have we true nobilis in Mr. Collins' plant, which is, I believe, the same as that which Mr. George Maw introduced? *W. B. H., Temple Hill, Cork.*

SALESMEN'S COMMISSION.—My remarks respecting salesmen's commission charges, rates of transit for fruit, &c., criticised at p. 531 by Mr. J. B. Thomas, were a summary of what was said by the South Hants fruit growers at their recent meeting at Winchester, and for the statements made, which, no doubt, they have good ground for making, and for which they are responsible, I can hardly imagine that these persons are exhibiting so much indignation without good reason, although it is but fair that the salesman should not be condemned unheard. But there is presented in Mr. Thomas' own criticisms, and what is presented on the preceding page (530), in a paragraph concerning this very subject, what seems to me to be such a contradiction of statement that some explanation is needed. Mr. Thomas says over his own signature that the rate of a salesman's commission is 5 per cent., whilst in the paragraph on the preceding page, which quotes that salesman's own circular, it is shown that Thomas charges commission at the rate of 10 per cent., and although some extraneous matter is added about empties, boxes, &c., it is there plainly stated that 10 per cent. is the commission hitherto charged. The new proposal to reduce that commission to 5 per cent., exclusive of market tolls, shows that the proposal of the South Hants fruit growers to form themselves into an association for the protection of their own interests, and to provide their own salesman, is creating alarm and provoking apoplexy. I do not know what may be the financial status of fruit and vegetable salesmen generally, but those of other articles of food in the public markets seem to find in their vocation that which Dr. Johnson

described at the sale of Thrall's Brewery as "the potentiality of growing rich;" and if the growers of fruit and vegetables throughout the kingdom could have but grown rich too as rapidly as salesmen generally have, they would have no cause for complaint. A market grower's vocation is so hard, so laborious, and so full of anxious care, that it is not possible to withhold from him and his class full sympathy when opportunity offers to give expression to it. I do not think Mr. Thomas has fully grasped the nature of the statements made at the Winchester meeting with respect to the burthen of rail charges. The statements as I read them were to the effect that each box as sent by diverse consignors was charged at 2s. per box, and that a large number of them were packed into the same waggon, each grower's fruit forming a separate consignment. On the other hand, were a truckload of boxes sent from one consignor they would go at tonnage rates, and thus effect a great saving. That could be done, of course, by making the agent of the Growers' Association the consignor. Very likely a stranger setting up as the Association's salesman would find some difficulty in the market in disposing of his commodities, especially if the boycott prevailed, but high-class fruit would no doubt soon find its level in price come from whence it may. If Mr. Thomas' statement on that head be correct, it rather shows that a radical reform in our present system of marketing produce is needed. Possibly the better arrangement would be for public markets to be set up close to the goods depôts of our great London railways, having both wholesale and retail sections. That is a reform which may be brought about when the proposed London County Council is created. Certainly that body will, in the interests of the vast population under its control, be greatly concerned as to the vested and other interests of certain select markets. Whilst upon this subject I should like to refer to just one point mentioned in your fruit supply leader at p. 520, although it presents a tempting theme upon which to dilate. The writer, referring to the superior and much earlier cultivation of vegetables by the Parisian growers chiefly aided by glass, states that the climate of Paris is about the same as that of London, but adds that preference rates and superior train facilities of transit favour the foreigner and handicap our home grower. But this latter objection cannot apply to that army of vegetable producers who work within twenty miles round London, as these do not use the train service appreciably, but send their produce to market in their own waggons. Now there can be no handicapping as suggested. The real competition is found in diverse methods of culture, which may not be referred to here now. *Spade.* [What Mr. Thomas really did say is told by himself in another column. Ed.]

SOCIETIES.

ROYAL HORTICULTURAL.

MAY 17 AND 18.—The heavy rain which began falling on Wednesday, continued on Thursday, the opening day of the City show of the Royal Horticultural Society, which was held in the grounds of the Inner Temple, a spacious bit of ground on which there were erected two marquees, one being about 200 feet in length and 30 feet wide, and the other 160 by 60 feet, both of which were filled completely, so that it may be judged that a capital display resulted, and considering the unpropitious weather there was a large attendance of visitors, including the Lord Mayor and some of the Belgian burgomasters, Mr. Gladstone, Mr. Chamberlain, and many other notables. For once we have the satisfaction of chronicling a well-earned triumph for the old Society, the precursor, we list hope, of many more, and a proof of the good judgment evinced in visiting the City.

As to the exhibition itself it was all that could be desired, the market growers coming forward in a praiseworthy manner, and they alone made a most creditable display, and moreover introduced a novel feature into the exhibition. The grand collections of Orchids formed a show of themselves, and the exhibitors deserve special thanks for allowing their gems to be exhibited, as they had to remain in the tent all Thursday night.

On entering the long tent from the west end the attention was at once attracted by the group of Lilies of the Valley from Messrs. Hawkins & Bennett, Twickenham; there was a group of about seventy bunches of twelve sprays each, arranged as a half circle

in a bank of Maidenhair Fern, and also two bouquets of Lilies, the whole of the flowers being fully expanded, large and pure white; at the back was a row of a cherry-coloured Ivy-leaved Pelargoniums.

Collections of cut blooms of hardy plants were shown by Mr. Poupert, Twickenham, who received the 1st prize for his collection, which contained well grown flowers of Lily of the Valley, Tulips, Anemones, Narcissi, Spiræas, Myosotis, and Doro-nicum, with the sweet-scented Woodruff.

Messrs. Paul & Son, Old Nurseries, Cheshunt, showed in this class a very interesting collection of good quality, including *Arnebia echinoides*, *Epimedium niveum*, *Gentiana acaulis*, *Acer Reitenbachii*, *Kerria japonica*, *Geum minimum*, *Ribes hybridum*, and many other plants of equal interest.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, was also an exhibitor, showing a group mainly of Narcissi, variety being given by various Tulips and Anemones, *Polemonium reptans*, and *Ranunculus amplexicaulis*.

Mr. Jas. Walker, Whitton, Middlesex, had a large collection of Tulips, embracing a great range of

Messrs. Paul & Son, Old Nurseries, Cheshunt, were placed 3rd for an extensive and neat lot of plants, in which were various *Auriculas*, *Arnebia echinoides*, *Epimedium niveum*, *Caltha palustris plena*, *Gentiana verna*, *Doronicum plantagineum excelsum*, *Trillium grandiflorum*, *Violas*, *Primulas*, *Saxifraga Wallacei*, *Euphorbia pilosa nana*, and various other plants of interest.

Mr. J. James, Farnham Royal, Slough, took the 1st place for *Calceolarias*, showing a most satisfactory group of twenty-five, all strong plants and well flowered. A very close 2nd were Messrs. H. Cannell & Sons, Swanley, Kent.

Messrs. J. & J. Hayes, Nurseryman, &c., Lower Edmonton, N., and Mr. H. B. May, Edmonton, N., both contributed good collections of these plants, remarkably vigorous and bright in colour.

Roses were very extensively shown by several exhibitors, and the whole of one side of the large tent, and a portion of the other, was occupied by groups of finely-developed plants.

In the competing exhibits, the best twelve plants in pots came from Messrs. Paul & Son, Cheshunt, whose lot was a very handsome one, the plants large, and laden with flowers of great size; and especially fine were the examples of Cheshunt Hybrid, *Celine Forestier*, *Centifolia rosea*, and *Charles Lawson*.

Messrs. G. Jackman & Sons, Woking Nursery, Woking, were a good 2nd, and showed a fine plant of *Celine Forestier*, and also one of Cheshunt Hybrid; C. Turner took 3rd, with a very pretty lot of smallish plants of good quality, bearing full, bright flowers.

Mr. Rumsey, Waltham Cross, also showed in this class, and his group of well-flowered small plants was highly Commended—a recognition which was fully merited. Mr. Rumsey led for a lot of twenty-four cut blooms, showing a collection of great merit, in which *Souvenir d'Elise Vardon*, *Camille Bernardin*, *Madame H. Jamain*, *Marquise de Castellane*, and *Baroness Rothschild*, were equally good blooms. He was followed by Mr. C. Turner, with very even and bright blooms of *Madame G. Luizet*, *Madame Lacharme*, *Ulrich Brunner*, and *Her Majesty*, the 3rd place being accorded to Mr. J. Walker, Thame, Oxon, who had a row of fine *Maréchal Niel*, as the back row of his box.

Roses were very extensively shown in the miscellaneous section. Messrs. Paul & Son, Waltham Cross, had 17 boxes of cut blooms, about 60 pot-plants which, as may be imagined, made a grand display. *Sappho*, a new Tea Rose described in the Royal Botanic Society's report, was shown, and also many popular sorts, all of which were of excellent character. Mr. Rumsey again contributed, showing a group of twenty-six pot Roses, which were very well flowered; *Magna Charta*, *Victor Verdier*, and *Baroness Rothschild* especially so. Messrs. G. Jackman & Son were showing a collection of twenty pot Roses of fine quality, well-flowered, and very bright in colour.

Orchids.—Of all the sections of the show probably these plants formed the most attractive feature, at all events to many people, completely occupying one side of the centre table of the wide tent. Rarely, indeed, does such a feast of Orchids present itself to the public gaze. Sir Trevor Lawrence, Burford Lodge, Dorking, showed a collection of remarkable interest. The plants were in perfect health, and many of them were extremely rare and valuable, as for instance *Spathoglottis Kimballiana*, which may be compared to a large yellow *Phalenopsis*, and *Lisochilus Giganteus*, the cut spike of which was shown, and of which an illustration is given at p. 617, and full accounts at another page, to which the reader is referred for a full description of this remarkable plant. *Cattleya Lawrenceana*, *Odontoglossum Cervantesi*, rose-coloured variety. Many *Masdevallia* species were shown, especially fine being *M. Harryana majus*, brilliant scarlet; and *M. H. corulescens*.

We are not able to enumerate all the rarities—only a few can be named. There were plants of *Ansellia congoensis*, *Acrides Honlettiana*, *Anguloa Ruckeri sanguinea*, *Acanthophippium bicolor*, the chaste *Dendrobium Triadenium*, a good plant of the brilliant *Oncidium Marshallianum*, *Masdevallia Harryana*, and its varieties, *Sobralia Macrantha nana*, a great improvement on the type, which is too leggy, *Coleogyne tormentosa*, *Cypripedium Dayanum*, and several others. The group had plenty of *Anthurium Scherzerianum* interspersed, which gave a great brilliancy. Baron Schroder, The Dell, Egham, contributed a magnificent collection of remarkably well-grown pieces, laden with flowers, and he took the first place in the competing groups—and justly so. The centre of the group was formed by a large plant

FIG. 54.—CATKINS OF PINUS HALEPENSIS, AND STAMEN. (See p. 617.)

variety, and also a few Narcissus blooms. The Parrot Tulips, which were the chief portion of the exhibit, were very pretty, with their peculiar green markings.

Daffodils were numerous shown by Messrs. Barr & Son, King Street, Covent Garden, who had a fine bank of cut blooms, embracing most of the popular varieties, and interspersed with Saxifrages, Anemones, *Iris pumila coerulesa*, *Adonis vernalis*, *Tulipa cornuta*, and other hardy plants.

For a collection of hardy plants in pots, there was a good competition, which resulted in the 1st place being accorded to Messrs. Collins Brothers & Gabriel, Waterloo Bridge Road, S.E., who showed a good group of large sized plants, among which were *Lychnis vespertina alba*, *Spiræa palmata*, *Geum coccineum flore-pleno*, *Ranunculus aconitifolius*, *Lychnis Haageana*, *Cypripedium spectabile*, *Doronicum austriacum*, and *Spiræas*, *Lupinus*, &c. 2nd, Mr. T. S. Ware, who had greater variety but smaller plants, a group of great merit, including *Primula Sieboldii* (in varieties), *Gentiana verna*, *Saxifrages*, *Spiræas*, *Irises*, *Doronicums*, *Dielytra spectabilis*, *Silene virginica*, *Geum montanum*, *Cypripedium calceolus*, *Aquilegia glandulosa*, and *Dodecatheon splendidum*, altogether a very interesting group.

of *Cymbidium Lowii*, with six spikes of flower, and other conspicuous objects were *Miltonia Vexillaria*, represented by large splendidly-flowered and good coloured varieties, *Cattleya Skinneri*, *C. S. alba*, *Odontoglossum cirrosium*, *O. crispum* in variety, and several good *Masdevallias*.

Major Lendy took 1st, for twelve cut spikes of bloom, having a very pretty lot, including *Epidendrum Wallisii*, *Laelia purpurata*, *Cattleya Skinneri*, *C. Mossia*, *C. Mendelli*, and *Calanthe veratrifolia*, among others.

H. M. Pollett, Esq., Fernside, Bickley, was awarded 1st, for a good group of *Odontoglossums*. *O. Edvardii*, *O. Pollettianum*, *O. Halli*, *O. Wilckianum*; a good *O. Pescatorei*, with vars. of *O. crispum*, were very noticeable, being strong plants, and bearing good spikes of bloom. Mr. Pollett also showed a grand lot in the miscellaneous section: the most conspicuous plants to be noticed were a nice piece of *Cattleya Skinneri*, *Trichopilia lepidia*, *Dendrobium suavisimum*, *Masdevallia Schlimii*, *Cypripedium Swianianum*, and *Oncidium metallicum*.

An extensive group was sent by Mr. F. Sander, St. Albans, in which were a great variety of forms of *Odontoglossum crispum*; we also noticed the new *Scuticari Keyseriana*, with a ground colour of yellow, spotted brown on the sepals and petals, barred with the same colour on the lip; and also *Cattleya Mendelli Rothschildiana*, and very pretty form of *C. Mossia*.

Messrs. H. Low & Co., Clapton, showed a group in which *Cypripedium hirsutissimum*, *C. Lawrenceanum*, *C. levigatum*, *Dendrobium aggregatum majus*, and numerous varieties of *Cattleya Mendelli*, were prominent.

Mr. Cypher, Cheltenham, sent a good group, which was the same as was seen at the Royal Botanic Show on Wednesday.

A few Orchids, chiefly *Cattleyas* arranged with *Adiantum*, were shown by Messrs. H. Page & Sons, Grove Nursery, Teddington.

Pelargoniums were well shown by Mr. C. Turner, who took the leading position for a group of nine show, fancy, or decorative having excellently flowered plants throughout. For the varieties shown reference may be made to the accounts of other shows in this number. Messrs. J. & J. Hayes were placed 2nd, having smaller plants and not so perfectly trained. This last exhibitor also staged a group of fifty plants, receiving the 1st prize.

Zonal *Pelargoniums* were very good from Messrs. H. Cannell & Sons, who had cut trusses of richly coloured varieties; and Messrs. J. R. Pearson & Sons, Chilwell, Notts, showed a similar lot of about thirty varieties. Show *Pelargoniums*, not for competition, were sent by Mr. Hibbert, gr. to W. Clay, Esq., Kingston-on-Thames, who had well flowered specimens.

Azaleas were excellently shown by Mr. C. Turner, who took the first place with handsome, well-flowered dwarf pyramids; Mons. Thibaut, Madame Van Houtte, Madeline, and Etendard de Mandres, Cordon Bleu, and Cheloni, were conspicuous examples; and he also showed several new sorts, the best of which were certificated at the Royal Botanic Society's show.

Various.—For a group of plants from Nurserymen, Messrs. J. Laing & Son, Forest Hill, were 1st with a very well-arranged group of choice, well-grown plants, in which were *Odontoglossum crispum*, *Miltonia vexillaria*, various *Caladiums*, *Begonias*, *Cattleya Skinneri*, *Clivias*, *Azaleas*, *Dracenas*, *Crotons*, &c., the edging being of *Adiantum*. The same firm also sent a handsome group of *Caladiums*, in which was included some of the finest varieties represented by fine specimens; there were *Triomphe de l'Exposition*, *L'Automne*, *Candidum*, *Bosphore*, *Mithridata*, and several others.

Mr. Nicholson, gr. to W. Melles, Esq., Chingford, Essex, also showed a group of these plants but little inferior to those of Messrs. Laing; *Clio*, *Prince Albert Edouard*, and *Lymington* were the best plants.

Messrs. James Veitch & Son, Chelsea, S.W., showed a very interesting collection of plants, consisting of *Lilium longifolium*, numerous varieties of Japanese Maples and tree *Peonies*, which were very attractive, and made a very good appearance, owing to the fine cultivation exhibited by all the plants.

Messrs. B. S. Williams showed a very fine group of miscellaneous plants, in excellent health; *Dracena Lindenii*, *Anthurium Scherzerianum*, *Azaleas*, *Sarracenia*, and a few *Odontoglossums*, with *Atactia cristata* (in flower), were among the chief constituents.

Begonias (tuberous), were shown by Messrs. H. Cannell & Sons, and from Messrs. J. Carter & Co., High Holborn, there was sent a collection of *Cinerarias* and *Mimulus*, both with large flowers, and the plants vigorous.

Mr. Icton, Putney Park Lane, S.W., was awarded a 1st prize for a collection, consisting of fine decorative *Palms* of large size, in splendid health, and *Dracena Lindenii*, and a similar group was shown by Mr. Drost, Kew Nurseries, Richmond.

Market Plants shown in groups of not more than 150 square feet were a strong feature. The first prize was accorded to Mr. J. Sweet, Newbridge, Whitstone, for a varied lot of plants, including *Mignonette*, show *Pelargoniums*, *Erica Cavendishii*, *Chrysanthema coronarium* (a yellow variety), and other greenhouse plants in flower, and a few small plants of *Cocos Weddelliana*. Mr. H. B. May, Edmonton, was second for a handsome group of market Ferns, *Crotons*, &c., with *Asparagus tenuissimus*, an ornamental leaved *Begonia* and a variegated *Ananassa sativa*; *Adiantum* and *Periserae* were the most plentiful Ferns here. There was also another group of miscellaneous greenhouse plants, Mr. Rochford, Mill Lane Nursery, Cheshunt, and which also took 2nd. *Hydrangeas* with large heads, *Rhodanthe Manglesi*, *Mignonette* with *Fiens elastica*, *Dracenas*, small *Arecas*, *Spiraeas* and *Calceolarias*, were the chief constituents. The 3rd was awarded to Messrs. J. & J. Hayes for a group of excellent *Pelargoniums* of the show and zonal types, with *Hydrangeas* and *Fuchsias*. A group of show *Pelargoniums* was also very good in this class from Mr. Braid, Winchmore Hill, N., and also by Messrs. J. & J. Hayes, both having excellent plants, and the latter firm also had a bright scarlet zonal sort, with a few *Calceolarias*, *Fairy Roses*, and good *Hydrangea hortensis* in 48-inch pots, with heads 2 feet in diameter.

Mr. Poulton, Angel Road, Edmonton, had a pretty lot of *Colens*, *Lilium Harrisii*, *L. Candidum*, and *Tuberoseas*, all well grown plants.

Cut Flowers, &c.—These were not numerous. Mr. P. H. Garcia, Central Avenue, Covent Garden, showed a very good bridal bouquet of *Lilium longifolium*, *Gardenias*, and *Lily of the Valley*, and another with *Cattleyas*, *Tuberoseas*, and *Lilies*; also a posy of *Roses*, a wreath of *Arum*, white *Gladiolus*, *Gardenias*, a cross of *Roses*, *Lilies*, and *Eucharis*, and an anchor in the same style, with a band of scarlet *Pelargonium* entwining it.

Messrs. G. Smith & Co., Commercial Road, Pimlico, S.W., had stands of flowers arranged in their patent flower-stand, which consists of a mould in the shape of a dome with holes in it to receive the flowers.

Fruit and Vegetables.—Of these a very fair display was made. Messrs. J. Cheal & Sons, Crawley, Sussex, had a fine collection of thirty dishes of Apples, very well kept, especially Northern Greening, *Gloria Mundi*, *Hanwell Souaring*, and *Wellington*.

Mr. Cummins, gr. to A. H. Smee, Esq., The Grange, Wallington, sent about thirty-five dishes of Apples and Pears, also of fine quality—*Wadhurst Pippin*, *Wellington*, *London Pippin* were the best apples, and *Catillac*, and *Due d'Orleans* were good samples of Pears.

Forty dishes of well kept Apples came from Messrs. G. Bunyard & Co., Old Nurseries, Maidstone, having Dutch *Mignonette*, *Scarlet Nonpareil*, *Gascoigne's Scarlet Seedling*, *Sturmer Pippin*, and *Lane's Prince Albert* among the most prominent samples.

Mr. J. B. Thomas, Covent Garden, exhibited samples of fruit as received for sale at the market. There were cases of *Lee-chees* from China packed much in the same fashion as we see *Tea* in chests; also *Jaffa Oranges*, and *Australian Mangoes*. Of *Apples* Cox's *Orange Pippin*, finely coloured; *Blenheim Orange* and *King Pippin*, *Ribston Pippin*, all from Australia, in excellent condition and richly coloured. From Italy there were also *Apples*; *Nonpareil* and *Golden Russets* were shown in barrels, from America; *Cape Cod* sent large *Cranberries*, like small *Cherries*; *Belgian Grapes* were in small boxes of about 3½ by 7 inches; *Malta Potatoes*, kidney and round, and kidneys from the Canaries, with *Bananas* from Madeira—a very interesting feature.

Mr. G. Munro, Covent Garden, sent samples of *Peas* and *Grapes* as packed in market baskets; and also four baskets of *Melons* from the Channel Islands.

Mr. Vert, gr. to the Right Hon. Lord Braybrook, Audley End, Saffron Walden, sent very finely-

grown fruits of *Strawberries*, *President* and *Sir Joseph Paxton*,

Mr. W. Lohjot, Woodlands Farm, Putney, was an exhibitor of excellent *Asparagus* in three bundles of about 100 heads each: Mr. Poupard, of Twickenham had very fine heads of *Seakale*.

AWARDS IN CUPS AND MEDALS.

For Groups of Plants: Silver-Gilt Banksian Medal to Messrs. Laing & Sons; to Mr. J. Sweet; to Mr. W. Icton; to Mr. H. B. May; to Mr. E. Rochford; to Mr. G. Brand; and a Silver Flora Medal to Messrs. J. & J. Hayes.

In Class 4: For group of Orchids, Baron Schröder a Silver Cup.

Class 5: For group of Orchids, Mr. J. Cypher a Silver-Gilt Banksian Medal.

Class 7: For twelve varieties of Orchids cut spikes, Major Lendy a Silver Flora Medal.

8. Group of *Masdevallias* and *Odontoglossums*—not more than twenty-five plants (open). Mr. H. M. Pollett, Silver-gilt Banksian Medal.

9. Group of *Cattleyas* and *Laelias*, combined or separate group of fifteen distinct (open). Mr. J. Cypher, Silver Cup.

10. Group of twelve *Roses*, in pots (open). Messrs. Paul & Son, Old Nurseries, Cheshunt, Silver Cup; Mr. C. Turner, Slough, Silver Flora Medal; and Messrs. Jackson & Son, Silver-gilt Banksian Medal.

11. *Roses*—twenty-four cut blooms, not less than twelve varieties (open). Mr. W. Rumsey, Waltham Cross, Silver Banksian Medal; Mr. C. Turner, Slough, Silver Flora Medal; and Mr. J. Walker, Silver Banksian Medal.

12. Group of nine greenhouse *Azaleas*, in pots (open). Mr. C. Turner, Silver-gilt Banksian Medal.

14. Group of nine *Pelargoniums*—show, decorative, and fancy (open). Mr. C. Turner, Silver-gilt Banksian Medal, and Messrs. J. & J. Hayes, Silver Banksian Medal.

15. Group of fifty *Pelargoniums*—show, decorative, and fancy (open). Messrs. J. & J. Hayes, Silver-gilt Banksian Medal.

21. Group of hardy herbaceous plants in pots (open). Silver-gilt Banksian to Messrs. Collins Bros. & Gabriel; Silver Flora to Mr. T. S. Ware; and Silver Banksian to Messrs. Paul & Son.

22. Hardy plants—Cut blooms (open). Silver-gilt Banksian to Mr. T. S. Ware; Silver Flora to Messrs. Paul & Son.

23. Group of twenty-five *Calceolarias* in pots (open). Silver-gilt Banksian to Messrs. J. James & Son; Silver Flora to Messrs. H. H. Cannell & Sons; Silver Banksian to Messrs. J. & J. Hayes.

23a. Silver Banksian to Messrs. Poupard.

24. Miscellaneous objects not specially mentioned or provided for in the foregoing classes, Silver Banksian to Messrs. Barr & Son; to W. Paul & Son, Silver Cup for cut *Roses*; to Sir Trevor Lawrence, Silver Cup for group of Orchids; to Messrs. F. Sander & Co., Silver Cup for same; to Messrs. H. Low & Co., Silver Cup for same; to Messrs. J. Vitch & Sons, Silver Cup for same; Silver-gilt Banksian Medal to Messrs. J. Laing, for a group of plants; to Mr. P. H. Garcia, for bouquets and wreaths; to Mr. J. Walker, for cut flowers; to Mr. W. Rumsey, for *Roses*; to Mr. B. S. Williams, for a group of plants; to F. Wigan, Esq., for Orchids; to W. Mellis, Esq., for *Caladiums*; to Messrs. J. Carter & Co., for *Cinerarias* and *Mimulus*. Silver Flora Medals to Mr. H. B. May, for a group; to Mr. G. Munro, for a collection of fruit; to Mr. J. B. Thomas, for same; and to Messrs. Jackman & Son, for *Roses*.

ROYAL BOTANIC.

MAY 16.—The first summer show was held in the gardens at Regent's Park last Wednesday, when, unfortunately, rain fell continually. The show itself was a very pretty one, *Roses*, *Pelargoniums*, and Orchids being excellent, but fine-foliaged plants, &c., were not so grand as usual, owing, no doubt, to the cutting down of the schedule this year.

Orchids.—Mr. J. Cypher, Cheltenham, showed very fine Orchids, and took 1st for twelve and for a collection of *Laelias* and *Cattleyas* in the nurseryman's section. He had very good examples of *Chysis bracteosa*, *Miltonia vexillaria*, *Cattleya citrina*, *Dendrobium nobile*, *Odontoglossum Pescatorei*, *Cattleya Skinneri*, *C. intermedia superba*, *Laelia purpurata nobilis* and *L. p. Archduchesse*, and various other forms. Mr. H. James, Lower Norwood, was 2nd in both instances, and had fine plants of *Cypripedium Lawrenceanum*, *Dendrobium nobile*, *Saccolabium retusum magnificum*, *Masdevallia*

Veitchii, and numerous forms of *Lælia purpurata* and *Cattleya Mendelli*.

Mr. F. J. Hill, gr. to H. Little, Esq., Twickenham, was the best exhibitor in the amateur's section, with good well-flowered plants, of which the best were *Dendrobium thyrsiflorum* var. *Walkeriana*, *Lycaste Skinneri rosea*, *Miltonia flavescens*, *Cattleya Mendelli fimbriata*, &c.

Messrs. H. Low & Co., Clapton, sent a group to which a Small Silver Medal was awarded; some of the best plants were *Cypripedium hirsutissimum*, *C. Sanderianum*, *Dendrobium devonianum*, and several very good forms of *Cattleya Mendelli*, and *Trichopilia suavis*.

Roses.—These flowers formed one of the leading features of the show, and Mr. C. Turner, Slough, carried off the chief prize for nurserymen (for twenty plants), having grand bushes in 9-inch pots: *Marquise de Castellane*, *Madame Gabriel Lujzet*, *Céline Forestier*, *Juno*, and *Ed. Morren*, were specially well done.

For nine plants, the 1st prize was taken by Messrs. Paul & Son, Cheshunt, who had the finest *Roses* in the show; *Centifolia rosea*, *Magna Charta*, and *Ch. Lawson*, were good. Messrs. G. Jackson & Son were good 2nds in both cases, and had fine plants of *Céline Forestier*, *Dr. Arny*, and *Souvenir d'un Ami*. Mr. Turner led again for twelve in 12-inch pots (open), and for the six (nurserymen), with very evenly-flowered specimens of *Mons. Thibaut*, *Madeline*, *Etendard de Flandres*, and *Stella*.

The best amateur group was that of Mr. G. Wheeler, gr. to Sir J. Goldsmid, Regent's Park, who had a very nice lot of low pyramids, *Criterion*, *Stella*, and *Model*, being the finest forms shown.

Pelargoniums were very well represented by Mr. C. Turner, who once again took the leading prizes, being 1st in the open class for *fancies*, and in the nurserymen's for show sorts, having excellently flowered plants in both cases. The *Shah* and *Jenny Howlett* were good *fancies*, and *Martial*, *Emperor*, and *Prince Leopold* were good shows.

Mr. Phillips, gr. to R. W. Mann, Esq., Langley Broom, Slough, was a good exhibitor, taking 1st in the amateur's class for six shows; and he was also awarded a Bronze Medal for a group of *Pelargoniums* not for competition.

Some of the stove and greenhouse plants shown were of excellent quality, Mr. H. James showing the best of the nurserymen, and so carried off the chief prizes. *Chorozeva cordatum splendens*, *Ixora Prince of Orange*, *Erica coccinea minor*, *Boronia pinnata*, and *Dracophyllum gracile* were well shown in this exhibitor's groups.

Among amateurs Mr. Chapman, gr. to J. Spode, Esq., Ruggly, was 1st for the larger lot of ten, showing very creditably *Aphelexis grandifolia*, *Dracophyllum gracile*, *Ixoras*, and *Statice profusa* (good).

The leading exhibit of six ditto came from Mr. A. Offer, gr. to J. Warren, Esq., Handcross Park, Crawley, who had one of the best groups of the show, *Darwinia fuchsoides*, *Pimelea decussata*, *Boronia elatior*, *Chorozeva ilicifolium*, and *Tremandra ericeifolia*, were very well grown and flowered.

The best lot of fine-foliaged plants were (nurserymen) those of Mr. H. James, who took another 1st, with good plants of *Macrozamia Dennisoniana*, *Latania borbonica*, *Asparagus tenuissimus*, &c.; and in the corresponding competition for amateurs the place of honour was taken by Mr. R. Butler, gr. to H. H. Gibbs, Esq., Regent's Park, with a fine specimen of *Pandanus Veitchii*, *Chamaecyparis excelsa*, and *Arca Baueri*. This exhibitor deserved credit for the legibility of his labels, which many exhibitors would do well to copy.

Ferns and Miscellaneous Plants.—Mr. Offer and Mr. Butler took prizes for exotic Ferns in the order named, both showing excellent plants. Mr. Offer had fine examples of *Davallia Mooreana*, *Alsophila excelsa*, and *Marattia elegans*; and he also took a large Bronze Medal for foliage plants, not for competition having good plants of *Anthurium crystallinum*, and of *Bonapartea stricta*.

Hardy plants were good from both Messrs. Collins Bros. & Gabriel, Waterloo Bridge Road, S.E., and Mr. T. S. Ware, Tottenham, who took respectively 1st and 2nd; each had a good lot of well grown and well flowered plants, and ran close.

From Messrs. W. Cutbush & Son, Highgate, a group of various plants was sent, and a Silver Medal awarded; *Lilium*, *Acacia*, *Maples*, &c., were included.

Mr. B. S. Williams received a Large Silver Medal

for a similar group, in which there was a plant of *Attacia cristata* in flower, also *Orchids*, *Sarracenias*, *Cliveas*, *Azaleas*, *Dracenas*, &c.

Messrs. Laing & Sons, Forest Hill, sent a handsome group of miscellaneous plants to which a Large Silver Medal was awarded; *Caladiums*, *Orchids*, *Geonomas*, *Dracenas*, *Cliveas*, &c., tastefully harmonised.

A large exhibit of *Roses* was made by Messrs. W. Paul & Son (Silver Medal), who had both cut blooms and plants in pots; *Sappho*, a new *Rose* (T.), yellow and flushed pink, was very fine; it has a good form, and is likely to prove a useful addition to our lists. *La France*, *Violette Bowyer*, and other popular sorts were also shown. A Bronze Medal was awarded to Mr. J. Walker, Thame, for *Maréchal Niel* *Roses* of large size and good colour.

Messrs. J. Carter & Co., High Holborn, W.C., showed *Cinerarias* and *Mimulus*, both large and of bright colours.

To Messrs. Barr & Son, Covent Garden, W.C., a Bronze Medal was given for a group of *Narcissi*; including many popular varieties, and a new one called *N. poeticus grandiflorus*, a large-flowered form.

FLORAL CERTIFICATES.

Azalea Theodore Reimers, rosy-purple, double (C. Turner).

Azalea Louise Vervaeue, white, green centre, semi-double (C. Turner).

Azalea Vervaeuiana (C. Turner).

Azalea Ami du Cœur, soft rosy-red, double (C. Turner).

Rose (Tea) *Princess Beatrice*, yellow, flushed with pale pink (Bennett).

Rose (Tea) *Sappho*, yellow, slightly suffused with pink (W. Paul & Son).

Narcissus poeticus grandiflorus, a large form, cup yellow, with prominent full-coloured margin (Barr & Son).

Genm. minutum, 1 foot high, flowers rich orange-scarlet, 1½ inch in diameter (Paul & Son).

Mimulus Jubilee, large flower, ground cold yellow, red-brown lobes, with a yellow margin, throat spotted brown. (J. Carter & Co.)

Begonia Mrs. F. W. Bennett, double, yellow, round (H. Cannell & Sons).

Begonia Enchantress, double, flesh, prominent guards (H. Cannell & Sons).

Begonia Lady Mary Fitzwilliam, double, bright rose centre, guards paler (H. Cannell & Sons).

Gloxinia Madame Bleu, lobes red-purple, white edge, spotted throat (Laing & Sons).

Olive Orange Perfection, rich red-orange, yellow centre, large truss (Laing & Sons).

Clivea sulphurea, pale salmon-pink, pale yellow centre (Laing & Sons).

Caladium Comte de Germiny, light red, dark nerves, very pale spots (Laing & Sons).

Caladium Charlemagne, light red, dark nerves (Laing & Sons).

Myosotis undulata grandiflora, a large flowered form of *M. dissitiflora* (H. J. Virgo).

BOTANICAL CERTIFICATES.

Anthurium Scherzerianum sanguineum, a broad leaved and spathe form (H. James).

Lælia purpurata *Archduchesse*, sepals and petals slightly tinged rose; lip dark, lighter in the centre lobe (J. Cypher).

Lælia purpurata nobilior, sepals and petals white lip as above (J. Cypher).

CRYSTAL PALACE.

MAY 11.—The show held last Saturday was rather disappointing, exhibitors not coming forward freely, and in many classes there was only one entry, which is a great falling off from last year. The various exhibits were placed at wide intervals, so that about three-parts of the entire length of the building was occupied by the groups, &c., and the full effect of the plants and flowers was consequently diminished, but crowding by the visitors was thus avoided, which was desirable, as the attendance was good.

Roses were shown best, and Messrs. Paul & Son, Old Nurseries, Cheshunt, showed a group of excellently flowered bushes in pots, securing the leading position in the open class. *La France*, *Innocente Pivola*, *François Levet*, *Jean Ducher*, *Alba rosea*, *Violette Bowyer*, and *George Morreau* were specially fine plants; Messrs. G. Jackson & Son, Woking Nursery, Woking, were a capital 2nd, with *Mdme. Lacharme*, *La France*, *Marquise de Castellane*, and *Ferdinand de Lesseps* as his best examples. Fol-

lowing very closely was Mr. C. Turner, Royal Nurseries, Slough. This last named exhibitor came up well in the class for nine show *Pelargoniums*, and also for nine fancy varieties, taking 1st without any competition. Mrs. Langtry (white, with rose spots), Miss E. Little (rose, with darker markings all over, very dark spot, and white margin), were good in the latter section; and in the former were *Emperor of Russia* (dark black-purple with a white margin), very fine; *Maid of Honour* (rose-pink and white, with red spots), *Triomphe de St. Maude* (rich carmine, black spot), were the best of the *fancies*. The same exhibitor also took 1st in the class for eighteen show and decorative.

In the amateurs' division the leading prize for both sections was awarded to Mr. D. Phillips, gr. to R. W. Mann, Esq., Langley Broom, Slough, who showed well—of *fancies*, *Irene*, *Vivandière*, and *The Shah*: of show sorts, *Mauve Queen*, *Kingston Beauty*, and *Prince Leopold*.

The best *Azaleas* in the show were those of Mr. Turner, who therefore secured more successes, showing some finely grown and well flowered large pyramids, and also capital plants in 9-inch pots: *Jean Vervaeue*, *Stella*, *Duc de Nassau*, and *Comte de Flandres* all fine examples; and this exhibitor also showed *Azalea Stella* as the best specimen greenhouse plant.

Messrs. J. Laing & Sons, Forest Hill, sent a magnificent group of specimen *Caladiums*, candidum being a fine plant, and so also were *Triomphe de l'Exposition*, *Chio*, *Luddemanni*, *Ferdinand de Lesseps* and *Sanchoniathum*. This firm also contributed a tastefully arranged group of plants, arranged for effect in 200 square feet, in which were included *Dracena Lindenii*, *Azaleas*, *Cliveas*, *Caladium argyrifolium*, *C. minus rubescens*, and numerous *Orchids*, as *Cattleya Skinneri*, *Odontoglossum crispum*, &c.

Several prizes were taken by Mr. H. James, Castle Nursery, Lower Norwood. He was 1st for nine *Orchids* in flower, showing a capital piece of *Cypripedium Lawrenceanum*, with forty flowers; *Dendrobium thyrsiflorum*, with twenty racemes; *Cattleya Skinneri*, *Dendrobium nobile*, &c. He also showed this last plant as the best specimen *Orchid*, taking 1st, and also for the best fine-foliaged plant, and he came 2nd for a stove plant, where Mr. W. Chapman, gr. to J. Spode, Esq., Sydenham, was 1st, with a large well-flowered plant of *Ixora regina*. Mr. Chapman was also 1st in the open class for nine stove and greenhouse plants, and again in the amateurs' section for six, showing capital specimens in each case. His finest plants were *Ixora Dixiciana*, *Tremandra ericeifolia*, *Statice profusa*, and *Hedera Darwinii*.

Mr. Cooper, Sydenham, had the best *Orchids* of the amateurs, showing *Lælia purpurata*, *Cattleya Skinneri*, and *Miltonia vexillaria*, in good form; Mr. F. Hill, gr. to H. Little, Esq., Twickenham, was 2nd, having a plant of *Miltonia flavosa*.

Mr. Offer, Handcross Park Gardens, Crawley, took numerous prizes, being 1st for nine fine-foliaged plants (open), with good specimens, and also for six in the amateur section, and again for Ferns. Mr. Penfold, gr. to Rev. Canon Bridges, Biddington, also was a successful exhibitor of *Crotons*, *Dracenas*, and Ferns, in which latter class he had good plants of *Dicksonia antarctica*, *Asplenium nidus avis*, and *Microlepia hirta cristata*.

Table plants were excellent from Mr. Hudson, Gunnersbury House Gardens, Acton, who had remarkably sturdy, healthy plants of *Pandanus Veitchii*, *Dracenas* in variety, and *Aralias*, &c.

Special prizes were offered by Messrs. Carter for *Cucumber Model*, for which there was only one entry, Mr. G. Collins, gr. to J. A. Rose, Esq., Wandsworth, taking the 1st prize, for well grown samples.

Messrs. Sutton offered prizes for *Gloxinias* and for *Cucumbers*, which brought a fair show, Mr. J. Hopkins, gr. to M. Jacoby, Esq., Gipsy Hill, leading for *Gloxinias*, and Mr. Monk, Dulwich, for the *Cucumbers*, showing good fruits of *Improved Telegraph*.

Mr. W. Rumsey, Waltham Cross, staged a good collection of cut *Roses*, including many popular varieties, such as *Madame de Watteville*, *Charles Lefevre*, *Niphotos*, *Maréchal Niel*, *Souvenir d'un Ami*, and *Lady Mary Fitzwilliam*; and Mr. H. Bennett, Shepperton, sent a collection of his *Roses* *Lady Mary Fitzwilliam*, *Little Dot* (*Polyantha*), and *Princess Beatrice*.

Calcopolarias and *Mignonette* were well shown by Messrs. Cannell & Sons, Swanley, Kent; and Messrs. Barr & Son, Covent Garden, and Mr. T. S. Ware, Tottenham, each showed a collection of *Daffodils*, &c. *Madame de Graaff*, large *Sir Watkin*, various forms of

Leedi, and J. E. M. Camm were good in Mr. Bari's lot. Mr. Ware had numerous forms of *Poeticus*, and also showed *Ranunculus amplexicanlis*, Tulips, *Primula Sieboldi*, &c.

LINNEAN.

MAY 3.—Dr. John Anderson, F.R.S., Vice-President, in the chair. The following were elected Foreign Members:—Dr. A. Engler, Prof. T. Fries, Prof. R. Hartig, Dr. E. Warming, and Dr. A. Dohrn.

The Chairman announced a resolution of the Council to found a Gold Medal to be called "The Linnean Medal," to be awarded at the forthcoming anniversary meeting to a botanist and zoologist, and in future years to a botanist and zoologist alternately, commencing with a botanist.

Dr. Francis Day exhibited some specimens of Lochleven and sea trout raised at Howtown, to illustrate his observation that the markings usually relied upon to distinguish the species are not constant, and therefore, if taken alone, of no value for the purpose of identification. He also exhibited specimens of trout from Otago, New Zealand, descendants of some which had been introduced there, presenting some curious modification of structure. A discussion followed, in which some interesting remarks were made by Professor Howes and Mr. Willis Band.

On behalf of Mr. Miller Christy, the Botanical Secretary, Mr. B. Daydon-Jackson, exhibited some specimens of the *Bardfield Oxlip*, *Primula elatior*, *Jacquin*, gathered near Dunmow, and occurring only in this part of England (cf. *Transactions Essex Field Club*, iii., p. 148).

Mr. A. D. Michæl read a paper on the life-histories of the *Acari Glyciphagus domesticus* and *G. spinipes*. After describing in detail observations and dissections extending over three years, the author concludes that there is a hypopycal stage in the life-history of *Glyciphagus*, but far less developed than in *Tyroglyphus*, and not an active stage in the species observed; that it does not occur to all individuals of a species, and it has not been ascertained whether it occurs in all species; that the stage is not the result of desiccation or unfavourable conditions; and that it occupies the period between the penultimate ecdysis and that immediately previous. Dr. C. Stewart having criticised Mr. Michæl's researches in favourable terms, a communication was made by Mr. C. B. Clarke on "Root Pressure." He contested the view of Sachs and his followers, that root pressure is sufficient to sustain the weight of a column of water of the height of 100 (or even 300) feet, and to force out drops at particular points of the leaves. He maintained that it was a mathematical error to apply the equation, $p = \rho g h$, to the case of water in plants, and that in a collection of cells and longitudinal tubes of varying size (all very small), the only mechanical ideas that could be applied were those of capillary attraction and motion. In the discussion which followed Professor Marshall Ward thought root pressure necessary to explain the admitted results of manometer experiments; Mr. A. W. Bennett, on the other hand, regarded the assumption of a high fluid tension in the cells of roots to drive moisture to the summits as nothing more than an expression of our ignorance as to what the water does move.

A paper "On the Ovicells of some Lichensporæ" having been read by the Zoological Secretary, Mr. W. Percy Sladen, in the absence of the author, Mr. A. W. Waters, the meeting adjourned to May 24.

COLONIAL NOTES.

SEED GROWING AT RANGIORA, NEW ZEALAND.

MR. J. SHIEL, seed merchant, of Rangiora, has within the past two years successfully established an industry in the shape of seed-growing for home and Continental houses which bids fair to become of considerable importance. Coming to the colony between two and three years ago, and starting in business at Rangiora, Mr. Shiel was much impressed with the superiority of many of the locally-grown vegetables and farm seeds, over those imported, and being well acquainted with the requirements of the seed trade at home, the idea of growing seeds specially for exportation forced itself upon him as

likely to prove a profitable undertaking. In deciding to put the idea into practical shape he determined that his venture should not be altogether of a speculative character, and so communicated with some of the leading firms in England and on the Continent of Europe, submitting samples of what the soil in his neighbourhood would produce, to test whether support would be forthcoming. Old-established firms, with a reputation at stake, use the utmost care in obtaining and growing their stock, and naturally require the best of references before admitting into their warehouses seed grown in so distant a country as our own. Mr. Shiel managed, however, to obtain the good opinion of more than one firm, who forwarded him supplies of selected seeds, the growing of which last year proved highly satisfactory to all concerned. The result was, in fact, so encouraging that this year Mr. Shiel has no less than 50 acres of seeds growing to order. No small amount of his success is due to the adaptation of the soil to the seed, careful sowing, "roguing" and reaping. The "roguing," or culling bad and impure seed from the crop, is one of the most important points in seed-growing, and one that entails a considerable amount of tedious labour. Mr. Shiel's crops are this year situated at Rangiora, Woodend, and on the Maori Reserve, the land being all of the best class. A good proportion of the 50 acres is under Peas, which comprise sixteen varieties of the main crop leading sorts, including Veitch's Perfection, Hair's Mammoth Yorkshire Hero, Stratagem, Laxton's Omega, Fillbasket, and G. E. Wilson. The Stratagem and Laxton's Omega are of comparatively recent introduction, and from the high character they bear as heavy croppers, with quality and size of Pea, they must, when better known, find a first place with the market gardener. The early sorts, Little Gem, Bliss' Abundance, William Hurst, American Wonder, and Blue Peter take the lead for the very early market, and of these the William Hurst, a new Pea, should have premier position, being a wonderful cropper on a stem about 9 inches high. The Peas are now being harvested in first-class condition, and will give a heavy yield. Broad and Green Windsor Beans are also grown. The variety Shiel's Border Hero, introduced into New Zealand last year, is showing well to the front for size of pod and Beans, many of the pods measuring from 12 to 15 inches in length. All the principal varieties of French or Kidney Beans and Scarlet Runners have a place, and also the white Haricot Bean so extensively used in France and England in a dry state. Carrots of the Short-horn, Intermediate, Woodberry Perfection, and Giant White Belgian varieties, are largely grown; and from the appearance of the well-set heads a promising crop may be expected. Of Potatoes there is a good collection of the best early varieties, including Ayrshire Hero, a very prolific secondary of kidney shape, with dwarf-growing top. This is a Potato at present very little grown, but wherever it has been exhibited at shows in competition it has taken a first place. Lettuce, Onion, and other small garden seeds have also space allotted to them, and Mangels of the Long Red and Yellow Globe varieties. An area of the large Scotch Tare, uncommon in New Zealand, is looking perfection in size of stalk and seed-pod. As fodder for pigs, horses, &c., this Tare is much superior to the English variety, yielding 50 to 75 per cent. more, the stalks sometimes reaching over 5 feet in height. The seed was imported by Mr. Shiel last year to be grown for distribution in New Zealand, he believing that it will supersede the English variety when it becomes better known. *Canterbury Times*, February 3.

[Mr. Shiel, a ten years' subscriber to our journal, sent the following note with the above excerpt from the Colonial newspaper. Ed.]—

"Only within the last two years have I taken notice of the importance of seed-growing in North Canterbury for Colonial consumption, as well as for the home markets, and from experience gained during that short term I am perfectly satisfied that no other country in the world can compare more favourably for this industry than can New Zealand,

The free and fertile soil of this district particularly is admirably suited for seed growing, and as these crops, to a large extent, depend upon sunshine and dry autumn weather, nothing can be more conducive to perfection of ripening than can New Zealand from the month of November till well into May. The only drawback in this country against competing with European growers of small garden seeds is the excessive high rate of wages to be paid for farm labour. In many instances farm labourers have to be paid from 5s. to 7s. per day of eight hours, and as junior labour is almost impossible to be obtained at any rate of wage, owing to their ideas being far in advance of labouring, profitable small seed growing can only be undertaken for colonial trade. To give you an idea of the superior quality of Peas grown here I will send a small parcel of samples of a few varieties without any preparation whatever, with the s.s. *Ioania* sailing next week for London. These samples are as they left the winnowing machine, without being picked in any way, all of which I am sure can bear favourable criticism. My reason, and only one, for submitting this report is to bring the industry publicly before the growers in England; and should you view it favourably I shall be very pleased if you could find for it a place in the columns of the *Gardeners' Chronicle*.

Obituary.

JOHN GREENSHIELDS.—Three years ago we recorded in this paper the retirement from active duty of Mr. John Greenshields, Lord Dacie's gardener at Sarsden, Oxon, after a service of a little over fifty years. We have now to record his death, which took place at Sarsden Gardens, on Saturday, May 12. He was in the eighty-sixth year of his age. He was appointed head gardener at Sarsden in 1834, succeeding Mr. Pugh, who then retired on a pension. These two held, in immediate succession, this appointment for 109 years. Is there another such record? Mr. Greenshields enjoyed fairly good health till two months ago. He was fond of reading, and he gave the years of his retirement wholly to this, and he could read without spectacles. He was a man held greatly in honour by those whom he served, and by all who knew him. He was a Lanarkshire man, but left his native vale of Clyde so long ago as 1827.

WILLIAM THRELFALL.—The *Times* says:—"About the end of March, drowned while bathing in the River Diyala, Kurdistan, in which district he was travelling for botanical research, WILLIAM, second son of the late Richard Threlfall, of Hollowforth, Preston, Lancashire, aged twenty-five years. Interred in the English Cemetery, Bagdad, April 7." This is a very serious loss for botany and horticulture, as well-founded expectations were entertained as to the success of this gentleman. Mr. Threlfall was a correspondent of this journal, and furnished interesting notes on horticultural and botanical matters in Germany and Russia to this journal, and we were looking forward with eager interest to the results of his travels in Asia Minor, of which he had promised to send us an account as well as specimens of the vegetation.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending May 14, is furnished from the Meteorological Office:—

"The weather has been much finer than that experienced for many weeks past. The sky, excepting in the extreme north of Scotland, has been comparatively cloudless and rain almost entirely absent.

"The temperature, although sometimes high for the season during the day, fell quickly during the night-time, and on the whole has continued below the mean in all districts, the deficit ranging from 1° in 'Scotland, E.,' to 4° in 'Scotland, N.,' 'England, E.,' 'England, N.W.,' and 'Ireland, N.' The highest of

the maxima, which were recorded on the 8th at some stations and on the 13th at others, varied from 57° to 68° in Scotland, 61° to 66° in Ireland, and from 63° to 73° over England. The lowest of the minima, which were registered on the 9th in Ireland, the 10th in Scotland, and the 13th in most parts of England, ranged from 28° in 'Scotland, W.' and 'Ireland, N.' to 32° in 'England, S.' and to 43° in the 'Channel Islands.' Over all the more inland parts of the kingdom sharp ground frosts were experienced.

The rainfall has been less than the mean in all districts, the fall in most places being scarcely appreciable.

"Bright sunshine shows a very large and general increase. The percentage of the possible amount of duration, which varied from 24 in 'Scotland, N.' to 46 in 'Ireland, S.' and to 78 in the 'Channel Islands,' has not been so high over the kingdom generally since the week ending June 27, 1887, although that for the week ending August 8, 1887, was nearly as high."

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (Above or below the Mean for the week ending May 11), ACCUMULATED (Above 42° for the Week, Below 42° for the Week, etc.), and Day-deg. for various regions like SCOTLAND, ENGLAND, IRELAND, etc.

Table with columns for DISTRICTS, RAINFALL (More or less than the Mean for the Week), BRIGHT SUNSHINE (Percentage of possible duration for the Week), and Teeths of Inch for various regions like SCOTLAND, ENGLAND, IRELAND, etc.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING MAY 23. (AVERAGE OF FORTY-FOUR YEARS.)

Table showing mean temperature for May 20-23 and the mean for the week, with values ranging from 55.5 to 56.7.

NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, DO PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR.

ACACIA TREES: A. Evans. Please send specimens of insects and bark for inspection.

A THOUSAND MARÉCHAL NIELS ON A TREE: Wm. Thomas, The Elms, Taunton. The flowers sent were very fine ones, denoting a plant in the highest vigour.

CORRECTION: SCOTTISH PRIMULA SHOW.—At p. 599, last week, instead of "Mr. Kildour, Blair Adam," read "Mr. K., Blair Drummond." The mistake arose from an incorrect prize-ticket being put on the exhibit.

DANDELIONS AND PLANTAINS ON LAWN: C. H. E. Spudding out the roots in their entirety, putting fresh loam in the holes, and sowing Grass seeds on it, is the best remedy at this season.

HARD WATER: Correspondent. If a certain proportion of lime in powder be added to the water, and well stirred in it, allowing the lime held in solution to unite with the added lime to settle, the water will be much improved for all purposes.

HOLLYHOCK DISEASE: F. W. F. Yes, a bad case. Burn every plant. In your case, if all the plants are as bad as the sample sent, it is of no use to try remedies.

LILY DISEASE: J. L. Next time send your letter to the Editor. Your plants are suffering from the attacks of a fungus like that which affects the Potato. Burn the plant.

NAMES OF PLANTS: J. G. Double Banksian Rose.—Mill & Tweedie. Drimys aromatica.—A. W. Cardiospermum halicacabium.—Sir C. W. Strickland. Barometra columellaris. We cannot name the Jasmine. Should like to see more, with lower leaves.—Ross, Castagnolo. Morca tricuspis, Ker.—E. Johnson. 1, Salvia gesnerioides; 2, Phlox subulata; 3, Diplacus glutinosus; 4, Pimelia Hendersonii; 5, Diosma spærocephala.—C. E. Gentiana amarella Fuchsia; 1, Thuia dolobrata; 2, perhaps Wellingtonia; 3, Abies Pinsapo; 4, A. nobilis; 5, Cupressus; 7, Thoa aurea. It is next to impossible to name coniferous trees from such scraps.—W. W. Forms of Lælia purpurata, Lycaste Harrisonia, Odontoglossum Cervantesii.

ODONTOGLOSSUM CRISPUM: W. W. The peculiarity is due to the growing together of three flowers.

SEEDING CINERARIAS: W. A. R. These plants seed best when kept in a dry, warm, brisk atmosphere, with plenty of sunlight.

VINE INSECT: A. B. Sirex gigas (the Giant Sawfly), usually found in woods, where it does much mischief. See figure in Gardeners' Chronicle, August 13, 1887.

CATALOGUES RECEIVED.

T. S. WARR, Hale Farm Nurseries, Tottenham—Dahlias, Climbers, &c. JAMES VEITCH & SON, Royal Exotic Nursery, 544, King's Road, Chelsea, S.W.—Plants, Novelties, &c.

S.—D. B.—Constant Reader.—F. Russell.—L. H.—C. W. D.—J. G. W.—C. J. R.—W. Radley (next week).

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

DIED, at Bordighera, Italy, Mr. R. VALENTINE LEACH, of Devizes Castle, at the age of eighty-two years.

May 12, at The Gardens, Sarsden, Mr. JOHN GREENSHIELDS, aged eighty-five years, for over fifty years Head Gardener at Sarsden House.

MARKETS.

COVENT GARDEN, May 17.

BUSINESS STEADY, with all classes of goods well supplied. Prices lower all round. James Webber, Wholesale Apple Market.

We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal subscribers, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. ED.]

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various plants in pots, including Aralia Sieboldi, Azalea, Bouvardias, etc., with prices in s. d. and s. d. s. d.

OUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various out flowers, including Anemone, Fuchsia, Geranium, etc., with prices in s. d. and s. d. s. d.

*. Orchid bloom is great variety, but the demand not very good.

REDDING-OUT PLANTS.

By the box, 2s. to 6s.; or by the dozen, 1s. to 2s. Now coming good.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing prices for various fruits, including Apples, Grapes, Kent Cobs, Lemons, Melons, Peaches, Pears, etc., with prices in s. d. and s. d. s. d.

VEGETABLES.—AVERAGE RETAIL PRICES.

	s. d. s. d.		s. d. s. d.
Artichokes, p. doz.	6 0	Mushrooms, punnet	1 0- 1 6
Asparagus, Fr., bund.	1 0- 5 0	Mustard and Cress,	
— English, 100	12 0	punnet	0 4- ...
Beans, Kidney, lb.	2 6	Onions, per bushel	9 0
Beet, red, per dozen	1 0- 2 0	Parsley, per bunch	0 6
Carrots, per bunch	0 8	Potatoes, per cwt.	4 0- 5 0
Cauliflowers, each	0 3	" kidney, per cwt.	4 0- 5 0
Celery, per bundle	1 6- 2 6	Rhubarb, per bundle	0 4
Cucumbers, each	0 9- 1 0	Seakale, punnet	2 0- 2 6
Endive, per dozen	2 0	Shallots, per lb.	0 6
Green Mint, bunch	1 6- 1 8	Spinach, per bushel	4 0
Herbs, per bunch	0 4	Spruce, per bundle	1 0
Leeks, per bunch	0 6	Tomatos, per lb.	4 0
Lettuce, per dozen	1 6	Turnips, per bunch	0 6

POTATOS.—All old Potatos lower by 10s. to 20s. per ton. New stuff very plentiful. Kidneys, 15s.; Rounds, 9s. per cwt.

SEEDS.

LONDON: May 16.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report to-day's market thinly attended, with but little business doing. For those seeds needed for immediate sowing occasional orders still come to hand; meantime prices all round are exceedingly low, and stocks quite moderate. Accounts from America speak badly of the growing Clover crops; no speculation of importance has, however, yet sprung up. Canary and Hemp seed sell on former terms. Blue Peas are steady. Rape seed commands more money. Mustard unchanged. Scarlet Runners are cheaper.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended May 12:—Wheat, 31s. 5d.; Barley, 32s. 4d.; Oats, 16s. 9d. For the corresponding week in 1887:—Wheat, 33s. 6d.; Barley, 22s. 9d.; Oats, 16s. 7d.

FRUIT AND VEGETABLES.

SPITALFIELDS AND COLUMBIA: May 16.—Fair supplies of fresh vegetables; good demand. Large supplies of old Potatos, best samples only being in request. Quotations:—Asparagus, 1s. to 2s. per bundle; Cauliflowers, 5s. to 8s. per tally; Cabbages, 4s. 6d. to 8s. do.; Broccoli, 3s. 6d. to 4s. per bushel; Spinach, 1s. 3d. to 2s. per sieve; Turnip-tops, 1s. 6d. to 3s. per sack; Greens, 7s. to 8s. 6d. per dozen bunches; Turnips, 2s. to 3s. do.; Carrots, 2s. 6d. to 4s. do.; Parsley, 1s. 6d. to 2s. do.; Mint, 2s. to 3s. do.; spring Onions, 2s. to 3s. do.; Radishes, 1s. 6d. to 2s. do.; Rhubarb, 1s. to 1s. 6d. per dozen bundles; Seakale, 1s. to 1s. 6d. per punnet; Horseradish, 10d. to 1s. per bundle; Endive, 9d. to 1s. 6d. per dozen; Beetroots, 8d. to 1s. do.; Cabbage Lettuces, 8d. to 1s. 6d. do.; Mustard and Cress, 2s. per dozen baskets; English Onions, 6s. 6d. to 8s. per cwt.; foreign, do., 4s. 6d. to 6s. per bag of 110 lb.; Carrots, 35s. to 90s. per ton; Swedes, 26s. to 32s. do.; English Apples, 5s. to 9s. per bushel; American, do., 17s. to 25s. per barrel.

STRAFORD: May 15.—Supply has been good, and a brisk trade was done at the undermentioned prices:—Greens, 8s. to 10s. per dozen bunches; Turnips, 3s. to 3s. 6d. do.; Carrots, household, 60s. to 80s. per ton; do., cattle feeding, 24s. to 25s. do.; Mangels, 17s. to 21s. do.; Onions, Egyptian, 7s. to 8s. per cwt.; Watercress, 6d. to 8d. per dozen bunches; Radishes, 4d. to 9d. do.; Broccoli, 2s. 3d. to 2s. 6d. per bushel; Wallflowers, 2s. to 3s. per dozen bunches; Onions, 3s. to 4s. do.; Asparagus, 1s. to 3s. 6d. per bundle to mint, 3s. per dozen bunches; Rhubarb, 1s. 9d. to 3s. per dozen bundles; Cucumbers, 2s. to 2s. 6d. per dozen.

POTATOS.

BOROUGH AND SPITALFIELDS: May 15.—Supplies are in excess of demand, prices are irregular and depressed, except for primest selected samples. Quotations:—Regents, 50s. to 110s.; Magnum Bonnums, 40s. to 70s.; Dunbar, 80s. to 100s.; Champions, 30s. to 60s.; Dutch Rocks, 55s. per ton. New: Malta round, 12s. to 14s. per cwt.

SPITALFIELDS AND COLUMBIA: May 16.—Quotations:—New: Malta kidneys, 13s. to 16s.; do., rounds, 8s. to 10s. per cwt.; Guernsey kidneys, 6d. per pound. Old: Magnums, 40s. to 55s.; Champtions, 35s. to 45s.; Imperators, 60s. to 80s.; Presidents, 60s. to 80s.; Regents, 45s. to 60s. per ton.

STRAFORD: May 15.—Quotations:—Scotch Magnums, 65s. to 85s.; English do., 50s. to 75s.; feu-lands, 45s. to 55s. New: rounds, 9s. to 11s.; kidneys, 11s. to 13s. per cwt.

"ARCHIMEDEAN" AMERICAN LAWN MOWERS.

AWARDED HIGHEST PRIZE AT THE

Paris Exhibition, 1878;

and the JURY, in their REPORT, say:—
"The 'ARCHIMEDEAN' did the BEST WORK of any Lawn Mower exhibited."

ALSO AT
Sydney Exhibition, 1879-80
AND AT
Melbourne Exhibition, '80-1

Opinions of the Press:
"Far superior to any of ours."—*Vide The Field.*
"Remarkably easy to work."—*Vide Gardener's Magazine.*
"The quickest, most simple, and most efficient mower ever used."—*Vide Gardener's Chronicle.*
"We feel bound to recommend it to our readers as one of the best mowers we have as yet made acquaintance with."—*Vide Floral World.*

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used STANDEN'S MANURE for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—C. M. HOVEY, Boston, U.S.A., May 27, 1887."

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in KEGS, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS—

CORRY, SOPER, FOWLER & CO.
